PREFACE.

THE volume of this work for 1881 is the sixth of the new series and the twenty-first of the whole series. It has grown in size to meet the increased activity in human affairs, and to present the interesting public questions and scientific developments which have arisen, and the discussions of their principles.

A special article is devoted to the affairs of each country and to each State of the United States, which contains a sketch of its history during the year, the administration of its government, and its legislation; full official information on its area, population, education, military force, commerce, industry, finances, and the public questions agitated and reforms effected. No efforts are spared to secure the fullest information from all parts of the world, and it is considered that in its several departments the work may be safely consulted as the completest and most reliable book of reference. At the same time its record of scientific developments and progress will be found most valuable and unsurpassed.

In this volume the sad history of the fatal wounding and slow decline of the President are given in the article on "Garfield," a summary of the points in the trial of the murderer is recounted, the important medico-legal question of "Insanity as a Defense" is discussed, and the constitutional question of "Presidential Inability" is presented, with the views of public men.

The change of administration, the "legislation of Congress," with the debates, the "special sessions" and proceedings of the United States Senate, and the records of each of the States, and especially the political history of New York, are given fully. The movements and statistics of "Commerce and Finance in the United States," and the "Finances" of the Government of the latter, by ex-Assistant Secretary Upton; the "Exposition of Cotton Products at Atlanta," by Professor William M. Browne; the report of the "Mississippi River Improvements"; "the Panama Canal question"; the important diplomatic correspondence of "Peru, Chili, and the United States"; the question of "Bi-metallic Currency" with the results of the conference at Paris; the recent progress of "American Constitutional Law"; the validity of the "Naturalization Papers of the United States"—are subjects of permanent and historical importance.

The stirring events which have occurred in foreign countries are scarcely of less interest. The agrarian question in Ireland as well as in the other coun-

tries of Europe; the wars in South America, Afghanistan, the Transvaal, and Turkistan; the revolutionary upheaval in Russia and the terrible murder of the Czar; the persecutions of the Jews in Germany and Russia; the developments of the still unsolved Eastern question; the social reforms in Germany; the rapid political changes in republican France; the liberal movements in Italy and Spain—are a few of the subjects of which an account is given, together with all the latest statistical information, under the names of the different countries, or dealt with in special articles, such as “Jews, Persecutions of”; “Islam, the Future of”; “Brahmo Somaj”; “Land Tenure in Europe”; “Opium-Trade of India and China”; “Russian Government, its Features.”

Religions and denominational information is given under the names of the denominations, and a special article on the “New Testament Revision.”

There are biographical articles on numerous distinguished persons who have died during the year.

The progress of science, particularly of its useful applications, and the achievements of inventive genius, are described with comprehensive completeness. Of the long list of special articles and new subjects may be mentioned as examples, the progress of “Medical Science and Practice,” the article on “Eye-sight Deterioration,” the one on the progress of “Mechanical Engineering,” the recent developments in “Physiology”; the account of the “Exhibition of Electrical Inventions” at Paris, the article discussing “Technical Education,” the account of the improvement in “Photography,” the articles on “Glucose”; “Germs, Vaccination with Disease”; “Fertilizers” by Professor W. O. Atwater; “Chlorophyl”; “Oysters, Deterioration of”; “Nutritive Elements of Food”; and the merits and demerits of “Silo, or Ensilage,” by L. B. Arnold.

The subject of the United States census is treated in the volume with great fullness in its various departments, and the population is given of every county in each State, and also of all the principal cities, and compared with the statistics of the former census of 1870. The returns of the recent census in Great Britain, in France, in Italy, Switzerland, and other European countries, are presented to the latest dates practicable. Large and very finely colored maps accompany the United States census, and illustrate the comparative density of the population in 1830 and 1880; the center of population at the end of each decade since 1800; and also the comparative density and the location of the foreign and the colored population.

Fine steel portraits of President Arthur, ex-Secretary Blaine, the lately deceased poet Longfellow, and the distinguished French citizen Gambetta, embellish the volume, together with maps and cuts in various articles.

THE ANNUAL CYCLOPÆDIA.

A

ADVENTISTS. The several denominations of Adventists in the United States trace their origin to the preaching of William Miller, who predicted about 1840, as the result of his studies of the prophecies of Scripture and the calculations deduced therefrom, that the second coming of Christ should be looked for in 1843 or 1844. They agree in the expression of the belief that the visible personal second coming of Christ is near at hand, but are divided, on other points of doctrine, into four branches, the most numerous of which are the Second Advent Christians, numbering about fifty thousand members. The distinctive features of their belief are "the doctrine of the immediate personal coming and reign of Christ on the earth; holiness of heart; the unconscious state of the dead; their literal resurrection; and the final destruction of the wicked." The Evangelical Adventists, numbering about nine thousand members, differ from these, in holding to the conscious state of the dead, and the eternal conscious suffering of the wicked. The Seventh-Day Adventists, who have about fifteen thousand five hundred members, hold that the sanctuary to be cleansed is not the earth, but the heavenly sanctuary; that Christ will come as soon as he completes his "investigative judgment" to ascertain who of the dead are worthy of the first resurrection, and who of the living of translation. Satan is then to reign in the earth a thousand years, after which the earth will be redeemed and fitted to be the dwelling-place of the saints. The Life and Advent Union holds to the life in Christ only, and the non-resurrection of the wicked dead.

SECOND ADVENT CHRISTIAN ASSOCIATION. The Second Advent Christians have, until the last year, been represented by two distinct organizations, one for the East and one for the West. Representatives of both branches of the denomination were invited by the Eastern Association to meet at Worcester, Massachusetts, in a National Convention, "for the purpose of considering a proper system of organiz-

ing churches and a declaration of principles." The convention met April 6th, and was attended by ninety-three delegates from the New England States, New York, Pennsylvania, and Canada. A declaration of principles respecting creed and church organization and a form of "advisory covenant" were adopted. The first four articles of the declaration state the commonly received "orthodox" doctrine of the Scriptures and the Trinity. The fifth article declares that Christ died to save men from eternal death, the penalty of violated law; that the redemption he provided is twofold—"redemption of all men from the penalty of Adam's sin, by the resurrection of the dead; second, the redemption of believers from personal sin and its consequences." The sixth, seventh, and eighth articles treat of repentance, of baptism (concerning which it is said that pardoned believers should be "buried with Christ in baptism," to show their belief in the resurrection of Christ and the dead), of the Lord's Supper, and the personal return of Christ. The tenth article expresses belief in the everlasting destruction of the finally impenitent, and the final extinction of all evil. The eleventh article declares that the coming of Christ is near at hand. The twelfth and thirteenth articles express the belief that the earth will be made over to be the future abode of the saints, and that all church action should point to the personal coming of Christ. In the "advisory covenant" the Bible is accepted as the only rule of faith, and liberty of thought is permitted, with a reservation, for the protection of the privilege of a refusal of sanction to the "persistent urging of doctrinal themes" not "essential to salvation." The articles on the subject of church organization approve the congregational system.

A conference of Second Advent Christians representing six States, met at Foreston, Illinois, in June, and adopted resolutions on church organization; a declaration of principles in harmony with that set forth at Wor-

cester; and a basis of union between Eastern and Western Adventists.

The twenty-second annual meeting of the Second Advent Christian Association—the first regular meeting of the united organization—was held at Chelsea, Massachusetts, August 16th. The following conferences were represented: Maine, New Hampshire, Massachusetts, Vermont, Connecticut, Rhode Island, Hoosick Valley, New York, Ohio, Michigan, Philadelphia, Illinois, Wisconsin, Northern Central Missouri and Southern Central Iowa, Southwestern Missouri and Northwestern Iowa, Minnesota, Kansas, California, Alabama, and South Carolina. E. A. Stockman presided. The most important business transacted was the adoption of the constitution for the united organization. This statute declares that the society shall be known as the

"Second Advent Christian Association of America," and that its object shall be "the promulgation of Bible truth, especially the fulfillment of prophecy relative to the immediate second personal advent of our Lord, and a preparation for the event, through the Advent Christian Publication Society and all other laudable means."

The association was divided into two districts, the Eastern and the Western districts, having the western boundary of the State of New York and Pennsylvania as the line of division between them; the annual meetings to be held alternately in either section. Each conference in the United States and Canada is entitled to one delegate as a member of the association, with one additional delegate for every three hundred members of churches; and single churches, where there are no conferences, may send delegates. Provision is made for the representation of distant conferences by proxy; and a committee of six delegates was constituted in either section to represent all such part of that section as may not be otherwise represented, when the annual meeting is held in the other section.

The Advent Christian Publication Society returned a capital of \$14,438, and reported that its receipts for the year had been \$20,480. It had handled during the year \$4,339 worth of books and tracts, and had published 4,333,072 pages. The sales amounted to \$4,803, and gifts had been made through the tract fund to the amount of \$1,820.

AFGHANISTAN. A British garrison occupied Candahar at the beginning of the year. In the Queen's speech at the opening of Parliament in January, the incoming British Cabinet announced its intention of withdrawing the troops from the country. Lord Beaconsfield, in criticising the sudden reversal of his policy, protested against the impairment of the imperial prestige and renown in the Orient by the course of the Government in "doing everything they could to inform every being in Central Asia, and in every other part of Asia, that they meant to cut and run from the scene of a splendid conquest," and declared that the

abandonment of the military domination of the country had produced a state of anarchy, and that the final retirement from Candahar would give full license to military adventurers ambitious of empire.

The nature of the negotiations between Shere Ali and the Russian authorities were revealed in a secret correspondence which was captured at Cabool. The menacing preparations of Lord Lytton for the invasion of Afghanistan had led Shere Ali to appeal to Russia for aid, and an offensive and defensive alliance was in negotiation while hostilities between England and Russia were imminent; but after the signature of the Treaty of Berlin, the Russian envoy at Cabool, Colonel Stoletoff, only sought by equivocations, and by counseling the Ameer to remain at peace, to extricate his government from the position to which it was committed. The history of the Afghan war shows the impossibility of either power occupying the Afghan country as a military base. The indomitable mountain tribes are only bound together by a loose fœdal league. The Ameer is little more than a titular sovereign, and there is no habitual and disciplined submission to a central organized government. Their fierce spirit of independence will not brook the thought of foreign ascendancy. An ameer would lose the allegiance of his subjects who should succumb to any European influence. The threatened advance of the English was all that made dealings with Russia possible. The adherence given to Ayooob Khan by wide sections of the country was mainly owing to the fact that Abdurrahman had been the choice of the British conquerors.

The Liberal party in England, adhering to the conviction that a "strong, friendly, and independent Afghanistan" is the best bulwark against the Russian advance toward India, recorded a solid vote in the House of Commons against a motion to retain Candahar, prompted by the intelligence of the capture of Geok Tepe by the Russians. The evacuation of Candahar and Southern Afghanistan was still delayed, in the hope that the Ameer would gather the political strength to occupy the country and cope with his adversary and England's foe, Ayooob Khan. The son of Shere Ali had seemingly better chances of uniting Afghanistan under his rule than Abdurrahman. He was the candidate of the numerous Duranis, with a considerable following among the Ghilzais, and with partisans in all the valleys of Afghanistan. His rule was established in Herat, and his pretensions acknowledged throughout Western and Southern Afghanistan. He was raising treasure and recruiting his army from the bravest elements of all parts of Afghanistan, in strenuous preparation for a struggle with Abdurrahman. The feudalitary sirdars who embraced his cause with their bold and turbulent followers, however, possessed their share of the proverbial jealous, rebellious, and faithless spirit of the Af-

ghans. His yoke was hard on the country around Herat. Treasure could only be raised by harsh exactions, and Ayoob's own imperious, jealous, and vindictive character was calculated to raise up many enemies. In March, an insurrection of the neighboring tribes, joined by mutineers from the army, Candahari and Herati soldiery, nearly put an end to his ambitious plans. His position in the country at large seemed, nevertheless, to be growing stronger. The prolonged occupation of Candahar by the British visibly injured the prospects of Abdurrahman by ranging the patriotic and religious sentiment of the country on Ayoob's side. The Ameer's rule extended only over Caboolistan, Balkh, and Badakshan, and was not exercised farther west than Ghazni.

After waiting until April for Abdurrahman to become strong enough to hold Candahar, the British authorities sent word to him to bring a force to succeed them. A deputation from Ayoob Khan asking that the city be resigned to him and his pretensions recognized, on the ground that the people were attached to his cause, was dismissed with a refusal. The Ameer dispatched a body of troops, who slowly made their way from Cabool through the unfriendly Durani country. On the 21st, after furnishing the Afghan troops with some artillery and small-arms, the last detachment of British soldiers marched out of Candahar, leaving the deputed governor of Abdurrahman in command.

The British did not, however, withdraw to their former boundary, but only to the valley of Pishin, where they remained, guarding the Khojak pass and garrisoning the city of Quetta, quietly looking on during the ensuing struggle between the two claimants for the Afghan throne. The Indian official world insisted upon holding on to this last, poor trophy of the conquest; and the army clique and Russophobists never ceased to cry for a return to the "forward" policy, for interference between the combatants, and the establishment of a British protectorate in Afghanistan.

After the evacuation of Candahar the Ameer increased his fighting strength, and posted troops on the Helmand to defend his acquisition. Three of Ayoob's cousins and generals advanced with a small force, hoping to incite the Durani chiefs to rise, but with little success. A skirmish near Girishk opened hostilities on the 30th of June. On the 11th another engagement took place, resulting in the dispersion of Ayoob's force. In July Ayoob advanced from Herat to the Helmand River with all his forces. Several days were gained by him in pretended negotiations for peace. Gholam Hyder, the commander of the Ameer's force on the Helmand, finally crossed the river to attack Ayoob Khan, but only to find that the wily prince had himself forded the Helmand and slipped in between him and Candahar. Gholam Hyder recrossed the river at Girishk, and caught up with Ayoob at Karez-i-Atta, six

miles nearer Candahar, encamped in a strong position on ascending ground. Gholam Hyder attacked him vigorously, and gained some advantage at first; but the desertion of a regiment of Ghilzais and his own bad generalship lost him the day. The Cabooli troops took to flight, and many of them came in and surrendered to Ayoob. The battle, which was fought July 27th, lasted only an hour; eighteen guns and a considerable treasure fell into the hands of Ayoob's general. The Ameer's Governor of Candahar and his staff fled, and Ayoob's forces quietly took possession of the city on the 30th. Gholam Hyder Khan retreated with the remnant of his army to Kelat-i-Ghilzai. Here, finding re-enforcements from Cabool, he made a stand. The Ameer's position improved from week to week. Dissensions broke out in Ayoob Khan's army, and many of the Cabooli soldiers who had joined him after the battle at Karez-i-Atta redeserted to Gholam Hyder. The Ameer issued a proclamation to the people of Northern Afghanistan, announcing that he would take the field in person. Mahomed Jan, his former general-in-chief, whom he had long feared and mistrusted, he cast into prison with other suspected individuals. Both he and Ayoob Khan had been hampered in their movements by signs of treachery and disaffection in their capitals and among their troops.

The Duranis did not flock to Ayoob Khan's standard, as he had hoped, upon his appearance in Southern Afghanistan. Before the capture of Candahar had made him master of the country, but few partisans joined his ranks. Here, as at Herat, his rule was felt to be oppressive. His financial straits and military necessities compelled him to make requisitions for arms and supplies and to exact transport service, and his extortions of treasure acted like a blight on commercial traffic. The murder of a popular chief, and other events which excited tribal hatred and revenge, had estranged the Herati more than all his exactions, and were among the main causes of his future disasters. Race feeling, which is one of the deepest passions of the Afghan breast, was aroused in his favor among the Southern Afghans by the appeals made by Abdurrahman to the race pride of the Ghilzai nation in his energetic preparations for a final struggle with the Ghilzai leader of a Durani horde who disputed his throne. The Duranis of the south, who had held back apathetically at Ayoob Khan's first coming, passionately filled with the traditional jealousy of the Ghilzai race, now rallied vigorously around the banner of their national chief. Abdurrahman during his struggle with Ayoob Khan was freely provided with British silver. The liberal use of his abundant cash gave him a great advantage over Ayoob. Instead of drying up the fountains of commerce, and spreading distress and poverty in his path, his approach brought unexampled prosperity and comfort to every community which he visited.

Abdurrahman reached Kelat-i-Ghilzai on the

1st of August. Definite proposals for peace from Ayoo Khan were rejected, and the Ameer advanced to join battle with his rival on the road to Candahar. For many days the armies lay encamped opposite each other; and Abdurrahman offered battle daily, but could not draw out the enemy. The Ameer was then obliged to change his camp to a position nine miles to the west, in order to be near flour-mills. Ayoo took a position opposite in the village of Chilzina. Here the decisive battle was finally fought on the 22d of September, and was lost through the treachery and desertion of the Caboolis, who had gone over to Ayoo after the defeat of Gholam Hyder, and of the disaffected Herati soldiery. The encounter with Abdurrahman, for which Ayoo Khan had been so long preparing, would probably have resulted otherwise in the overthrow of the Ameer. In the battle of Chilzina Ayoo Khan occupied a position of superior strength, behind the ramparts, ditch, and buildings of the old city of Candahar, protected on the right by a rocky ridge. Ayoo's army was also more numerous. After three hours or so of fighting, the Cabooli and Herati regiments, which Ayoo Khan probably mistrusted and therefore kept in the rear, commenced to fire upon the Ghazi and Candahari men who formed the pretender's battle-front. This treacherous act broke the line, and soon the army was in full rout. Ayoo Khan and his confederate chiefs escaped to Herat, leaving his artillery, consisting of twenty-two guns, in the hands of the enemy.

Abdurrahman did not follow up his victory, but returned to Cabool after sacking Candahar, which opened its gates to him without resistance, and pillaging the surrounding country, in revenge for their adherence to Ayoo's cause. Abdurrahman leisurely made his preparations to advance on Herat. Meanwhile Abdul Kudas Khan had set out with a small force from Cabool and was making his way toward Herat through Northern Afghanistan and Turkestan. He was joined by a large force of auxiliary volunteers from the local tribesmen, who were hostile to Ayoo. This formidable force menaced Herat from behind at the same time that Ayoo was obliged to draw his forces from the city to meet the army of Abdurrahman. After three engagements, the last one fought at Shafian, thirty miles east of Herat, October 2, in all of which Abdul Kudas and his local allies were successful, Herat surrendered without further resistance on the 4th. Ayoo Khan, after the capture of his stronghold and capital, and his sole military base, prudently made his escape to Persia.

AFRICA. An important change in the map of Africa occurred during 1881. The Transvaal Republic, which had been annexed by the British in 1877, regained its independence and assumed the name of the South African Republic. A strong agitation against British rule was kept up in the annexed district, which finally resulted in a declaration of war by the Boers.

After several severe repulses of the British, public opinion in England became outspoken against the further continuance of the war, and negotiations were entered into by the Liberal Government with the Boers, which resulted in the restoration of virtual independence. (See CAPE COLONY.)

At the biennial election held in Liberia on May 3d, Anthony W. Gardner was elected President, and Rev. A. F. Russell, Vice-President of the republic, the successful candidates receiving a majority in every county. This will be Mr. Gardner's third term. The contest is described as independent of party lines. The successful candidates have pledged themselves to the education of the masses, the incorporation of the native tribes into the body-politic, in favor of temperance, the honest settlement of foreign indebtedness, and the frugal administration of the Government.

A small native war arose for the British on the West Coast of Africa. A native, who styled himself King of the Denkera tribe, had taken refuge within the limits of the British protectorate of the Fantee and other tribes; but King Koffee, of Ashantee, claimed that the Denkeras were subjects of the Ashantees, and demanded that he be given up. As the British refused to comply with this request, King Koffee declared war in February. The affair was settled in May, after a short and decisive campaign, by the payment of a penalty of 2,000 ounces of gold, and an apology from King Koffee to Queen Victoria. At the final interview of the Ashantee ambassadors with Sir Samuel Rowe, the Governor, the latter instructed them to inform the King that the British would not consent to the conclusion of any treaty with him so long as he permitted the practice of human sacrifice to continue.

The German traveler, Nachtigal, has made a computation of the surface and population of the countries and districts of the Continent of Africa, as follows in kilometres (2½ kilometres = 1 square mile):

COUNTRY.	Area.	Population.
Morocco.....	812,383	7,829,000
Algeria.....	667,665	2,867,626
Tunis.....	111,348	2,100,000
Tripoli.....	1,083,349	1,010,000
Desert of Sahara.....	6,150,426	2,850,000
Egypt.....	295,615	17,420,000
Soodan, Central.....	1,714,983	81,770,000
Soodan, Western, and Upper Guinea.	1,998,046	43,600,000
Harar.....	1,897,038	15,500,000
Central Africa north of the equator.....	2,254,950	27,000,000
Central Africa south of the equator.....	1,717,900	20,000,000
Portuguese possessions, eastern.....	111,497	1,000,000
Portuguese possessions, western.....	75,470	0,000,000
Orange Free State.....	968,418	75,000
British South Africa.....	968,418	1,966,000
Islands.....	626,054	3,952,400
Total.....	29,283,390	205,166,976

AKKAS, a dwarf race dwelling in the valley of the White Nile, in about the third degree of north latitude. Reports of dwarf peoples in equatorial Africa have been made by travelers in all ages. The pygmies of the an-

cients were located by tradition in the distant parts of Upper Ethiopia. The Dokkos, another tribe of people of low stature, living in the southern part of Abyssinia, may be related to the Akkas. These are described by Schweinfurth as a race which never attain a greater height than five feet. Their lower face protrudes to a remarkable degree. Their hands and feet are small. They are very active in their habits, and use the bow and the lance with great skill in hunting the elephant. The country of the Akkas lies south of the Welle River, beyond Monbuttu-land and the country of the Niam-Niams (see "Geographical Progress and Discovery"). From recent accounts it appears that the stature of the Akkas has been somewhat understated, and that their average height is greater than that of the Hottentots. They are not warlike, and are in danger of extinction from the aggressions of their neighbors. Two Akka children who were brought to Europe by Miani have displayed a fair degree of intelligence.

ALABAMA. Some important measures were passed at the session of the Legislature held at the beginning of the year. A colored normal school was established at Tuskegee. An act was passed providing for the incorporation of banks of discount and deposit. They are authorized to carry on the business of banking, by discounting bills and notes, receiving and paying out deposits, buying and selling gold and silver bullion, foreign coins and foreign and domestic bills of exchange and commercial securities, bonds and stocks, by lending money upon bonds, stocks, and personal security, and upon unincumbered real property, and by exercising such incidental powers, not in conflict with the laws of the State or of the United States, as are necessary to carry on its business. The capital stock may be any sum not less than fifty thousand or more than five hundred thousand dollars.

Any one who carries about his person a bowie-knife, or any other knife or instrument of like kind or description, or a pistol, or firearms of any other kind or description, or any air-gun, must be fined on conviction not less than fifty nor more than five hundred dollars, and may also be imprisoned in the county jail, or sentenced to hard labor for the county for not more than six months: provided, that evidence that the defendant has good reason to apprehend an attack may be admitted in the mitigation of the punishment or in justification of the offense.

The sum of one hundred thousand dollars was appropriated for the construction of an additional building for the accommodation of the insane at Tuscaloosa.

The rate of the State tax was fixed at six and one half tenths of one per centum.

It was declared by the Legislature that "the main track of every railroad in this State is a public highway, over which all persons have equal rights of transportation for passengers

and freights, on the payment of just compensation to the owner of the railroad for such transportation; and any person or corporation engaged in the business of transporting passengers or freights over any railroad in this State, who shall exact and receive for any such transportation more than just compensation for the services rendered, or demands more than the rates specified in any bill of lading issued by such person or corporation, or who for his or its advantage or for the advantage of any connecting line, or of any person or locality, shall make any unjust discrimination in transportation against any individual, locality, or corporation, shall be guilty of extortion; and in every case it shall be for the jury to determine, from all the evidence, whether more than just compensation was exacted and received, or whether any such discrimination in transportation which may be established by the evidence against the individual, locality, or corporation, as the case may be, was made for the benefit or advantage of the person or corporation operating such railroad, or of any person or locality: provided, that nothing in this act shall be construed to prevent contracts for special rates for the purpose of developing any industrial enterprise, or to prevent the execution of any such contract now existing."

In all suits for extortion, the plaintiff may recover twice the amount of damages sustained, and also a reasonable fee for his counsel. The party proved guilty of the extortion may be fined not less than ten or more than five hundred dollars. It was also provided that a board of railroad commissioners should be established, whose duty it should be to consider and carefully revise all tariffs of charges for transportation submitted to the commission by any person or corporation owning or operating a railroad in this State; and if, in the judgment of the commission, any such charge is more than just compensation for the service for which it is proposed to be made, or if any such charges amount to unjust discrimination against any person, locality, or corporation, the commission shall notify the party submitting the same of the changes necessary to reduce the rate of charges to just compensation, and to avoid unjust discrimination; when such changes are made by the party submitting the tariff, or when none are deemed proper and expedient, the members of the commission shall append a certificate of its approval to such tariff of charges.

It was further made the duty of the commissioners to hear all complaints made by any person against any such tariff of rates so approved, on the ground that the same, in any respect, is for more than just compensation, or that such charges, or any of them, amount to, or operate so as to effect unjust discrimination; such complaint must be in writing, and specify the items in the tariff against which complaint is made; and if it appears to the commission that there may be justice in the complaint, or

that the matter ought to be investigated, the commission shall forthwith furnish to the person or corporation operating the railroad a copy of the complaint, together with notice that, at a time and place stated in the notice, the tariff as to said items will be revised by the commission; and at such time and place it shall be the duty of the commission to hear the parties to the controversy or by counsel, and such evidence as may be offered, oral or in writing, and may examine witnesses on oath, conforming to the mode of proceedings, as nearly as may be convenient, required of arbitrators, giving such time and latitude to each side, and regulating the opening and conclusion of any argument, as the commission may consider best adapted to arrive at the truth; and when the hearing is concluded, the commission shall give notice of any changes deemed proper by them to be made, to the person or corporation operating the railroad.

The serious nature of the litigation against railroads, under a complaint of extortion, is such that those best informed on the subject admit that, if the roads were subject to it unrestrained, it would effectually destroy the value of their property. The act, therefore, seeks to provide a proper measure of protection to the railroads by authorizing them to submit their tariffs to the commission, and when such tariffs have been conformed to what, in the judgment of the commission, is the measure of just compensation, without unjust discrimination, the commission shall approve them. This approval by the commission does not make the tariff thus approved absolutely binding, either on the public or the railroads; but it so far protects the railroads as to relieve them while acting under such approved tariff from all liability except for actual damage, and gives them the right, if successful in a suit for extortion in respect to such charges, to recover a lawyer's fee from the plaintiff, and the approval of the commission is *prima facie* evidence in behalf of the railroad that the tariff is not extortionate.

The object and effect of these provisions are to leave it to a jury to determine in the last resort what is just between the people and the railroads. The railroads, in so far as they are private property, are entitled to the same measure of protection precisely as other property; and, in so far as they are public highways, the right of the public to use them is equally sacred. These respective rights, of the success of the railroad on the one hand, and of the public on the other, meet at just compensation, without unjust discrimination, for the service rendered in transportation. Whenever the railroads are required to transfer freight or passengers for less than just compensation, the rights of the owners of the railroads are violated; and, on the other hand, when the railroads charge more than just compensation, or make any unjust discrimination in transportation, they trespass upon the rights of the public. The

trouble is, to determine what is just compensation or unjust discrimination.

The Legislature has the power to determine this matter by positive statute, as is done in the case of mills grinding for toll, ferries, toll-bridges, turnpikes, and the like; but the variations in the measure of just compensation, and not unjust discrimination, in railroad transportation, render the exercise of this power of fixing rates by positive statute impracticable.

It was made the duty of county health boards to supervise the public health, and through their health officer to collect full vital statistics of their county.

A tramp was defined to be any person who goes from place to place or house to house, begging or demanding food, raiment, lodging, or other thing of value, without employment or other visible means of support. It was further provided that the act of begging, or vagrancy, by any person having no known residence within this State, shall be *prima facie* evidence that the person committing the same is a tramp.

As a punishment, or rather to exclude them from the State, it was provided that any person convicted of being a tramp shall be fined for the first offense not less than fifty nor more than two hundred dollars, and shall be sentenced to hard labor for the county for not less than six nor more than twelve months, and, on a second conviction for such offense, shall be fined not less than one hundred nor more than five hundred dollars, and sentenced to hard labor for the county not less than one nor more than two years; and for each subsequent conviction shall be fined and sentenced as for the second conviction.

The act for the apportionment of representatives made a small change in only four counties, which merely gained or lost a member. The number of representatives is one hundred.

There were 996 bills introduced in the House, of which 221 became laws, and one was vetoed by the Governor.

In the Senate there were about 460 bills and petitions introduced, 129 of which became laws.

It will be seen that there were some 1,456 bills introduced, and only 350, or not quite one fourth, were enacted into laws. Some failed for want of time to consider them, while others were defeated in one branch or the other of the Legislature.

Of the laws passed, forty-four are general, fifty-four are amendments of the Code of 1876, and the remainder are local or special in their nature, including sixty acts for the prevention or regulation of the sale of spirituous liquors. The adjournment took place early in the month of March.

The latest report of the condition of the Educational Department is for 1880. The total revenue for the year was \$397,465.35—the largest items being the annual appropriation of

\$130,000, the poll-tax retained by the counties for the townships and *race* paying it, \$124,597.08, and interest on the sixteenth-section fund, \$105,082.66. The principal apportionments of the fund were, for the normal schools, \$13,500; to school districts, \$258,099.52, and of course the net poll-tax, as above indicated. Teachers of white schools got \$203,681.46; of colored schools, \$158,911.13; and county superintendents got \$11,871.92. The white Normal School at Florence received \$7,500; the colored Normal at Marion, \$4,000; and the colored Normal at Huntsville, \$2,000. Each one of those schools is represented as doing well, having made considerable improvements over former years. The white Normal at Florence reports on its catalogue for the year 201 pupils, and there has not been a case of serious sickness during the entire year, which closed under circumstances gratifying to the friends of the institution. Indeed, such a degree of prosperity and popularity has it attained that it was found necessary to enlarge the accommodations for an increased number of pupils. Connected with the institution, eight teachers are reported. While music is taught as in other institutions, to those who desire to take lessons, the whole school is required to join the vocal music class, and the board expresses satisfaction at the pleasing effect of this feature of the institution. The Florence Normal School, present and prospective, has never been in so prosperous and pleasant estate. There are 100 of its old pupils engaged in teaching in the State, and many more are ready and waiting.

The Lincoln Normal University, at Marion, is reported to be in a flourishing condition. The number of pupils was 140—76 females and 64 males. Such has been the increase in the number of pupils, that an enlargement of the building has become an absolute necessity. The report shows five teachers connected with the school.

The Huntsville Normal School (colored) is also reported in a flourishing condition, the average attendance of pupils being larger than that of any previous year. Professor William H. Council, one of the most intelligent men of his race in the State, is the principal of this school. He has three assistant teachers. The average paid teachers, per month, was—white, \$20.96; colored, \$23.62; the average of pupils to teacher was—whites, 33; colored, 46. The number of white schools was 3,085, colored 1,512—total, 4,597. Number of white male teachers, 1,864; number of white female, 1,230—total, 3,094. Colored teachers, male, 1,080; colored female, 441—total colored, 1,521. The total number of teachers was 4,615. Reading, writing, and spelling were the principal branches taught.

The total school population was, white, 217,320; colored, 170,449—total, 387,769. Number of enrolled whites, 107,483; colored, 72,007—total, 179,490. Average attendance of white was 67,794; colored, 50,184. Average length of white schools in days, 83; colored, 67; the

general average for white and black combined being 80 days.

The State Penitentiary, at the latest report, contained 540 convicts, of whom only 44 are kept within the walls.

The convicts for the most part are hired to miners and farmers, most of them at \$5 per month. These are the first-class hands. There is a second class that bring only \$2.50, and a few who are let for their "victuals and clothes." The report shows, however, that as fast as the \$5 contracts expire new ones are made at \$8 per month. It is worth noting here that the sum of \$45,000 has been paid into the State Treasury during the two years. Within the five years, under the present system, \$81,000 have been paid into the Treasury, \$36,000 of State bonds canceled, besides building the Wetumpka Branch Railroad, worth \$12,921.20, and making repairs and improvements on buildings and grounds worth \$12,200. Under the new contracts, the income to the State will be largely increased. Under the old law, it cost per capita about \$59 for transporting convicts to the penitentiary; now it costs about \$1.70.

Out of the 540 convicts, there is but one solitary white woman. This lone one is thirty-five years old, and was sentenced to a term of three years, for adultery.

The number of white male convicts is only 69. The colored male convicts are 450, and colored females 20. There are some children among the colored convicts, the youngest being ten years, and is sentenced to seven years for manslaughter. There is one twelve, one thirteen, one fourteen, and quite a number ranging from fourteen to twenty. The oldest convict is seventy-five; he is in for manslaughter, for five years. There is one seventy-two years old, and is in for two years for assault with intent to murder. The life-sentences are 51. The table of previous occupations of convicts shows 489 laborers, 9 cooks, 8 carpenters, 7 house-servants, 6 farmers, 3 blacksmiths, 2 engineers, 2 shoemakers, 1 hotel-keeper, 1 baker, 1 machinist, 1 jeweler, 1 brick-mason, 1 teamster, 1 sailor, 1 musician, 1 dentist, 1 painter, 1 school-master, 1 horse-trainer, 1 timber-worker, and only 1 doctor. The doctor is in for life, for murder. The table of nativity shows: Alabama, 338; Georgia, 44; and the balance scattered, 3 being put down to England, 2 to Germany, and 1 each to Ireland, Switzerland, and Canada. The crime which is most largely represented is burglary. There are 170 burglars. Grand larceny and murder stand next on the list, there being 106 names under each of these heads. In former times horse-stealing showed the largest number of convicts, but that does not seem so popular a business as formerly. there being only one horse-thief. There are quite a number for rape, and a few for arson, and nearly every other crime has one or more representatives. In the tables touching the conduct of the sev-

eral convicts, it is put down for the most part as "good." Out of 53 employed by the Newcastle Coal Company, the conduct of every one is reported "good." Out of 46 employed by C. T. Pollard, only 2 "bad" are reported for the two years. Out of 87 employed by Colonel T. Williams, the report for the two years shows 28 "bad." The number of deaths during the two years was 60; number escaped, 26; number discharged by the expiration of sentence, 274; number pardoned, 29. Among the deaths was one suicide. A necessity has also arisen for the enlargement of the Insane Asylum, and the Legislature appropriated for that object \$50,000 for two years.

The supply of coal and iron in the State is comparatively inexhaustible. During the last ten years the iron industry has increased about 700 per cent. The production of coal has also increased with great rapidity. In 1874, 49,889 tons were mined; in 1878, 194,268; in 1879, 200,000 tons; while in 1880 the aggregate ran up to 340,000 tons. This growth has been made in the face of many obstacles, the chief of which was the want of railroad facilities, and a general impoverishment of the people by the losses of the war. The value of the output in 1880 was \$2,000,000, while it is believed the year 1881 will show a product in Alabama of \$3,000,000. In various localities of the State the manufacturing industry is rapidly increasing, and the abundant water-power brought into use. Numerous cotton-mills have been constructed and are in operation; likewise oil-works, blast-furnaces, etc. The number of spindles used in cotton manufacture in the State is 55,072, and the number of bales of cotton used during the census year was 14,887. The acreage of cotton in the State during the same year was 2,329,577 acres, and the number of bales made by the crop was 699,576, which is an increase of 62.9 per cent, or 270,094 bales, over the crop of 1870, that amounted to 429,482 bales. There are 32,000,000 acres of land in the State, of which about 14,961,175 acres are in farms, 5,082,204 are under cultivation, 9,878,971, owned by individuals, lying idle for want of some one to cultivate them, and 5,200,000 acres of government lands, which yield no taxes. Continuous effort is made to have the Legislature publish these facts in the interest of immigration, and as the State had (September 30, 1880) \$286,990.14 in the vaults of the Treasury, a call was made upon legislators to use part of this sum in developing the agricultural interests now lying dormant. Immigrants in the north of Alabama have increased taxes so largely that they will in a year or two swell the Treasury receipts \$10,000. In that section grape-culture is the principal business. An acre of cuttings will in two and a half years yield 200 gallons of wine. The soil, like that of California, seems peculiarly adapted to the grape, possessing chemical and physical qualities that insure success. The climate also conspires to growth—a dry sum-

mer, with warm rains, and a warm, unclouded fall, which perfectly ripens while thoroughly developing sweetness. The amount of taxes received into the State Treasury for the year ending September 30, 1881, was \$562,500. This sum consisted entirely of taxes on real and personal estate. About one half the amount was paid by the eleven counties of Montgomery, Dallas, Mobile, Lowndes, Hale, Bullock, Wilcox, Perry, Pike, Marengo, and Lee. The board for the assessment of the railroad property in the State increased the valuation over the preceding year by \$2,068,695. The amount of additional revenue which the State will receive from this increase is \$13,446. The assessment made for 1877 was \$10,627,559. For the year 1878 it was \$10,297,023. For the year 1879 it was \$11,023,389. For the year 1880 it was \$14,526,769, and for the year 1881 it is \$16,595,462. In the last three years, therefore, the tax valuation of the railroad property of the State has increased very nearly 60 per cent. The amount of revenue the State will derive from the roads this year will be \$120,271, which is about one sixth of the entire sum derived from taxation on property. If all other property in this State was taxed as near to its value as the railroads, the revenue would be much larger than it is, and there would be no difficulty in lessening the rate of taxation.

The population of the State, according to the census of 1880, divided into several classes, has not yet been fully compiled at the Census Office. The following is the population by counties.

COUNTIES.	Population.	COUNTIES.	Population.
Autauga.....	18,108	Jackson.....	25,114

The Legislature chosen at the same election was composed, in the Senate, of 33 Democrats; in the House, 94 Democrats, 4 Independent Democrats, 1 Greenbacker, and 1 Republican.

The State was entitled to eight members of Congress, and the vote at this election was as follows:

District.		
I.	Gillette, Republican.	5,595
	Herndon, Democrat.	1,000
	Threalt, Republican.	2,303
	Mott, Greenback.	730
II.	Strobach, Republican.	8,854
	Herbert, Democrat.	13,271
	Townsend, Greenback.	52
III.	Mabson, Republican.	5,636
	Oates, Democrat.	10,614
	Zachary, Independent.	69
	Smith, Republican.	6,650
IV.	Shelley, Democrat.	9,301
	Stevens, Colored Republican.	1,693
V.	No opposition.	..
	Williams, Democrat.	9,219
VI.	No opposition.	..
	Hewitt, Democrat.	10,043
	Clements, Democrat.	9,973
VII.	Bingham, Republican.	5,111
	Forney, Democrat.	12,858
VIII.	Lowe, Republican.	12,765
	Wheeler, Democrat.	12,593

The vote for State officers at the same election was as follows:

FOR SECRETARY OF STATE.

H. M. Judge, Greenback.	37,618
W. W. Screws, Democrat.	121,375
Turpin, Greenback.	975

FOR ATTORNEY-GENERAL.

Paul L. Jones, Greenback.	25,631
H. C. Tompkins, Democrat.	121,375

FOR TREASURER.

William T. May, Greenback.	33,009
J. H. Vincent, Democrat.	121,781

FOR AUDITOR.

J. H. Cowen, Greenback.	38,852
J. M. Carmichael, Democrat.	124,781

ALASKA. Some important facts respecting the population and resources of Alaska have been obtained by the late agent, Mr. Ivan Petroff, for taking the census of that region. The entire Alaskan country as far north as the Yukon was examined, and tabulated reports are given, village by village, of the inhabitants. The people of the Territory may be divided as follows: 1. The Innuut or Esquiman race, which predominates in numbers and covers the littoral margin of all Alaska, from the British boundary on the Arctic to Norton Sound, of the lower Yukon and Kuskokvim, Bristol Bay, the Alaskan Peninsula, and Kodiak Island, mixing in, also, at Prince William Sound. 2. The Indians proper, spread over the vast interior in the north, reaching down to the sea-board at Cook's Inlet and the mouth of Copper River, and lining the coast from Mount Saint Elias southward to the boundary, and peopling Alexander Archipelago. 3. Least in numbers, but first in importance, the Aleutian race, extending from the Shumagin Islands westward to Atto—the *ultima Thule* of this country. The grand total of population is: whites, 392; creoles, 1,683; Aleuts, 2,214; Innuits of Kodiak, 2,196; of Togiak, 1,826; of Bristol Bay, 2,099; of Kuskokvim, 3,505; of Yukon, 3,359; of Behring Sea, 1,533; of the Arctic coast, 2,990; Indians, 8,401—total, 30,178.

ALEXANDER, E. B., died March 15, 1881, being a colonel in the United States Army. This meritorious officer, of whose death the

War Department was informed, became gray in the service of the Union. He was well known throughout the country, but more particularly in Missouri, having filled the office of Provost-Marshal-General of that State in an able, firm, and upright manner. His headquarters were in St. Louis in the year 1865. Colonel Alexander belonged to the old-school class of army officers, and, like many others, was outstripped in the race for rank by junior officers who entered the lists full of ardor and vigor at the outbreak of the civil war. He commanded the Utah Expedition until relieved by General Johnston, when Grant, Sherman, and McClellan were simply lieutenants, and his service extended through a period of forty years. Graduating at the West Point Military Academy, June 30, 1823, he was the next day promoted brevet second-lieutenant of the Sixth Regular Infantry, and on the 25th of December, 1827, was made a full lieutenant. He attained the rank of captain of the Third Infantry, July 7, 1848; was brevetted major, April 18, 1848, for gallant conduct in the battles of Contreras and Churubusco. At the close of the Mexican War he was promoted to be colonel of the Tenth Infantry, after which he served the Government at Santa Fé, New Mexico, and other points. At the beginning of the civil war, Colonel Alexander was stationed at Fort Laramie, and offered his services, and that of his regiment which was much devoted to him, again and again to the Government, but was retained on the frontier on account of his influence with the Indians. In the spring of 1863 he was ordered to St. Louis as Acting Assistant Provost-Marshal-General, the business of which office was to superintend the district provost-marshals, to be informed on the condition of the State, execute the draft, arrest deserters, and to superintend the mustering, in and out, of the troops. This duty was usually assigned, in the respective States, to old and tried army officers, and Colonel Alexander's performance of it, in a manner at once able, honest, and faithful, is well attested. After a life of unquestionable integrity and devotion to duty, this lamented soldier was in 1869 placed upon the retired list, having been brevetted a brigadier-general for his services in recruiting the army during the war.

ALEXANDER II, Emperor of Russia, was assassinated by Nihilist conspirators, March 13th, at St. Petersburg. Born April 29, 1818, Alexander Nicolaevitch's prospects of succeeding to the throne seemed the remotest possible. Four years afterward his uncle Constantine in family conclave renounced the succession, and in his seventh year Alexander I Pavlovitch died in the prime of his life, murdered it is supposed, and was succeeded by Nicholas, the third son of Paul I. The infant Alexander, the Czar's eldest son, was now heir-apparent, but, during the thirty years of his father's reign, his life was almost as unimportant as

that of a grand duke in a collateral line, which seemed his destined lot when in the cradle. His earliest training was directed by his mother, Alexandra Feodorevna, a sister of the present German Emperor; but his father soon withdrew him from the care of the mild, refined Czarina, and sought to inculcate in his heir the thoughts and ways of a soldier. The gentle, kindly, easy-going character of the Czarevitch, different from the arbitrary and passionate temper usually characteristic of the Romanoff family, afforded poor material for a military martinet. His tutor, the poet Shukofsky, instilled in him a love of literature and the contemplative science in vogue in Germany. He was endowed with the linguistic talent of his race in a marked degree, and acquired a familiar acquaintance with the principal modern languages. The ceremonial observances, incumbent on the heir to the throne and nominal commander in the army, formed the chief part of his public activity. At the age of sixteen he was declared of age, and appointed Hetman of the Cossacks and Commandant of the Guards. In 1836 and 1837 he traveled through Northern Russia and Siberia, where he procured the alleviation of the hard lot of political exiles. In 1839 and 1840 he visited various countries of Europe. In 1841 he was married to the Princess Maximiliane Maria of Hesse (see MARIA ALEXANDREYNA in "Annual Cyclopædia" for 1880). From this marriage came six sons (the Grand Dukes Nicholas, Alexander, now Alexander III, Vladimir, Alexis, Sergius, and Paul), and Maria, now Duchess of Edinburgh. In the following years he traveled in Southern Russia, the Caucasus, and Armenia. On one of his tours he took part in an expedition against a tribe of Circassian robbers. He held the post of Director of the Military Schools, but the duties were performed by his assistant, General Rostoftsef, who afterward took a prominent part in the emancipation of the serfs. The Czarevitch was president of one of the commissions appointed to inquire into the condition of the serfs, but gave little attention to the investigation, and favored rather the proprietors than the peasantry. Nicholas was disappointed in his son, who was overawed by his father, as was nearly every one who came in contact with that majestic autocrat. "My son Shasha is an old woman," Nicholas once said; "there will be nothing great done in his time." Had he not wisely kept aloof from state affairs, Alexander, from his very different habits of mind, might have given his father a better opinion of his strength of character by coming into unhappy conflict with the "Iron Czar." He is said to have earnestly protested against the advance on Turkey in 1853. The military schemes of Nicholas, to which he had sacrificed all the best interests of the empire, came to naught, and the Emperor died of shame and disappointment after the loss of the Crimean War. Alexander II

mounted the throne of the exhausted empire on March 3, 1855.

The spread of education in Russia had as its concomitant an extension of liberal ideas. The impressionable religious character of the Russian mind causes a reform movement in Russia to rapidly break out of the bounds of the timely and the practicable. Relieved from the repressive tyranny and the military code of the reign of Nicholas, Young Russia indulged in dreams of social regeneration which were too bright to be realized. The new Czar was in thorough sympathy with the progressive spirit of the time. The reforms which he instituted in the earlier part of his reign seemed in the minds of the enthusiastic revolutionists, who formed three quarters of the educated people of Russia, to open an era of liberty and enlightenment which was to place Russia in the van of all the nations. Alexander was not carried away with the extravagant enthusiasm which was rife; but, while proceeding with caution, he showed himself disposed to follow to the farthest practicable extent the path of social and political reform. On the 3d of March, 1863, he accomplished by his fiat one of the most gigantic and far-reaching revolutionary events of all history—the emancipation of the Russian serfs. This was the one popular reform of his reign which he never sought to modify or recall. As he was revered in his life-time by the liberated peasantry as the Czar Emancipator, so he will live in history by the same title as one of the most illustrious of his line. Besides the great act of his reign, he instituted internal reforms of great importance. To strike off the shackles of thought, to open the press for the free expression of opinion, and to rid the universities of the drill-masters who subjected professors and students to the discipline of the barracks and exercised a ruthless and ignorant censorship over the studies, was one of the earliest acts of the reforming Czar, and one of the first to be revoked. The system of education was in many particulars improved. The army and navy were reorganized. Trade and industry were specially encouraged. New commercial routes were opened. A revision of the laws was taken in hand. A judicial system on the French model was instituted, the penal code was framed, and the methods of civil and criminal procedure were greatly simplified. A new system of municipal administration was introduced. Limited rights of local self-government and taxation were accorded to districts and provinces, to be exercised by elective assemblies. It was hoped and expected that Alexander would end by conferring a constitution upon Russia, and confide to the people the control of the national destinies. Suddenly the Czar stopped short in his progressive course, reintroduced the harshest of the repressive regulations which he had abolished, and devoted the rest of his life in vainly striving to lay the spirit which he had himself invoked.

The courage with which he persisted in the reactionary policy, offending the most intelligent section of the people, and standing in hourly danger of assassination, was equal to that with which he had faced the wrath of the aristocracy in abolishing serfage. He probably made up his mind tardily that the autocratic principle was essential to the unity and happiness of Russia, and that he had imperiled it and must rescue it at all hazards. The heterogeneous races in Europe and Asia, standing on very different planes of civilization, could hardly be made the recipients of equal rights of representation in a constitutional state without swamping the culture of the very classes who were clamoring for a constitution. Then the idea of the autocracy is so bound up with the religious sentiments of the mass of the people that Alexander II probably recoiled from the responsibility of subjecting their faith and morals to the strain they would have to undergo upon his abdicating his traditional authority, and breaking off his paternal relations to his people.

Prudence and benevolence were the leading traits of Alexander's character. Without being endowed with profound sagacity, he sought conscientiously to make up his own mind in every juncture, and in every course which he chose was carried by circumstances farther than he foresaw. He had far-sighted men to advise him, but, instead of implicitly trusting to their genius, he followed in great matters his independent judgment, from a sense of duty rather than from self-confidence. He was never carried away with enthusiasm, nor over-hopeful of grand results, but was easily influenced by popular sentiment, which he gave way to as far as his cautious nature would admit. In the emancipation of the serfs his heart was thoroughly enlisted, and he acted in advance of public opinion; in everything else he followed hesitatingly, and always feeling his way. The power of Russia was rapidly extended in Asia during the whole of Alexander's reign. In 1860 a favorable treaty was struck with China, by which Manchuria was secured. In Central Asia one khanate after the other was put through the gradual process which ends in absorption into the Muscovite dominion. In Europe, Russia was silent for many years. She was not "sulking, but recruiting," Gortchakoff declared. In 1863 the Polish rebellion might have been successful but for the aid of Prussia. Then Prince Gortchakoff informed the Western powers that Russia would listen to no intercessions on behalf of the "kingdom of Poland." During the Franco-German War the keen diplomat improved the situation and repudiated the stipulation in the Treaty of Paris forbidding Russia to maintain a naval armament in the Black Sea, on the ground that treaties are only binding so long as both parties are agreed! This cool declaration placed Russia again in her traditional attitude. But for the events of

which it was the prelude the Chancellor was not responsible. He, as well as the Finance Minister, and other members of the Cabinet, earnestly tried to dissuade the Czar from his attitude to the Slav agitation which led to the Turkish War. The Emperor had no sympathy with the Pan Slavistic cause. Between him and the Philoslav party there were only mutual distrust and repulsion. But he refused to check the belligerent proceedings of the Slavonic Benevolent Society and the Moscow Slavonic Society, or to forbid his officers to volunteer in the Servian War, because his sympathies were with the Turkish Christians, and he could not in his conscience disapprove the intense popular feeling of the time. The traditional duty of the Czar to protect the Orthodox Christians of Turkey was present in his mind, not the desire of founding a Pan Slavie empire or of forcing the Eastern question and conquering the Bosphorus. He was drawn into the war without anticipating it. The speech which he made at Moscow, in which he declared that, if Europe would not secure a better position for the oppressed Slavs, Russia would act alone, he expected would serve as a menace which would be sufficient to bring Turkey to her reason. He was with the army until after the capture of Plevna, visiting the hospitals frequently and winning the hearts of the soldiers by the sincere sympathy and kindness which he showed for the sick and wounded. The grief which he felt for the misery caused by the war was recognized by the people. He was called the "Martyr" and the "Guardian Angel." Yet he refused to listen to advisers who urged the conclusion of peace before the Turkish power was broken.

The first attempt on the Czar's life was in 1866. The following year he was assaulted with murderous intent in the Bois de Boulogne at Paris. After the conclusion of the Berlin Treaty, the flames of Nihilism burst out all over Russia. It became evident that every branch of the public service, every social circle, even the higher ranks of officials, the first families of the aristocracy, and probably the imperial family itself, contained agents and friends of the revolution. A mania for desperate conspiracy seemed to rage. Heterogeneous disaffected elements sought to attain their various objects through a political cataclysm; but the authors and perpetrators of the revolutionary deeds were the Russian socialists, the most daring and resolute political conspirators of any age. Every arrest and condemnation for political crime was a provocation for acts more flagrant and defiant. In 1879 the Emperor knew that his death was compassed by the Nihilistic committee in St. Petersburg, the central source of terrorism. The Czarina died in 1879. The relations of the Czar to the Princess Dolgorouky, his determination to marry her morganatically, and the vehement opposition of his children, were the cause of additional unhappiness at the time when he felt

that the sword of Nihilism was suspended over his head. He did not shrink from the task of trying to extirpate the dangerous growth. The measures taken are described in the last two volumes of the "Annual Cyclopædia." In April, 1879, the school-master Solovieff fired four times at the Czar in the palace garden at St. Petersburg. In November the dynamite mine was exploded on the Moscow Railroad, which, owing to a change in the programme, destroyed the baggage-train instead of the carriage in which the Emperor was traveling. In February, 1880, explosives fired in the cellar of the Winter Palace would have destroyed the Czar and his guests while at dinner, had he not by a rare chance been a few minutes late. Melikoff's administration of the extraordinary powers confided to him seemed to be successful in unearthing the Nihilist conspirators and checking their activity. There was a prospect that a man of his liberal ideas and popular sympathies might eventually find out a remedy for the disorder more effective than mere repressive violence. But the murder of the Czar altered the situation. The plot was laid this time so that the Emperor could hardly escape and his assassin must surely be captured. Four conspirators were posted along the street through which the Czar was driving home from a review. Each had ready to cast a small bomb of certain and terrible explosive power. Confederates in the throng gave the signal. The second petard proved fatal. The particulars of the plot and the disclosures of the trial of the conspirators are recounted in the article RUSSIA.

ANGLICAN CHURCHES. The clerical list of the Church of England for 1880 contains twenty-six thousand names, showing a gain of about six thousand clergymen since 1859. More than six thousand clergymen are not in pastoral work.

According to the report of the *Ecclesiastical Commissioners* for England, four thousand seven hundred benefices were augmented and endowed by them between 1840 and 1880. The increase in the incomes of benefices, from the augmentations and endowments made by the commissioners or through their instrumentality, amounted on October 31, 1880, to about £756,500 per annum, representing the income from a capital sum of about £23,000,000.

The eighty-second annual meeting of the *Church Missionary Society* was held in London, May 3d, the Earl of Chichester presiding. The total receipts for the year had been £207,508, of which £189,685 were applicable to the general expenditure, the rest having come in special contributions. Besides the European missionaries, 110 native clergy and 1,720 lay teachers were employed in the missions, and 1,000 schools were attached to them. The report stated that between three and four thousand well-instructed adult converts were baptized each year through the society's labors. The missions in India absorbed one half the mis-

sionaries of the society, and nearly half of its foreign expenditure. The native churches in West Africa were gaining strength and taking upon themselves more and more the responsibilities of pastoral and missionary work. The spiritual and philanthropic work of the Freretown mission, in East Africa, had been carried on with unceasing energy. Reports were also made of the mission at Uganda, of the missions at Jerusalem, Jaffa, Gaza, Nablus, and the Hauran, in Palestine, of stations in Persia, and the other older and extensive missions of the society.

The one hundred and eightieth annual meeting of the *Society for the Propagation of the Gospel in Foreign Parts* was held May 12th, the Archbishop of Canterbury presiding. The income of the society during 1880 had been £138,288, against £131,674 in 1879. Five hundred and eighty-six ministers had been employed during the year: 157 in Asia, 121 in Africa, 54 in Australia and the Pacific, 253 in America and the West Indies, and one in Europe. There were also in connection with the society 1,242 catechists and lay teachers, mostly natives in heathen countries, and about 250 students in colleges abroad, who were in training for the work of the ministry in the lands of their birth.

The *Convocation of Canterbury* met for the dispatch of business, February 8th. The archbishop presented to the Upper House the subject of the addresses which had been sent to him for and against greater liberty in ritual. A resolution was passed in the Upper House requesting the archbishop to take steps with a view to obtaining from the crown a letter of business committing to convocation the work of providing for a fuller representation of the parochial clergy in the Lower House; the Lower House, however, declined to concur in this action. A resolution was passed in the Upper House approving of the scope of the bill which had been introduced into the House of Commons by Mr. E. Stanhope, to give effect to the recommendations of the Royal Commission on the sale and exchange of benefices. A report having been presented from the Lower House on the recommendations of a committee which had been appointed "on the relations of church and state," suggesting that greater authority should be given to convocation, the Upper House requested the archbishop to move for a royal commission to consider the subjects of clerical discipline and of courts of first instance and of appeal in ecclesiastical causes. An *articulus cleri* was adopted by the Lower House and sent up to the Upper House, asking that body, in view of the uncertainties that were thought to surround some recent interpretations of ecclesiastical law, and of the peculiar character of the parishes and the congregations placed in similar religious circumstances, to discountenance as much as possible legal proceedings in such matters. In making this request, the resolution said:

The Lower House feels that this forbearance must be conditioned by limitations.

The Upper House adopted a resolution declaring that—

Litigation in matters of ritual is to be deprecated and deplored, and if possible to be avoided. This House also declares that authority to settle differences in such matters is inherent in the episcopal office, as witnessed by ancient practice, and as referred to in the preface of the Book of Common Prayer; and while this House entertains the hope that the clergy, as in duty bound, will, in conjunction with the laity, support the legitimate authority, it also expresses its confidence that this authority will be exercised by the bishops of this province in their respective dioceses, with the earnest endeavor to compose such differences without litigation, and at the same time to maintain order, decency, purity of doctrine, and edification in Divine worship.

The convocation met again May 17th. The committee which had been appointed in 1870 for the revision of the authorized version of the Holy Scriptures reported that the revision of the New Testament had been completed, and presented the volume containing the same. The Bishop of Gloucester and Bristol spoke upon the character and extent of the labors of the committee, after which thanks were recorded to those members of the body who were not appointed by convocation. A resolution was adopted in the Upper House for the appointment of a joint committee of both Houses, to inquire into the remedies provided by law for neglect of duty by the clergy. The special attention of the parliamentary committee was asked by the Lower House for the Charity Trusts Bill. A resolution was adopted as an *articulus cleri* deprecating any further relaxation of the oath of allegiance required from persons seeking admission into Parliament. The Bishop of Llandaff stated that a committee had been appointed by the Welsh bishops and clergy to consider the expediency of undertaking a revised version of the New Testament in the Welsh language.

The convocation met again July 19th. The alleged neglect of baptism, and a proposition for the constitution of a Board of Missions, were discussed in the Upper House, and projects for giving religious instruction to seamen, and for securing the simultaneous bringing forward of church questions in church conferences and synods, in the Lower House. The Bishops of Lincoln, Exeter, and Truro were requested to consider what measures could with propriety be taken to secure the release of the Rev. S. F. Green, who was in prison for contumacy in resisting an order of the court, commanding him to desist from certain practices in ritual which had been declared unlawful.

The *Convocation of York* met April 26th and 27th. A motion was offered by the Bishop of Manchester to the effect that, in view of the doubtfulness attaching to the interpretation of the rubric relating to ornaments of the church and of ministers, as it now stands, and of the frequent litigation that has ensued, the rubric should be expunged, to establish a clear and

distinct rule in the matter, conformable to the usage which has prevailed in the Church for the last two hundred years. The resolution was unanimously adopted in the Upper House after some discussion, but was lost in the Lower House. A resolution was passed for the appointment of a committee to consider, with a committee of the Convocation of Canterbury, the constitutional relations between the ecclesiastical and civil authorities, and the best methods whereby common action may be taken by them in matters affecting the Church.

The Archbishop of Canterbury moved in the House of Lords, March 7th, the resolution which had been approved by the Convocation of Canterbury, for the appointment of a royal commission to inquire into the constitution and working of the ecclesiastical courts as created or modified under the Reformation Statutes of the 24th and 25th of King Henry VIII, and any subsequent acts, and the resolution was adopted without a division.

The Archbishop of Canterbury, with the advice and consent of the bishops of both provinces, published a letter in September in answer to a memorial which had been presented to the convocation in May, concerning what further steps could be taken toward grappling with infidelity and indifference to religion, and particularly suggesting the extension, with some modifications, of the plan for employing lay agents in directly spiritual work which had already been partially introduced in a few dioceses. After reviewing what had been accomplished so far by the employment of lay agents, the archbishop recommended that in every diocese laymen should offer themselves to the parochial clergy for the distinct work of readers; that the clergy should widely make known their desire to receive the co-operation of such laymen; and that when suitable men had come forward and been approved, they should receive a formal commission from the bishop, solemnized by an appropriate religious service. Such lay readers, the archbishop advised, should occupy a definite office, distinct alike from that of the ordinary lay helpers, and from that of women engaged in similar work.

The annual conference and annual meeting of the *Society for the Liberation of Religion from State Patronage and Control* were held May 11th. Mr. H. R. Ellington presided. The executive committee, in its report, congratulated the friends of the society on the revival of public interest in domestic questions, which would be certain to prove advantageous to the cause of disestablishment. Three quarters of a million copies of publications had been circulated, and about three hundred and fifty meetings had been held, during the year. Some advantage had been and would be taken of the interest shown by the farmers in the question of tithes. The passage of the Burials Act and its successful working were referred to in congratulatory terms. Resolutions were adopted

in respect to the death of Mr. Miall, the founder and chief promoter of the society, and a resolution was passed to the effect that—

While the Council will gladly support measures which will put an end to the traffic in church livings in the Church of England, it feels bound to oppose proposals which provide for the perpetuation of the traffic under whatever conditions, believing that the corrupt and illegal practices disclosed before the Royal Commissioners will not cease until the right to appoint to benefices ceases to be treated as property capable of being sold or bequeathed. And the Council expresses great surprise that the present Lord Chancellor should have brought in the Augmentation of Benefices Act Amendment Bill, which aims at increasing the value of crown livings for the express purpose of making them salable, and of thereby converting public into private patronage.

At a private conference of persons interested in the work of the *Church Defense Association* held March 28th, the Archbishop of Canterbury presiding, a resolution was passed declaring—

That in view of the strenuous and persistent efforts now being made to prejudice the public mind against the national Church, it is indispensable that a corresponding effort be made on the part of all who are attached to her, without distinction of religious or political party, to take such steps as may be needful for putting distinctly before the country the truth as regards the work, history, and position of the Church of England.

Efforts to add to the funds of the association were also resolved upon, in pursuance of which the Archbishop of Canterbury shortly afterward addressed a letter to the clergy directing their attention to the objects and operations of the Liberation Society, and the necessity of giving increased support to measures for counteracting them.

The twenty-first annual *Church Congress* was held at Newcastle-on-Tyne, beginning October 4th. The Bishop of Durham presided. The question of ritual was discussed under the topic of "The Limits within which Variations of Ritual may be permitted," by the Dean of Durham, Archdeacon Bardsley, Earl Nelson, the Dean of Chester, the Rev. Berdmore Compton, and the Rev. P. G. Mcdd. The question of "the Ecclesiastical Courts; the Principles on which they should be constituted, and the Methods by which their Decisions can be made more effectual," was considered by the Hon. and Rev. W. H. Fremantle, Dr. H. Cowie (Chancellor of the diocese), the Hon. C. L. Wood, Sir W. Worsley, and others. Other subjects which engaged the attention of the Congress were: "The Relation of the Church of England to Churches in Communion with her in (a) Scotland, (b) Ireland, (c) America and the Colonies"; "The Duty of the Church in Respect to the Prevalence of Secularism and Spiritualism"; "The Organization and Development of Lay Work in Connection with the Church, that of Men and that of Women"; "The Connection between Church and State, what we gain by it and what we lose by it"; "The Adaptation of the Parochial System and of Public Worship to the Require-

ments of Towns and Rural Districts"; "The Responsibility of the Church as regards the Opium-Trade with China"; "The Relation of the Church to the Social Movements of the Age, with Special Reference to Trades-Unions and Co-operation, and to the Local Administration of the License Laws"; "The Principles of the English Reformation as bearing on Questions of the Present Day"; "The Temperance Work of the Church, especially in Relation to its Parochial Organization"; "The Proper Attitude of the Church toward the Question of Sunday Observance"; "The Claims of the Revised Version of the New Testament to General Acceptance"; "Modes in which Religious Life and Thought may be influenced by Architecture, Painting, Sculpture, and Music"; and questions relating to the diocese of Durham, and the Elementary Education Act.

A judgment on the appeal of Mr. Mackonochie, a clergyman under censure for ritualism, against a decision of the Court of Arches, depriving him of his office, was given in the House of Lords, April 6th. The substantial question in the case, which had been argued a few weeks before, was whether Lord Penzance had power, as Dean of Arches, to pronounce a sentence suspending Mr. Mackonochie, *ab officio et beneficio*, for disobedience to a previous monition. The sentence of the Court of Arches had been upheld by the Court of Appeal, and their lordships now affirmed the decision of that court, and dismissed the appeal, with costs.

The fourth meeting of the General Synod of the *Irish Episcopal Church* was held in April. The Representative Body reported a summary of its work during the past ten years. The Body had now in its hands a capital of £7,500,000, of which £3,000,000 would be left after all claims and annuities were fully discharged, for the future re-endowment of the Church. Of this amount about £1,500,000 had been derived directly from the composition of annuities, and about £2,000,000 from voluntary contributions made to church funds during the last eleven years. About £130,000 a year was provided by way of parochial endowment, which, with parochial assessments amounting to £136,000, would provide about £266,000 for clerical sustentation. About £12,901 per annum would be secured for episcopal sustentation, and £25,000 would be set apart as the nucleus of a fund to provide for aged ministers. Glebe-houses would be provided for 935 out of 1,140 parishes, at a cost of £543,000. A resolution was adopted looking to the revival of the bishopric of Clogher, which has been for a long time amalgamated with the primacy of Armagh.

The British Government having determined to discontinue the ecclesiastical subsidies which had hitherto been paid out of the colonial revenues to the Church of England in Ceylon, requested the Bishop of Colombo to take steps to have a trust body elected for the Church of

England, to which the property and interests held by the Church might be transferred, and to have provision made for the future maintenance of the churches which had hitherto enjoyed the governmental endowments. The bishop called a representative assembly, to consist of all the presbyters of the diocese and two laymen for each presbyter, elected by the congregations, to meet on the 5th of July. On the meeting of the synod, differences arose respecting the apportionment of delegates, the representatives of the Church Missionary Society claiming that it should have been made according to the number of members in the churches, and complaining that, according to the actual allotment, their churches with six thousand members had only thirty-four delegates, while the other churches in the island, with only seven thousand members, were allowed seventy delegates. A motion was made to assert the incompetency of the Assembly to deal with the questions before it, as it was not a fully representative body. This being ruled out of order, the representatives of the churches of the Church Missionary Society withdrew in a body. Four trustees were chosen to take care, under the control of a Central Board of Finance, of all the property to be transferred by the crown; and provision was made for the election of a bishop in case a vacancy in the office should occur before the Constitution of the Church is settled. A committee to consist of clergymen of all the shades of theological thought, and one layman to be selected by each clergyman, was agreed to by both sides, to which should be referred the question of the organization of the synod.

ANGLICAN RITUALISTIC CONTROVERSY. The controversy concerning the ritual, and with it the collateral question of the jurisdiction of civil courts over ecclesiastical affairs, engaged attention in the Church of England above all other subjects. These questions, or points connected with them, were the subjects of numerous memorials to the bishops, archbishops, convocation, and officers of the Government, of many addresses and letters by bishops, of public meetings, and of important discussions in the convocations.

The Archbishop of Canterbury having invited those of the clergy who felt dissatisfied or alarmed at the present circumstances of the Church to state what they desired in the way of remedy, the Dean of St. Paul's and about three thousand clergymen and others addressed to him a memorial, as follows:

First of all, and especially, we would respectfully express our desire for a distinctly avowed policy of toleration and forbearance on the part of our ecclesiastical superiors in dealing with questions of ritual. Such a policy appears to us to be demanded alike by justice and by the best interests of religion. For justice would seem to require that unless a rigid observance of the rubrical law of the Church, or of recent interpretations of it, be equally exacted from all the parties within her pale, it should no longer be exacted from one party alone, and under circumstances which often increase the difficulty of complying with the

demand. And, having regard to the uncertainties which have been widely thought to surround some recent interpretations of ecclesiastical laws, as well as to the equitable claims of congregations placed in the most dissimilar religious circumstances, we can not but think that the recognized toleration of even wide diversities of ceremonial is alone consistent with the interests of true religion, and with the well-being of the English Church at the present time. The immediate need of our Church is, in our opinion, a tolerant recognition of divergent ritual practice; but we feel bound to submit to your Grace that our present troubles are likely to recur unless the courts by which ecclesiastical causes are decided in the first instance, and on appeal, can be so constructed as to secure the conscientious obedience of clergymen who believe the constitution of the Church of Christ to be of divine appointment, and who protest against the state's encroachment upon rights assured to the Church of England by solemn acts of Parliament. We do not presume to enter into details upon a subject confessedly surrounded with great difficulties, but content ourselves with expressing an earnest hope that it may receive the attention of your Grace and of the bishops of the Church of England.

The archbishop replied to the memorial by republishing a letter which he had previously addressed to Canon Wilkinson, in which he said :

It is a peculiarity of the present troubles that the clergymen who have fallen under the penalties of the law, in a way we all much regret, have come under the authority of the Provincial Courts of Canterbury and York, as the result of their having positively refused to conform to the admonition of their bishops; and, indeed, so far as I know, no case of prosecution for ritual has (at least for many years past) been allowed to proceed in the case of any clergyman who was willing to comply with such admonition. It certainly may fairly be taken to show that there must be some exceptional difficulty in present arrangements when clergymen of otherwise unimpeachable character think it their duty to run the risk of having their usefulness in their parishes rudely interrupted by the authority of the law rather than yield to those set over them in the Lord that degree of willing obedience which seems to most men to be enjoined alike by the traditions of their Church and the written words of the prayer-book (in the preface, "Concerning the service of the Church"), as well as by their promise of canonical obedience. I am quite sure I may undertake for my brethren of the Episcopate that we are ready very carefully to consider at the present juncture the grounds which appear to have led to so strange a result.

The archbishop alluded to a petition embodying the views of the memorialists, which had been presented to convocation in 1877, referred to a committee, and reported upon by the same in 1879, and promised to call the attention of convocation to the report and the subject as soon as the forms of that body would allow. A memorial signed by several dignitaries of the Church, among whom were Bishops Perry and Ryan, and the Deans of Exeter, Carlisle, Ripon, Chester, Gloucester, Peterborough, and Canterbury, was after ward presented to the archbishop, opposing the memorial of the Dean of St. Paul's and others. The signers of this address said :

We have no desire to narrow the comprehensiveness of the national Church, or to abridge that reasonable liberty which has always been conceded to churchmen in matters non-essential. We are, however, firmly convinced that neither in public prayer nor in admin-

istration of the sacraments ought there to be granted any toleration of the use of vestments and symbols avowedly introduced as exponents of doctrines which we believe to be unscriptural, or which had been declared to be not in accordance with the plain intention of the articles and formularies of the Church of England. We therefore respectfully but firmly entreat your Grace to give no countenance to any attempt to procure toleration for ritual practices, which for more than three hundred years, and until a very recent date, were almost unknown to the Church of England, and which, when submitted to the highest courts, have been declared to be contrary to the laws of the Church of the realm.

The archbishop, presenting the matter of these memorials before the Convocation of Canterbury, at its meeting February 8th, remarked that there seemed to be a certain indefiniteness about those addresses which asked for a greater amount of liberty in the matter of ritual, and it seemed to have been overlooked that, while there was an innocent liberty, there was a liberty which degenerated into license. He had no reason, however, to believe that those who had asked this had any desire for the use in the Church of England of any form of the Roman Catholic communion which might be identified with the profession of Roman Catholic customs. The bishops in their dioceses, under whose jurisdiction these matters came, would not, he supposed, be disposed to interfere with lawful ornamental ritual not contrary to the doctrines and principles of the Church of England; and he also supposed that the law was now so interpreted that great discretion was shown to be left to their lordships as to whether or not prosecutions or suits against clergy in ritual matters should proceed; so that now the bishops could refuse to sanction a mere vexatious attempt to interfere with a worship which approved itself to the parishioners, and was not contrary to law. He did not think that any more than this should be claimed, and it could not be expected that there would be any legislation in the direction of legalizing those things which the Reformation had abolished. The convocation suggested a reference of the subject to a royal commission, and advised that authority be given to the bishops to settle difficulties that might arise, and that they exercise such authority discreetly and kindly.

A memorial signed by nearly twenty-four thousand laymen was presented to the Archbishop of Canterbury, April 2d, entering the solemn and emphatic protest of the memorialists against the toleration, within the Church of England, of any doctrines or practices favoring the restoration of the Roman Catholic mass or any colorable imitation thereof, any re-introduction of the confessional, or any assumption of sacerdotal pretensions on the part of the clergy in the ministration of the Word and sacraments.

The public attention was kept fixed upon the ritualistic controversy by the proceedings in the courts in cases of ritual, by the fact of the imprisonment of clergymen who had been adjudged guilty of contumacy in violating the

law of ritual and in disregarding the inhibitions of the courts, by the protests of the friends of the imprisoned clergymen against their imprisonment, by agitations for their release, and by appeals to the public, the bishops, and the civil officers, in their behalf. The Rev. T. P. Dale, of St. Vedast's, London, and the Rev. W. R. Enraght, of Holy Trinity, Bordesley, had been imprisoned in 1880 for disregarding monitions which had been served upon them by the Court of Arches, ordering them to relinquish certain practices which had been declared illegal by the Privy Council. They both refused to submit to the decree of the court, declaring that they could not do so without violation of conscience. Mr. Dale took an appeal, and was released pending the hearing of the appeal, promising as a condition of his freedom that he would not conduct services in his church, nor even attend the church on Sunday. A release was offered to Mr. Enraght on the same conditions, but he refused to accept it, on the ground that to do so would involve his obedience to the inhibition of Lord Penzance, a condition under which he would not rest for a longer or a shorter period, for it was the very ground of the contention. The Bishop of Worcester was requested in January to take some steps to induce Mr. Enraght to amend his conduct or resign his appointment as an alternative to the bishop's taking a decided course to uphold the authority of the Ecclesiastical Court. The bishop replied that he could see no reason to hope for such an end to the troubles as his correspondent desired. The vicar had publicly declared his rejection of all direction or control or advice from the bishop, and the latter was not aware of any power vested in a bishop by which he could uphold the authority of the Ecclesiastical Court. Mr. Enraght was released from jail on account of the detection of an error in the manner in which the writ against him had been dealt with in the temporal court. Another order for his imprisonment was subsequently asked for, but he having taken an appeal to the House of Lords, judgment on the application was postponed. The appeal of Mr. Dale was dismissed; but that clergyman having accepted an incumbency outside of London, no further proceedings were had against him.

The case of the Rev. S. F. Green, of Miles Platting, Manchester, attracted more interest than any other, and was the incident to which the agitations of the year most directly related. Ritualistic practices were already observed in his church when he took charge of it, and he introduced others, with the approval of his patron and a majority of the congregation. A prosecution was instituted against him at the instance of the Church Association; he was tried in the Court of Arches, inhibited, and assessed in costs. He refusing to pay the costs or obey the inhibition, a bailiff was lodged in his house. Afterward, on the 9th of March, a writ *de contumace* was issued against him, and

he was imprisoned in Lancaster Castle. Application for a writ of *habeas corpus* with a view to his discharge was refused by the Court of Queen's Bench, April 6th. An appeal was taken to the House of Lords and was dismissed, while the judgment of the Court of Arches was sustained.

Mr. Green's case was taken up by the English Church Union, which represented that the penalties to which he was subjected were inflicted upon him because he obeyed his conscience. It was said on behalf of the courts and the Church authorities that he could be released at any time upon his simply promising to obey the writ of inhibition and to desist from unlawful practices. The case was brought directly before the Convocation of Canterbury at its session in July, when, an *articulus cleri* having been adopted by the Lower House, asking the bishops to consider what measures could be taken with propriety to secure the release of Mr. Green, the archbishop said that Mr. Green was in prison for refusing to obey the law, and he did not see how such a case could injure the Church.

Mr. Green's counsel, Mr. Phillimore, published a statement in August respecting his client's position, representing that the court for contempt of which he was punished was one that had been set up by Parliament only, without the approval of the clergy in convocation, and in the absence of any body through which the laity could make themselves heard—a wholly secular, in no way spiritual authority, an authority of a kind which he could not conscientiously allow to control him in the exercise of a purely spiritual function. To comply with the terms named as the conditions on which he could be released, would be to give up his office and cease from ministering, at the command of this secular authority—a thing he could no more do than the ancient martyrs could abjure their religion to avoid death. The Archbishop of York wrote to Mr. Green in August, suggesting to him as a way in which he might obtain his release and perhaps save future deplorable embarrassment without making or causing any sacrifice of principles on either side, that he might write to his bishop and express his readiness to abide by his superior's advice in the matters about which the suit had arisen; adding that—

It might be that the advice given would be such that your undertaking to act upon it would give the court an opportunity of relieving you from your present position, and that a clergyman could never reproach himself for having done that which his very ordination vows made a duty.

Mr. Green replied that to act as the archbishop suggested would be to adopt precisely the course which he had rejected, he believed on good grounds, two years before, and the reasons now were as ten to one why he should not do so. To surrender in the way his Grace suggested—

Would be simply to surrender the Prayer-Book.

This, I conceive, no person whatever is entitled to demand of me. Besides, I have always understood that no bishop can make an order contrary to what is contained in that book. . . . Were I, your Grace, to surrender, or even seem to surrender, the great principles at stake, I should be for ever troubled with the curse of a guilty conscience.

The archbishop, publishing the result of this correspondence, expressed regret at the want of success of his attempt to secure Mr. Green's release, but did not think that the attempt had been wholly in vain, for it had proved to him, he said,

That the cell from which we should be glad to lead him (Mr. Green) forth is locked on the inside. Mr. Green will not accept the ruling of the archbishop's court, nor the opinion of the assembled bishops of the Anglican communion throughout the world, nor the resolutions of convocation, nor the determination of his own bishop, nor the invitation of the archbishop of the province. So long as this attitude is preserved, I do not see any further means that can be adopted to effect his much-desired release.

A systematic agitation was organized by the English Church Union, to be promoted by public meetings held under the direction of the district and branch unions, and the circulation of petitions for Mr. Green's unconditional release.

A general meeting under the direction of the English Church Union, appointed to be held in connection with the Church Congress, was held at Newcastle-on-Tyne, October 5th, Mr. O. L. Wood, president of the union, presiding. Addresses were made defining and defending the position of the union and of the friends of Mr. Green; and a letter was read from the imprisoned clergyman, in which he said:

If any one asked me why I was here, I should reply, "For the kingdom of Jesus Christ." It is the honor of the Church for which we have been content to strive, and, by God's help, hope to continue to strive as long as life shall last. The awful insult offered to the Church by the Public Worship Regulation Act is such as will not be endured by the humblest sect in the land. That a Parliament, not even professing to be Christian, should set up a court and prescribe rules for the worship and discipline of the Church of God, is going, to my mind, beyond the endurable.

Resolutions were adopted thanking Mr. Green for refusing to acknowledge the authority of the Privy Council and the courts subject to its jurisdiction in matters touching faith and worship; denying—while the duty of submission to the canonical orders of the bishop was recognized—the canonical authority of episcopal directions avowedly controlled by and based upon the decisions of the judicial committee as overriding the inherent discretion of the episcopate, and declaring that no change in the ecclesiastical courts could be acquiesced in which did not restore the final determination of spiritual matters to the bishops and synods.

A bill, called the Ecclesiastical Courts Regulation Bill, was introduced in the House of Lords, with especial reference to the case of Mr. Green. It proposed the amendment of the act of 1813 and of "Thorogood's act" of 1840,

providing for the release of a prisoner incarcerated under a writ *de contumace* at the expiration of six months, with the consent of the other parties to the suit, by omitting the proviso requiring the consent of the other parties. The Archbishop of Canterbury supported this bill on its second reading in August, but said there would be a difficulty in applying it satisfactorily, because it would be hard to keep a gentleman like Mr. Green from getting into prison again after he was discharged. The Lord Chancellor, remarking that Mr. Green was charged with no fewer than eleven acts of disobedience, said that in fact that gentleman would appear to be of the opinion that no obedience was due from him in matters of ceremonial to any decisions of the ecclesiastical courts. Under the bill now before their lordships, the person proceeded against might be imprisoned for six months over and over again until he ceased to be contumacious. That would require amendment.

A committee of ritualists, selected on account of the attention they had paid to the subject, held a series of conferences on the Prayer-Book and its rubrics, and for the discussion of ritual conformity during 1880 and 1881, and published its report in September, 1881. The promoters of this step admitted that it had become apparent that the ritualistic movement, in the absence of any system of rules, had resulted in the introduction of a great diversity of practice, and that some of the clergymen, in the excess of their zeal, had adopted usages which could not be justified by any reference to the Prayer-Book; and it was believed that if the whole subject were revised in a scholarly manner, and if what could be supported by appeal to the Prayer-Book were exactly defined, a standard of extreme ritual might be fixed, under which uniformity of practice would be promoted, the irritation and friction felt in the Church would be diminished, a fair trial of the Prayer-Book, as the ritualists understood it, would be had on its own merits, and the advance of liturgical revision would be sped. The report of the committee embodies the results of its inquiries into the true meaning of the rubrics, deals with cases where a conflict of rubrics exists, and decides in some instances that certain practices which have been insisted upon are not sustained with sufficient clearness, and ought to be abandoned or modified.

The English Church Union returned in its reports for 1880, 19,410 members, showing an increase during a year of 1,684 members; six new district unions and 264 new branches had been organized. The income of the union had been \$24,970. The report said, referring to the results of the prosecutions of clergymen for alleged illegal practices, "The apparent want of success which has attended the defensive efforts to maintain the civil rights of the persecuted clergy should not be regarded with feelings of despondency."

ANTHROPOLOGY. The discovery of stone implements in gravel-beds in the bluffs of the Delaware River, near Trenton, New Jersey, raised an interesting question as to the antiquity of man in America, since these gravel deposits were believed to have been formed by glacial action. The discovery of a few human bones in Pliocene deposits on the Pacific coast was the only evidence of the extreme antiquity of the human race upon this continent before the finding of these relics in the Trenton gravels, to which attention was first called by Dr. C. C. Abbott. The genuineness of those Pliocene remains is, however, anything but well established. The inter-glacial palæoliths of the Delaware Valley are rude celts of argillite. They differ distinctly from the implements left by the Indians here and in other parts of the country; yet nearer the surface, and occasionally upon the surface, in the same region they are found among flint weapons of the Indian type. Morgan and other American archæologists have concluded that the Indians reached the Atlantic coast from the interior, and that their original seats were near the Pacific. It must be inferred that they encountered and expelled another race, who had dwelt there since the formation of these gravel deposits. There is historical evidence of a race of different ethnological characteristics from the red-men inhabiting this part of the Atlantic seacoast in the sagas of the Icelandic colonists of Greenland, relating to their visits to Vinland in the eleventh century. The Skrellings, found by the Northmen in New England, have been identified by most certain indications in their descriptions with the Esquimaux race, and were called by the same name in the chronicles. The Northmen first met the Esquimaux low down on the Atlantic coast. Three centuries later they appeared in large numbers in Greenland, and the severe conflicts which took place between the colonists and these invaders were probably the reason why the Greenland settlements were finally abandoned. The migration of the Esquimaux to the northward, evidenced by these events, was doubtless caused by the pressure of the Indians behind them, who in more recent times have encroached upon the Esquimaux in British America.

Weapons of a ruder type than the flint, quartz, and jasper arrow and spear heads, of many different patterns, attributed to the Indians, have been found near the surface, not only in the Delaware Valley, but in New England and elsewhere in the Eastern States. They are always large, rudely-fashioned celts of nearly uniform pattern, much weather-worn, and made of argillite, thus corresponding in all particulars with the implements of the Trenton gravel-beds. These palæolithic weapons, even in the absence of historical evidence, could be attributed with good reason to the Esquimaux, as being the only race living in the earlier stone age found in an accessible region. They are

quite similar to implements still made by the Esquimaux.

There was less difficulty in connecting the Delaware flints with the Esquimaux race than in accepting them as evidence of glacial or pre-glacial man, though found buried in what was supposed on good evidence to be glacial drift. The special study of this formation made by Henry Carvill Lewis has led to conclusions which remove this difficulty. Mr. Lewis says, that the implement-bearing gravel is the most recent formation except recent alluvium, and much later than the Philadelphia brick-clay and red gravels which were deposited at the melting of the great glacier. It extends up the valley of the Delaware to the Water-Gap, and is of fluvial origin, marking the former bed of the river. It bears marks of ice-action, which must be ascribed to a second (more recent) glacier, whose flood cut a channel through the deposits of the first glacial period. The date of this smaller glacier corresponded approximately to the Reindeer period of Europe. The implements found in this gravel, which is the most recent of nine gravel and clay deposits in the Delaware Valley, are unquestionably of the same age as the formation, indicating the existence of man at the time when the floods of the river covered this gravel, which is far above the present river-bed. This period Mr. Lewis proposes to call the Esquimaux period.

The recent measurements of African skulls by M. Hamy show that the races of that continent are not as universally dolichocephalous as has been supposed. He distinguishes between two distinct types of cranial formation in the negro races, and between forms within these ranging from the sub-brachycephalic through the mesocephalic and the sub-dolichocephalic to the true dolichocephalic. The dwarf race north of the equator, described by Schweinfurth and Miani (see AKKAS), has been studied by M. Hamy, who does not find their skulls less arched than those of the rest of mankind. Their stature is greater than that of the Bushmen, and is about the same average as the Andaman-Islanders. Their horizontal cephalic index approaches the true brachycephalous ratio. The Noubas, Fourahs, Gallas, and Niam-Niams, and the Haoussas, who dwell west of Lake Tchad, and are separated from the above peoples by a population craniologically distinct, he classes together in a single race.

Fossil evidence of the semi-human transitional stage in the development of the human species may be claimed to be afforded by a human jaw-bone found in the Schipka Cave in Moravia, with bones of the mammoth, and rude palæoliths. It is a fragment of the lower jaw, containing the incisors, an eye-tooth, and two premolars, with the last three back teeth just emerging from the bone. It is therefore a child's skull, in the stage of development belonging to the eighth year. Yet the size of the jaw and the teeth is that of an adult. The

lower part of the jaw recedes without forming a chin, and the hinder surface of the symphysis has a very oblique slope. These characteristics, approaching the type of the anthropoid apes, are exhibited in a much more marked manner than in any existing savage race, or in the fossils of men before discovered which show them, such as the jaw of Nanotte.

A fortified camp has been discovered by the Abbé Ambrosio Sans in the Macstrazgo plateau in Spain, which bears every indication of having been constructed by a prehistoric people of the polished-stone age. It is situated in a group of hills. On one side the position is protected by a natural escarpment. Within the curved outer wall, which was built of stones without mortar, is a smaller wall, still intact, and heaps of stones, the ruins of dwellings. The habitations were oval, about 20 feet long by 6½ feet in breadth, and were arranged in groups and in solitary positions, according to a definite plan. At the foot of the wall were found the remains of many animals, some of which belonged to extinct species. Outside of the inclosure were picked up polished celts of reddish-veined white quartz, lance-heads of blackish diorite, and other implements of the Neolithic age.

An ancient galley, discovered at Sandefjord, in Norway, throws light on the naval architecture of the Norse mariners a thousand years ago. It was the sepulchre of a viking, whose bones, with those of a little dog and some implements, were found inside, and the bones of horses and dogs sacrificed at the funeral round about; but the tomb had been plundered. The vessel was about 78 feet long, 17 feet in beam, and 5 feet 9 inches deep, and would probably draw less than four feet of water. The curves of the bent timbers seemed to be the natural growth of the trees. There were twenty ribs. The side-boards, of selected and well-seasoned oak, overlapped each other, and were fastened by iron rivets clinched on both sides. No evidences of the use of a saw were seen. The frame-timbers were fastened together with root withes. Bow and stern had the same shape. The rudder was on the starboard side, a foot or two from the stern. There was no deck. There were holes for 32 oars. These were 20 feet long. The finish and workmanship were careful and elaborate, and the plan of the hull was anything but primitive and rude, the lines being admirable for speed and for seaworthiness. The ship was covered by a burial-mound of blue clay, this material accounting for its excellent preservation.

APPLETON, JOHN ADAMS, was born in Boston, Massachusetts, January 9, 1817, and died at his residence, Clifton, Staten Island, July 13, 1881, in the sixty-fifth year of his age. Mr. Appleton was one of the firm of "D. Appleton & Company," a house well known for its steady progress and uniform success as publishers and importers of books. Mr. John A. Appleton, wherever he was known,

was highly respected and esteemed for his integrity and uprightness in all the walks of life. His time and attention were mainly devoted to the business upon which he entered as a young man, with his father and brothers; and in the prosecution of that business, upon sound and manly principles, he met with gratifying success. He acquired a large fortune, which he wisely used, not only for the benefit of his immediate family and friends, but also for the good of the community in which he lived, and especially for the cause of the church to which he was devotedly attached. About seven years ago, he was severely injured by being thrown from his carriage, and he never fully recovered from the shock thus given to his system. His last illness was aggravated by a complication of disorders, and he sank rapidly under the attack, passing away in the early morning of Wednesday, July 13th.

There were several points in Mr. Appleton's character which deserve to be noted. He was, first of all, a devout, consistent *Christian*—one who was neither ashamed nor afraid to acknowledge his faith and trust in his Saviour, and one who strove to remember always that he was a steward of God, placed in charge of large means and opportunities for promoting the spread of the Gospel and the happiness of his fellow-men. And he continued steadfast in this faith, and, when the summons came, he laid down the burden of life with firm, unwavering confidence in the mercy of our Heavenly Father in and through Christ Jesus our Lord. He was for many years senior warden of St. John's Church, Clifton, and was one of its largest benefactors. It may indeed be called his monument. A mural tablet has been erected in the church of his affections, commemorating his quiet life of faith and service as a Christian. It was done by the members of the church, his friends, and the *employés* in his business.

In admirable keeping with this inner life of faith, Mr. Appleton always proved himself to be a *gentleman* of the truest type. He was uniformly courteous and considerate toward others, never wounding the feelings of any one, however obscure or lowly his lot, and always ready with a pleasant word and kindly act. Though of a rather nervous temperament, and disliking everything of the nature of parade or show, he was fond of congenial society, and took delight in dispensing cordial and unostentatious hospitality at his beautiful residence in Staten Island. He was a lover of home and home pleasures, and, as he had been especially favored and happy in his marriage, he made his home the central point of quiet and peaceful enjoyment.

As a *business man*, Mr. Appleton was deservedly esteemed to be an honor to the name. He took his full share in upholding the high reputation which the house of D. Appleton & Co. has always sustained for integrity and fairness in their vast business transactions. He was

jealous for the good name of the house, and desirous, by every effort on his part, to extend its honorable usefulness. He was endeared to all with whom he was brought into close business relations, as touching evidence of which may be adduced the spontaneous gathering of the employés of the house, the day after his death, and the resolutions unanimously adopted at the meeting. Truly, in all the varied responsibilities of life, the passage of Holy Scripture selected as the text of an eloquent discourse preached at his funeral aptly describes Mr. Appleton's career: "The path of the just is as the shining light that shineth more and more unto the perfect day."

ARBITRATION. A decision of the Louisiana Court of Appeals embodies a totally different doctrine from that which has guided English courts, and American courts after them, for over two hundred years, relative to the obligation of merchants to submit to and abide by arbitration after agreement to do so. A contract for the sale of mules contained a stipulation that differences arising between the parties should be referred to arbitrators, one to be chosen by each party, and the two, on failing to agree, to fix upon an umpire. On the failure of the seller to deliver, the buyer brought suit in court. The selling party objected that the plaintiff had not offered to arbitrate, as the contract required. The suing party argued that a stipulation to arbitrate is revocable any time before award is made, and can not debar access to the civil courts. The court, acknowledging the weight of authority to conflict with the view taken, delivered the opinion that stipulations of this character, not being contrary to either law or to public policy, should not be considered less binding than other lawful contracts. Arbitrators are authorized by modern laws to take testimony under oath, and have accordingly the facilities for investigating simpler questions. When parties, knowing the full effect and circumstances of the agreement, have deliberately agreed to settle disputes by friendly reference, they should be left to the tribunal of their own election. The powers of arbitrators and the finality of the award have been considerably enhanced in New York and other States. Yet the liberty possessed by either party of withdrawing before the conclusion of the deliberations, discourages merchants from resorting to this mode of adjusting disputes in minor controversies, notwithstanding its preferableness to legal trial. In exchanges, boards of trade, and similar associations there usually resides efficient power to enforce a rule compelling members to submit their differences to the arbitrament of a committee, and the custom, thus made binding, is eminently satisfactory in its workings.

ARCHÆOLOGY. Important discoveries of antiques illustrating the civilizations of Egypt, ancient Chaldea, and Greece, have been exhumed and deposited in the British Museum, the Boulak Museum of the Khedive, and in the

Royal Museum at Berlin. The Egyptian discovery was the fruit of the efforts of Maspero, the new director of the Boulak Museum, and of his assistant, Brugsch, both renowned Egyptologists. It includes records which clear up a doubtful period of Pharaonic chronology. The discoveries in Mesopotamia were made by an agent of the British Museum, who has been engaged for years in this exploration, and who has now located cities more ancient than Babylon, and brought to light remains of the primeval Assyrian civilization. The Greek remains recovered embrace examples of classic art in its highest prime, and also an interesting work of a later age illustrating the aberrations of Greek genius in the decadence of taste. The excavation of these objects from the ruins of Olympia and Pergamon was conducted by commissioners of the German Government, which had appropriated a large subsidy for this purpose.

In Egypt an extraordinary treasure of sepulchral relics was brought to light in the summer of 1881, through the efforts of Professor Maspero. For many years curious antiquities have occasionally appeared in the markets, of a sort which led to the suspicion that the Arab traders had discovered a royal tomb, which they were secretly rifling. Upon deciphering a photographic copy of a ritual purchased by a traveler at Thebes, and discovering it to be the funeral papyrus of Pinotem I, Professor Maspero's suspicions were confirmed. Having been appointed the successor to Mariette Pasha as conservator of the Khedivial collections, he had the opportunity of inaugurating his official connection with an important discovery. Proceeding to Thebes, he arrested an Arab dealer in relics, one of three brothers who alone were in possession of the secret. This man, after many weeks of obstinate reticence, disclosed the situation of the treasure. The objects were then taken out by Emil Brugsch, and transported to Cairo. The place was not a tomb, but a cave which had been used as a hiding-place, to which the contents of royal sepulchres had been taken for safety. The removal took place, it is supposed, either at the time of the tomb robberies of the twentieth dynasty, or of the sacking of Thebes by the Assyrians. The mummies and grave-treasures were piled together in great confusion, and some of the identifications which were made on the strength of funereal inscriptions afterward appeared doubtful, as there were evidences that the place had already been ransacked.

There were taken out altogether some six thousand objects, including twenty-nine mummies of kings, queens, princes, and high-priests, five papyri, one of which is the funeral papyrus of Queen Makera, of the twentieth dynasty, and two plaques of the kind which Professor Maspero has before described from specimens which must have come from the same place. The mummy-cases, which were all contained in a chamber twenty-three feet by thirteen, had

been opened by Arabs, and into some the wrong mummy had been returned, as the names on the bandages did not correspond to those upon the cases. The mummies of people of the eighteenth and nineteenth dynasties appear to have been removed to this place of safety from their graves in the Valley of the Tombs during the reign of the first priest-king, Her-Hor. And afterward, perhaps on account of its secrecy, the vault was used as a burial-place for succeeding princes.

The depredations committed among these coffins have been considerable, and much of the difficulty in identifying the bodies is owing to the abstractions and displacements. The funeral papyrus of Queen Not-em-maut was purchased several years ago by the Prince of Wales, who deposited it in the British Museum. The funeral papyrus of Neb-seni, one of the dignitaries whose coffins were found, has also been for some time in the British Museum. Many statuettes, inscribed tablets, scarabæi, mummies, etc., have been sold to travelers of late years, which were undoubtedly taken from this place by the Arabs, who have known the secret of the chamber for probably twenty-two years.

Of the twenty-nine mummies recovered, seven are those of kings, nine of queens and princesses, and five of personages of distinction. The hiding-place was situated behind an angle of a cliff a little way from Deir-el-Bahari, near Thebes, southwest of the village. The entrance to the chamber in which they were concealed was by a perpendicular shaft, 12 metres deep, whose mouth was 60 metres above the plain. From the bottom of the pit a gallery, 74 metres in length, conducted to the chamber, whose dimensions were 7 metres by 4. A hint of the causes which led to the deposit of the bodies in this secret place is probably given in hieratic inscriptions on the mummy-cases of Leti I and Rameses XII, which stated that their remains had been placed for safety in the tomb of Queen Ansera. The mummy of this queen was found in the vault, though not in her own mummy case, but that of Rai, the nurse of Queen Ahmes-Nofertari.

Among the mummies were identified those of a Raskenen, one of the last kings of the seventeenth dynasty; of King Ahmes I, the founder of the eighteenth dynasty, and of Ahmes-Nofertari, his queen; Queen Arhotep and Princess Sat Ammon, his daughters, and Prince Sa Ammon, his son; of Amenhotep I, the second king of this dynasty; the mummy-cases of Thothmes I and Thothmes II, succeeding monarchs; the mummy-case, and perhaps the mummy, of Thothmes III, or the Great; mummies of Queens Hont-ta-me-hou, An, Set-ka, and Princess Mes-sont-ta-me-hou, all of the eighteenth dynasty; the mummy of Rameses I, the founder of the nineteenth dynasty; of King Seti I, his successor; the supposed mummy of Rameses II, or the Great, the third king of this dynasty, and the Pharaoh of the

Jewish captivity, but which Professor Maspero afterward concluded to be that of Rameses XII, of the twentieth dynasty; of Queen Not-em-maut, wife of Her-Hor, the first priest-king; of the high-priest Pinotem; of Queen Ramaka and her infant daughter Mout-em-hat, of the twenty-first dynasty; of King Pinotem II, the third of this dynasty, and of Queen Hon-ta-taoui, his daughter, Queen Ast-em-jeb and Princess Nessi-kon-sou, other daughters, Prince Jep-ta-a-ouf-anch, high-priest of Ammon Ra, his son, and the high-priest Mas-sa-ha-ta, another son or near relative.

The assemblage of mummies of different periods in this place was owing, according to the conjectures of Maspero, originally to the tomb-roberies of the reign of Rameses IX. The tomb of Amenhotep I was one of those which the robbers attempted to break into. It was probably in the midst of the necropolis at Koorneh. Several mummies were missing probably at the time of the removal. The tomb of Queen Mashont-ti-moo-hoo had been pillaged, and apparently those of Thothmes III, Rameses I, Seti I, and others. Contemporary mummies of the family of the twentieth dynasty were deposited in the same place for safety on account of the unsettled state of the country, owing to insurrections and the establishment of the rival dynasty at Tanis. This twenty-first dynasty could not have succeeded Her-Hor, but reigned contemporaneously with the priest-kings whose names are preserved in this cavern. These descendants of Her-Hor were as follows: High-Priest Piankhi; High-Priest Pinotem I; Pinotem II; his sons, King Menkheperra and High-Priest Mahasirti; and King Pinotem, whose wife, Makeri, was daughter of the contemporary King of Tanis. The rival dynasties were both supplanted after the death of Makeri by Sheshouk, the head of a Semitic family in Lower Egypt, who founded the Bubastite dynasty.

Assyriologists have for some time expected that in the ruined cities of Babylonia more ancient versions of the Assyrian text than the cuneiform inscriptions already recovered would yet be brought to light. In 1880 Hormuzd Rassam found a fragment of a tablet relating to the Deluge in the ruins of one of the temple libraries of Babylon. Through the seasons of 1880 and 1881 the same explorer has industriously examined the sites of the Chaldean cities of Babylon, Borsippa, Sippara, and Cutha, and has unearthed a large number of religious texts and records.

Since the large discovery of inscribed tablets made by Arabs in 1874, there have been innumerable relics and inscriptions exhumed in Babylon. The same spot has been explored by Rassam. It was the center of commercial life in ancient Babylon, being the court of a family named Beni Egibi, who seem to have been financial agents of the government. The tax-receipts found here reveal the fact that the taxes for the maintenance of the irrigation

canals and the highways were raised by duties on the land, the date and corn crops, and on cattle. There were large quantities of temple lands held in mortmain, like the mosque property in the Turkish Empire. From the palaces of Babylon Rassam has recovered records which cover the period from the reign of Nabonidus to the capture of the city by Cyrus.

Babylon was built almost entirely of brick. Chambers and corridors of the Palace of the Kings, with decorations of plaster and painted bricks, were found. Extensive hydraulic works, consisting of wells and conduits connected with the river, seem to indicate the locality of the hanging gardens. One of the kings, according to a discovered document, had sixty gardens or paradises made for him near the city. The ruins of the traditional site of the Tower of Babel are probably the seven-story tower of the Temple of Nebo.

Rassam has identified and explored the sites of two cities of higher antiquity than Babylon. These are Sippara, the city of the Sun-god, which was, according to Berosus, more ancient than Ur, having been founded before the flood, and Outha, one of the great temple-cities of Babylonia. The modern name of the site of Sippara is Abbu Hubba. The mounds cover an area of over two miles in circumference. The buildings were placed with their angles to the cardinal points of the compass. The southwest wall of an immense building was first uncovered. It was fifteen hundred feet long, and broken at regular intervals by projecting buttresses, which were ornamented by grooved panels. The edifice consisted of many long, narrow rooms, with exceedingly thick walls, arranged around a central court. This building was the Temple of the Sun-god. In a large gallery were the remains of the sacrificial altar, nearly thirty feet square; and in a connecting chamber were the records of the temple. One of the records is a votive tablet commemorating the victory of the Babylonian king Nabupallidina over the Sutu tribe of Elamites, and dating from about the year 852 B. C. It contains a figure in relief of the god and of the king and priests performing worship. It was the cult of the solar disk and rays, a form of which was introduced into Egypt in the eighteenth dynasty. A list of the six solar festivals is inscribed, two of them corresponding to the spring and autumn equinoxes. Sheep, oxen, rains, and fruits of the earth are mentioned as the sacrificial offerings, as in the Bible. This most ancient of the cities of Mesopotamia, and a neighboring place, whose ruins yielded records of minor importance, are in all probability identical with the cities of Sepharvaim mentioned in 2 Kings, xvii, 24-31, in connection with Outha, whose site was also identified and partially explored by Rassam. The British Museum, which receives the objects recovered by Rassam, already contains over three thousand of these tablets of the earlier period, including the large collection

secured from the Arabs by the late George Smith.

The excavations at Olympia, which have been prosecuted since 1875 with means furnished by the German Government, have revealed the whole plan of this most interesting city, which remained for many centuries the center of Hellenic civilization and the scene of the national festivals. The walled inclosure called the Sacred Grove, in which were the Temple of Zeus and the other shrines and sanctuaries and the official buildings connected with the Olympic games, was about four thousand feet long, and extended back from the river to the foot of the mountain about two thousand feet. The Temple of Zeus was a simpler, more massive and more imposing edifice than the Parthenon, built in a purer Doric style. The group of twenty-one colossal figures by Paionios, representing the battle between Oinomaos and Pelops, with Zeus as arbiter in the middle, which adorned the eastern pediment, have all been recovered in various states of preservation. Statues of the river-gods Alpheios and Kladeos flanked the pediment. The western pediment contained a group by Alkmenes representing a contest at the wedding of Peirithoös arrested by the intervention of the young Apollo, showing drunken Centaurs carrying off the women and Hellenes coming to the rescue, with weeping female slaves on the ground. This composition consists likewise of twenty-one figures, of thirteen of which the heads remain. At both ends of the temple are sculptures in high relief representing the labors of Herakles. They are pronounced by Curtius to belong to the same school of sculpture as the pediments. The pediments can be intelligibly reconstructed, and surpass any pediments before known. Curtius assigns the sculptures of the temple to the school of Kalamis, which immediately preceded the highest development of Attic art in the age of Phidias. In the representation of Apollo the conventional traditions were adhered to, while in the forms of the men and Centaurs complete freedom was exercised. The Heraion, which comes next in size to the Temple of Zeus, dates from an earlier period. It illustrates the growth of a Greek temple, which was originally a temporary wooden structure for the reception of votive offerings, but was gradually built up by the replacement of one group after another of the wooden pillars by stone columns. The ground-plan of another temple surrounded by pillars has also been discovered. It is the Metroön, or sanctuary of the mother of the gods. The treasures have been exposed to view in the northern part of the Altis, or sacred inclosure. They resemble temples, and stand in a row. The two largest, the thesauri of the Syracusans and of the Megareans, have been identified. The latter contains sculptures representing the war of the giants, of an age preceding the Æginetæ. One of the most interesting monuments of the

classic period is the colossal figure of Nike, by Paionios. The round temple built by Philip of Macedon after the battle of Chæronea stands in a fair state of preservation to the west of the Heraion. Structures of the Roman period are rotundas, water-works, etc., erected by Antoninus Pius and Herodes Atticus. The Pelopion, or precinct for the worship of the hero Pelops, was marked by no structure except an entrance-hall at one end. The altar of Zeus, an elliptical ring of rough stones, occupied the very center of the Altis. In the soil around the altar quantities of votive offerings in bronze and terra-cotta were found. The Prytaneion, containing the altar of Hestia and the banqueting-hall in which the Olympic victors were feasted, stood at the northwest corner of the Altis. Between the buildings the open spaces were filled with statues, the votive gifts of cities and individuals, and also statues of the victors in the Olympian contests. But few of these remain.

Outside of the Altis the stadiums, leading to the course of the runners, stood on the east. The starting-place and goal are still in position. All the other contests took place here, except the chariot-races in the Iliippodrome, of which no vestiges remain. An edifice consisting of a quadrangular court, approached by two colonnades, dates from about the same period as the Temple of Zeus. It is supposed to have been the meeting-place of the Olympic Council. A series of fine buildings stood between the Kladeos and the Altis on the west. A circular building contained an altar with inscriptions to "the hero," referring, undoubtedly, to Ianos, and afterward Klytias, founders of the priestly families of diviners which first gave to Olympia its importance. A group of dwellings near by were probably the homes of the priests, and the building whose site was taken for the Byzantine church must have been the assembly-hall of the priestly functionaries. To the north were the Palæstra or practice-court for the wrestlers, and the halls where the rhetorical declamations were delivered. East of the Byzantine church was the court, surrounded with columns, which is called the Grand Gymnasium. This was probably the largest and most splendid building in Olympia.

There have been more than four hundred inscriptions found. Many of them have reference to the visitors at the games, and afford much information regarding the different games.

The German explorers have also exhumed important remains of the Acropolis at Pergamon, a city of great splendor in post-Alexandrian times. The sculptured ornaments of the great altar, mentioned by ancient writers, have been recovered in a good state of preservation. The principal frieze represents the battle of the gods and giants. This work dates from about 200 B. C., the period of the inroads of the Gallic barbarians. The figures are of heroic size, and executed in a free and bold style. The gods are dignified and graceful in attitude and pro-

portions. In picturing the giants the artist gave free play to an exuberant fancy. Some of them are fine types of manly strength and beauty; others fantastic mixtures of human and monstrous forms; some with legs prolonged into serpents; many with one or two pairs of wings; one with a lion's head and mane; one with the horns and ears of a Triton, and one with the shoulders and hump of a buffalo. Zeus is represented engaged with many foes at once—his serpent seizing the heads of two of the hideous serpent-legs, and his ægis held aloft in his extended right hand. Athene with the gorgonion on her breast is dragging a winged youthful giant by the hair. Hecate is a singular conception, having three heads and trunks and six arms. Apollo and Dionysos are forms of great beauty. A lovely female figure, engaged in hurling a vase encircled with serpents at a giant, has puzzled all archæologists. Cybele, riding upon her lion, is armed with a bow. Of the frieze, ninety-four slabs, about three fifths of the whole, have been excavated and sent to Berlin, and with them thirty-four slabs of the smaller frieze, representing scenes from the legend of Telephus; and numerous inscriptions, statues, and other relics.

ARGENTINE REPUBLIC (REPÚBLICA ARGENTINA). "Our relations with foreign powers will be zealously maintained and fostered by my Government, care being taken to augment and strengthen the bonds of union between this republic and the most advanced nations. It will be my special endeavor to preserve harmony with our neighbors, while strictly abstaining from interference in their internal concerns. *And as for those with whom, in relation to boundaries, we have difficulties still pending, I shall seek to solve these in a manner worthy of all concerned*, without yielding one iota where I understand the dignity, rights, or integrity of the republic to be affected." These words, quoted from President Roca's inaugural speech to the Argentine Congress, were spoken on October 12, 1880. Just one year later were exchanged the following notes between the United States Minister at Buenos Ayres and the Argentine Minister of Foreign Affairs:

UNITED STATES LEGATION, *October 22d*, 11.30 P. M.

MY DEAR MINISTER: Allow me to offer you my most cordial and sincere congratulations on the final approbation, by the representatives of both countries, of the treaty which is the crowning and most glorious work of your life. It is said that republics do not know the meaning of the word gratitude. It may be so; but henceforward the two nations can never forget or cease to feel grateful for what you have done for them in one year of patient work and careful thought. Be assured that my Government and the people of the United States will speedily indorse this well-merited recognition of the honor due to you for the glorious peace and prosperity that must inevitably result from your great achievement. I shall take the earliest opportunity of calling on you in person to present my respects and renew my congratulations.

Your very sincere friend, THOMAS O. OSBORN.

Buenos Ayres, *October 22d*.

MY DEAR MINISTER: A thousand thanks for the very kind note you have sent me. I prize it extremely,

and will always keep it as a proof of your friendship. The cordial feelings you express for myself, and the kind view you take of the part I have had in arranging the boundary treaty with Chili, are highly flattering to me. If the treaty of July 23d assure peace and reknit the bonds that have bound both nations together since they achieved their independence, as I firmly believe it will, very much of such a happy consummation for the civilization and progress of this part of America will be due to you. We have both contributed something to the work you so justly call good—I by carrying out the instruction of the President, and you by so worthily interpreting the policy of the Government of the United States. I am already rewarded by the approval of my Government, my countrymen, and public opinion in general. As for you, my highly esteemed friend, it is a source of extreme pleasure to me that your honored name is linked with the international deed of July which restores peace between two peoples who are alike neighbors and brothers. Your most sincere friend,

BERNARDO DE IRIGOYEN.

Here follows the translation of the text of the treaty of limits between the two countries:

In the name of Almighty God. The Governments of the Argentine Republic and of the Republic of Chili, being desirous of effecting a friendly and honorable settlement of the dispute between their countries, and in pursuance of the treaty of April, 1856, have decided to make a treaty of boundaries; and to that end have appointed the following plenipotentiaries, namely, by his Excellency the President of the Argentine Republic, Dr. Bernardo de Irigoyen, Minister of Foreign Affairs; and by his Excellency the President of Chili, Don Francisco de B. Echeverría, Consul-General in the Argentine Republic; who, having duly presented their credentials, and found the powers respectively conferred upon them sufficient, have agreed as follows:

ARTICLE I. The limits between Chili and the Argentine Republic are from north to south, as far as the fifty-second degree of south latitude, the Cordillera of the Andes, the dividing line being that extending over the loftiest summits of the said Cordillera and separating the water-sheds of either side. All questions arising as to the limits in valleys, or where the peculiar features of the Cordillera render the determination of the dividing line of the water-sheds difficult, shall be submitted to two arbitrators, a third to be appointed should such two fail to agree; and the decision of the arbitrators, when drawn up in the form of a public instrument and duly signed by them, shall be accepted as final by both Governments. The present treaty shall go into effect upon the day on which it is signed, and shall thenceforth be regarded as binding and valid, and waiving any further formalities or negotiations; and a copy thereof shall be given to each of the two Governments.

ART. II. In the southern part of the continent and north of the Straits, the boundary between the two countries shall be a line extending from Point Dungeness along the land to Mount Dinero; thence westward over the highest points of the mountain-chain of that region to Mount Aymoud; thence to the point of intersection of the 70th meridian and the 52d parallel of south latitude; and thence westward along that parallel to the dividing line of the water-sheds of the Andes. The regions lying north of said lines shall belong to the Argentine Republic; and those south of said lines to Chili, save as stipulated in Article III, concerning Tierra del Fuego and the adjacent islands.

ART. III. In Tierra del Fuego a line shall be drawn from Cape Espiritu Santo, in latitude 52° 40', and, coinciding with the meridian of longitude west from Greenwich, 68° 34', extended south to Beagle Channel. Tierra del Fuego being thus divided, the western portion shall be Chilean, and the eastern Argentine. Concerning the islands, the following shall belong to the Argentine Republic: those of Los Es-

tados and the islands in proximity thereto, and, in the Atlantic, those lying east of Tierra del Fuego and of the eastern shores of Patagonia; and to Chili shall belong the islands lying south of Beagle Channel, and all those west of Tierra del Fuego to Cape Horn.

ART. IV. The arbitrators mentioned in Article I shall in like manner fix the limits referred to in Articles II and III.

ART. V. The Straits of Magellan shall be neutral for ever,* and the navigation thereof free to all nations; and, for the better securing said freedom and neutrality, no fortification or military defense shall be constructed there.

ART. VI. The Chilean and Argentine Governments shall exercise full sovereignty for ever over the regions to them respectively appertaining under this treaty; and should any question unhappily arise between the two countries, whether in virtue of this treaty or from any other cause, such question shall be submitted to the arbitration of a friendly power; but the limits defined in this treaty can in no event be disturbed.

ART. VII. The ratifications of this treaty shall be exchanged within sixty days, or sooner if possible, and the exchange be effected either in the city of Buenos Ayres or the city of Santiago.

In witness whereof the plenipotentiaries of the Argentine Republic and of the Republic of Chili have affixed their hands and seals to this present treaty, in duplicate, in the city of Buenos Ayres, on the twenty-third day of October, in the year of our Lord one thousand eight hundred and eighty-one.

(Signed) BERNARDO DE IRIGOYEN,

FRANCISCO DE B. ECHEVERRÍA.

For statistics relating to area, territorial division, population, etc., reference may be made to the "Annual Cyclopædia" for 1872, 1877, and 1878. The population of the republic, which was set down at 2,250,000 in 1878, is now estimated at not less than 2,400,000, and consequently presents a rate of increase hitherto unparalleled elsewhere in South America.

In Dr. Coni's demographic bulletin, under date of July 31, 1881, the population of the capital, Buenos Ayres, was estimated at 278,603.

The number of immigrants in 1870 was 39,667; in 1871, 20,928; in 1872, 37,037; in 1873, 76,332; in 1874, 68,277; in 1875, 42,066; in 1876, 30,965; in 1877, 28,798; in 1878, 35,876; in 1879, 50,205; in 1880, 41,615.

The following table exhibits the nationality and number of the immigrants who landed at Buenos Ayres in 1879 and 1880:

NATIONALITIES.	1879.	1880.
Italians.....	22,774	18,416
Spaniards.....	8,422	8,112
French.....	2,149	2,175
English.....	738	598
Swiss.....	717	551
Germans.....	490	445
Austrians.....	1,760	879
Portuguese.....	28	84
Belgians.....	78	57
Danes.....	47	54
Dutch.....	7	..
Russians.....	15	8
Greeks and Turks.....	17	11
Americans.....	51	21
Various.....	364	293
Total.....	32,702	26,648

* This neutrality clause was suggested and urged by the United States minister.

The President of the Republic is Brigadier-General Don Julio A. Roca (inaugurated October 12, 1880), and the Vice-President, Don Francisco B. Madero. The Cabinet was composed of the following ministers: Interior, Dr. A. del Viso; Foreign Affairs, Dr. Bernardo de Irigoyen; Finance, Dr. Juan José Romero; * Justice, Public Worship, and Public Instruction, Dr. M. D. Pizarro; War and the Navy, Dr. B. Victorica.

The Argentine Envoy Extraordinary and Minister Plenipotentiary to the United States and Great Britain is Dr. Manuel R. García. The Argentine *chargé d'affaires* in the United States, during the absence of the Minister, is

Señor Don Julio Carrié. The Consul-General (at New York) for the American Union is Señor Don Carlos Carranza. The Governors of the several provinces, etc., were:

Buenos Ayres.....	Dr. D. Rosa.
Minister of the Interior.....	Dr. Carlos A. D'Amico } Oct.,
Minister of Finance.....	Dr. Mariano Demaria, } 1880.
Catamarca.....	M. J. Rodríguez.
Córdoba.....	M. Juárez Celman.
Corrientes.....	Dr. A. B. Gallio.
Entre-Ríos.....	Colonel J. Antelo.
Jujuy.....	Restamento.
La Rioja.....	N. Bustos.
Mendoza.....	E. Villanueva.
Salta.....	Dr. M. Oliva.
San Juan.....	A. Gil.
San Luis.....	Z. Concha.
Santa Fé.....	S. de Iriondo.
Santiago del Estero.....	J. Gallo.
Tucumán.....	J. M. Nonges.
Gran Chaco Territory.....	Colonel F. Bosch.
Patagonia.....	Colonel A. Barros.

* Resignation tendered in November, owing to disagreement with President Roca, but not accepted.

The United States Minister resident is General Thomas O. Osborn.

The Argentine army comprised, exclusive of the National Guard, 7,203 men, as follows: 3,865 foot; horse, 2,574; artillery, 764. There were 5 generals of brigade, 14 colonels-major, 26 colonels, 126 lieutenant-colonels, 131 sergeant-majors, and 568 officers of other grades.

The navy, in August, 1881, was composed of 27 vessels: 2 steam ironclads, 6 gunboats, 2 steam torpedoes, 12 steamers transformed into war-vessels, 3 transports, and 2 sail of the line, with an aggregate tonnage of 12,000, an armament of 83 guns, and manned with 2 chiefs of squadron, 5 colonels, 8 lieutenant-colonels, 6 majors, 7 captains, 26 lieutenants, 22 students, 43 midshipmen, 7 pay-masters, 26 engineers, 900 seamen, including officers, 200 infantry and artillery (National Guard), 1 torpedo section comprising 3 commandants, 8 subaltern officers, and 80 privates. Before the end of the year, however, the number of vessels was increased by the addition of a new ironclad, the *Almirante Brown*, armed with six 40-pounder breech-loading guns, of new model, on automatic carriages; eight 8-inch 11½-ton breech-loading Armstrong guns, also of new model, firing projectiles of 180 pounds weight, with 90 battering charges, and a number of smaller guns. The 8-inch guns, so mounted that two can be fired straight ahead and three on each broadside, are described as surpassing in range all the guns hitherto mounted in the British navy, and inferior to only a few in penetrative power. There is a naval school and a school for cabin-boys, and at Zárate there is an arsenal.

The national revenue and expenditure for the fiscal year 1879-'80 has been officially reported as follows:

REVENUE.	
Import duties.....	\$12,844,733
Export duties.....	2,837,863
Warehouse fees.....	832,135
Stamped paper, etc.....	512,394
Post-Office.....	347,431
Telegraphs.....	95,285
Light-houses, etc.....	84,384
Railways.....	504,642
Sundries.....	8,904,613
Total.....	\$21,463,040
EXPENDITURE.	
Ministry of the Interior.....	\$2,305,293
“ of Foreign Affairs.....	62,040
“ of Finance.....	7,512,412
“ of Justice, Public Worship, Public Instruction, etc.....	1,051,090
“ of War and the Navy.....	8,924,937
Sundries (including salaries, etc.).....	1,959,543
Total ordinary expenditure.....	\$16,545,335
To which are to be added:	
Expenditure extraordinary.....	\$425,181
Matured debts from 1877.....	606,071
Matured debts from 1873.....	7,599,991
	8,631,243
Grand total.....	\$25,476,573

The following are among the more important items of expenditure comprised in the latter table:

Salaries.....	\$1,068,720
Post-Office and telegraphs.....	589,773
Bridges and highways.....	21,982
Subsidies to provincial governments.....	52,483
Immigration.....	157,718
Diplomatic service.....	62,040
Legislature.....	502,898
Public Instruction.....	732,477
Justice.....	165,256
Public Worship.....	153,857
Army.....	3,874,518
Navy.....	550,349
Agriculture.....	8,820
Railways.....	252,939
National Observatory.....	24,464
Public Works.....	64,552
Railway guarantees.....	223,605
Rio Negro Expedition.....	396,654
Interest and sinking fund of consolidated national debt.....	7,512,412

The following tables exhibit the estimated revenue and expenditure for 1881:

REVENUE.	
Import duties.....	\$18,500,000
Export duties.....	3,000,000
Warehouse fees.....	850,000
Stamped paper, etc.....	650,000
Post-Office and telegraphs.....	452,000
Light-houses, etc.....	85,000
Railways.....	700,000
Interest.....	164,777
Wharfage.....	14,000
Forests.....	30,000
Sundries.....	1,000,000
Total.....	\$19,898,777
EXPENDITURE.	
Ministry of the Interior.....	\$3,262,413
“ of Foreign Affairs.....	139,920
“ of Finance.....	9,576,646
“ of Justice, Public Worship, Public Instruction, etc.....	1,375,072
“ of War and the Navy.....	5,482,450
Total.....	\$19,886,501

Almost every item of the foregoing tables is indicative of continued financial prosperity. In the first place, the relatively small deficit observed on comparing the total revenue and the total expenditure for 1879-'80, and which would in all likelihood be covered by the revenue derived from the capital, is the more striking as the Treasury was called upon in that year to meet extraordinary obligations amounting to \$8,631,243. Then the yield of the custom-house department was \$15,732,101, against \$13,150,824 for the year immediately preceding, thus showing an increase of \$2,581,277, or little less than one half of the entire national revenue of the United States of Colombia, although the population of this latter country exceeds that of the Argentine Republic by more than 500,000. And again, in the budget for 1881, the proposed appropriation for public instruction was set down at \$941,496, while the actual outlay upon that important branch of the public service was but \$732,477 in 1880, almost a quarter of a million less. In August last, the minister laid before Congress his budget for 1882, in which he estimates the customs receipts at \$18,785,000, including an additional duty of one per cent on all imports and exports already subject to duty. We subjoin the schedules of this latest budget, in which the revenue presents an estimated total of \$24,632,000, and some sources of rev-

enue are enumerated that are not separately expressed in any of the tables heretofore given, while a small surplus appears in place of a deficit:

REVENUE.	
Imports.....	\$13,850,000
Imports additional.....	650,000
Exports.....	3,960,000
Exports additional.....	505,000
Warehouse fees.....	850,000
Stamped paper.....	1,250,000
Licenses.....	600,000
Direct imports, deducting 40 per cent for education.....	720,000
Post-Office.....	500,000
Telegraphs.....	250,000
Light-houses.....	40,000
Health inspection.....	14,000
Woods and forests.....	90,000
Judicial auctions.....	40,000
Judicial deposits.....	100,000
Water-works.....	200,000
Notaries.....	12,000
Interest on Eastern Argentine Railroad shares.....	116,000
Interest on state lines.....	755,000
Guanó.....	10,000
Sundries.....	800,000
Total.....	\$24,692,000

EXPENDITURE.	
Ministry of the Interior.....	\$3,996,772
" of Foreign Affairs.....	158,250
" of Finance.....	12,074,402
" of Justice, Public Worship, and Public Instruction.....	1,952,584
" of War and the Navy.....	6,495,996
Total.....	\$24,618,034

The funded national debt of the Argentine Republic was reported in November, 1881, at \$107,982,592, and those of the provinces at \$29,689,047, constituting a total funded debt of \$137,681,639, or \$57 per capita approximately. The foreign debt comprises \$82,365,930 national, and \$2,611,320 provincial (exclusive of the Buenos Ayres debt assumed by the nation). It is proper here to transcribe the following extract from President Roca's special message to Congress, under date of September 23, 1881, on the subject of the so-called \$100,000,000 loan for the conversion of those debts. The total amount proposed to be converted is \$76,588,323, and the effect of the scheme would be to reduce the present annual service (interest and amortization) from \$8,570,432 to \$5,414,187.

TO THE CONGRESS OF THE NATION: If it was in earlier days necessary to discuss the prerogative which a nation enjoys of paying off its debts at any moment, that right is now, at least, an undisputed fact. The most advanced nations of Europe and the United States of America have exercised it amply, when compatible with the situation and public interests of the country. The question of convenience is evident, since with a lesser sum the state can meet its obligations to its creditors, and is enabled at the same time to attend to the usual public service, under a reduced system of taxation in the country, or place a larger capital to increase the wealth, comfort, and development of the nation. The opportune moment to realize these operations depends on a combination of many circumstances and complicated elements, not easily defined and specified, but which show in their results, by the improved credit of the state and the facilities for solving financial problems, that the opportunity has arrived to effect the vast operation of consolidation of the debt, in order to make it less onerous and more reliable for the sake of the creditor. I believe that this moment has come for our country, and every day

it is being more felt, and I therefore hope that the appended bill will meet with your approbation. Allow me to present to you a statement of the home and foreign debt of the nation, that you may with all accuracy appreciate the bill which I have framed on the subject. The following table shows how the public debt will stand on the 31st of December of the present year, and also the different dates when the several emissions will be extinguished, should their present service be continued:

FOREIGN DEBT.	Total.	Extinguished in—
English loan, 1824:		
Original bonds.....	£123,515	{ 1896
Deferred bonds.....		{ 1890
English loan, 1868.....	214,500	1887
English loan, 1871.....	525,134	1890
Provincial loan, 1870.....	73,279	1903
Provincial loan, 1873.....	144,558	1906
Railway loan.....	173,540	1914
Total.....	£1,254,521*	

INTERNAL DEBT.	Total.	Extinguished in—
National public funds, law of November 16, 1863.....	\$1,130,028 48
National public funds, law of October 1, 1860.....	239,999 99	1882
National public funds, law of October 21, 1876.....	34,758 00	1910
Bridges and road stock.....	130,729 00	1895
Debt to foreigners.....	81,343 00	1897
Treasury bills.....	649,703 00	1902
Treasury bills.....	130,000 00	1906
Provincial public funds.....	50,328 00	1894
Total.....	\$8,570,432 53	

The national bonds of the law of November 16, 1863, will be extinguished:

First series.....	\$5,000,000 in 1891
Second series.....	5,100,000 " 1913
Third series.....	6,143,264 " 1940

In this table are not included the emission of \$1,420,000 (law of the 5th of November, 1872), to pay the shares of the National Bank subscribed by the Government, nor the \$16,000,000 lately created by Congress to close the account of the nation with the Provincial Bank. The special object of each of these laws, and the special conditions of the issuing of the loans, besides their bearing 5 per cent interest, render it unnecessary to take the same into consideration. I also consider that they should not be included in the conversion, and therefore they do not appear in Article III of the project, neither do the deferred three per cent bonds created to pay overdue interest on the 1824 loan, nor the home debt created by the law of 1st of October, 1860. The relatively low interest of those bonds renders any explanation unnecessary in reference to them; and, as the last will be all paid off by amortization before the end of next year, I have deemed it unnecessary to include them, the more so as their amount is now comparatively insignificant. Thus, the total amount of home and foreign debts is to be converted into 76,588,323 hard dollars. If all the bondholders accept the equitable and even advantageous terms of conversion offered to them, should you pass the project, the result will be as follows: The interest and amortization on the public debt, which now cost \$8,570,432, will be reduced to \$5,414,187, and this will be further reduced by \$239,999 before the end of 1882; and, in 1890, when the deferred bonds of the 1824 loan will be paid off, the total service of the debts will be an annual saving of \$748,041

* Reduced to dollars at the rate of 4' 88 per pound sterling, 6,123,526' 48 hard dollars.

in interest and \$2,396,242 in amortization. This reduction will, I consider, compensate for the advantages offered to the bondholders, who, on the other hand, in addition to the premiums, will have the security that their bonds can not be converted for ten years, excepting so far as 1 per cent yearly amortization, established by Article 1, goes. If, however (but that is not probable), holders refuse to convert voluntarily, there is nothing for it but to pay them off in cash, at par; and, in this case, I think the new 5 per cent bonds can be negotiated at a price that will give the same results as the voluntary conversion offered to the present bondholders. The operation can be carried out in a lump, or successively, as may suit the interests of the state; and if, by some inconceivable error, the bondholders totally or partly refuse to convert voluntarily, in a very short time the increase of public and private wealth, and the elements at the disposal of the nation, will show that the country has sufficient means wherewith to amortize, in a short time, at least the most onerous of its debts. The credit of the country at home and abroad is rapidly reaching the level it has a right to. Our debts religiously paid even in the midst of the greatest difficulties, brought on by our political errors and the effect of a commercial crisis, have gained confidence for us at home and abroad, and consequently our credit is improved and increased.

JULIO A. ROCA.

JUAN JOSÉ ROMERO.

It was regarded as probable that the project would be passed, there being a majority in its favor in both Houses. Another important bill brought during the session was one for the abolition of forced inconvertible paper money, and the success of which was looked forward to as all but certain; indeed, the sanguine went so far as to predict the return to specie payments by the end of the year.

"We are in the habit," writes a British financier, "of saying the number of paper dollars to the pound has fallen 10, from 149, at which they were this time last year, to 139; but a telegram has been received this week informing us that they have very recently descended to 127, or only 5 above par, the par value of the paper dollars being 122 to the pound. We have long said that paper and gold in the Argentine country would come to a level, as they have in the United States. Paper has now arrived at that standard, saving 5 dollars on 122. The fact is most important to the railway and tramway interests of that country. It is also important to the country itself, and its creditors. It affords a further assurance, if any were wanted, of the perfect good faith of the Argentines toward their bondholders. When their 6 per cent bonds were at 30, they never failed to pay the full interest and apply the heavy sinking fund. Now, that those cloudy days have passed away, the country is at peace, prosperity in a full blaze, and money matters are easy, of course the case of the bondholders is better than ever. The old 6 per cents have reached a premium. But we can not say that the Argentines have managed their financial matters well as to raising new loans. The recent Paris loan of £3,000,000 (\$12,000,000) for railway extension was raised* at 82, and the more recent Lon-

don loan for similar purposes of £2,450,000 was placed at 91 per cent. Both these prices seem high for 6 per cent Argentine loans, especially when the old loan was at par or a premium. The last London loan, issued at 91 price, is really better than the old 6 per cent loan, which commands par or a small premium, since the heavy accumulative sinking fund of the old loan is rapidly paying those bonds off at par. The 1868 6 per cent loan has already been nearly paid off, and will be entirely extinguished by 1889. Therefore, those 6 per cents can never go to much premium. But the new 6 per cent loan, whose security is just as good, has an accumulative sinking fund of 1 per cent, which discharges the principal at par in 33½ years. Therefore, these bonds may reach a higher premium than the old, for their time of repayment at par is much more distant. The credit of the Argentines being so sound, and the prosperity of the country so great, we should have thought that 6 per cents could have been placed at par. The Buenos Ayres Great Southern Railway 6 per cent debenture stock is at 120 with the dividend just off, and the Central Argentine Railway 6 per cent debenture stock at the same price, at which the purchaser only gets 5 per cent for his money. The government security may never stand so high as the railway, but there would have been a wide difference if the government 6 per cent stock had been placed at par, the railway 6 per cents commanding 20 per cent premium."

The new departure in Argentine foreign commerce referred to in the "Annual Cyclopædia" for 1880 (p. 21), namely, an excess of exports over imports, ruled in a still higher degree in the year following the one alluded to in that volume. "Ships now leave our ports," remarks President Roca, "with what we formerly imported, and each successive year we have some new product to export. Here is one fact: 4,000 tons of flax shipped from the country between January 15th and April 15th this year."

Argentine 1868 six per cents were quoted in London at 101½ to 102½ on December 22, 1881. These securities first reached par in December, 1880.

The subjoined tables show the values, sources, and destinations, respectively, of the exports and imports for 1880:

From	IMPORTS.	Values.
Belgium.....		\$2,403,000
Brazil.....		2,332,000
Chili.....		503,000
France.....		8,025,000
Germany.....		2,289,000
Great Britain.....		12,103,000
Holland.....		844,000
Italy.....		2,534,000
Paraguay.....		806,000
Spain.....		2,394,000
United States.....		3,120,000
Uruguay.....		3,183,000
West Indies.....		131,000
Other countries.....		954,000
In transit.....		2,965,000
Total.....		\$44,066,000

Destinations.	EXPORTS.	Values.
Belgium.....		\$13,593,000
Brazil.....		1,928,000
Chili.....		1,278,000
France.....		15,588,000
Germany.....		2,460,000
Great Britain.....		5,169,000
Italy.....		2,058,000
Paraguay.....		46,000
Spain.....		1,139,000
United States.....		4,961,000
Uruguay.....		1,793,000
West Indies.....		1,479,000
Other countries.....		776,000
In transitu.....		3,925,000
Total.....		\$56,497,000

On comparing these two tables, the balance of trade in favor of the republic in 1880 is observed to have been \$12,431,000, against \$2,898,000 in 1879. To the usual list of Argentine export staples* have been added some new articles, as, for instance, ostrich-feathers, of which 72,229 kilogrammes were shipped in 1880, of the value of \$156,000.

The shipping movements at the various ports were as follows in 1880:

	Number of vessels.	Aggregate tonnage.
Entered: { Steamers.....	2,517	902,290
{ Sailing-vessels	2,147	308,167
Cleared: { Steamers.....	2,112	822,882
{ Sailing-vessels	1,022	231,946

Of railways there were ten in operation in 1881, of an aggregate length of 1,545 miles; and in course of construction three other lines, aggregating 190 miles. Of telegraph lines there were, in 1877, 4,848 miles (3,365 miles of which were the property of the state), with an aggregate of 9,887 miles of wires. The number of dispatches in 1879 was 242,259, of which 42,636 were official; the receipts having been \$165,266, and the expenditures \$169,266.

In 1879 the number of letters that passed through the post-office was 6,696,328, of which 1,494,854 were official; and that of packages of printed matter 11,152,089, of which 457,913 were to or from foreign countries.

On the occasion of the opening of Congress, May 8, 1881, President Roca, in a long but unusually interesting message, presented an elaborate sketch of the country under its various aspects—political, financial, commercial, industrial, and intellectual. Here follow a few brief extracts from that document:

MESSRS. SENATORS AND DEPUTIES: As you are aware, peace, order, and complete liberty, with every prospect of a long duration, prevail all over the republic, and our credit has reached every country and market in Europe, where they are at last beginning to believe that we have reached the years of discretion and common sense. The uncertainty in which we were living, even in times which were apparently the most tranquil, has been succeeded by a most boundless confidence in the future. Life, movement, a spirit of progress, and a love of work, have sprung up in all parts. The provinces are no longer armed in defense of their autonomy or against revolution, but are occupied in political, social, and economic reorganization, improved administration, agriculture, irrigation, roads, banks, and all kinds of improvements.

The session before you is full of work to be done. It is as if we were a people newly born, as you will

have to legislate on the attributes, means, and authority of the nation—so great was the want of a permanent capital for the republic. Now you may make laws in full liberty, knowing that they will be obeyed, and without consulting anything but common sense, justice, and expediency, or fearing that any provincial governor should enter these halls to protest against or dictate your measures.

The Executive is in perfect accord with the authorities of all the provinces, and not even the slightest hitch has occurred in the working of the liberal and complicated laws of our political system. The law ordering national intervention in Rioja resulted in a speedy and satisfactory solution, thanks to the clear terms in which the orders of Congress were expressed, and the tact and prudence of the commissioner appointed.

I feel pleasure in telling you that the republic is on the best terms with all foreign powers. We can easily keep so, as the fundamental principle of our foreign policy is a determination to defend our rights and to respect those of others.

The Executive and the whole country have witnessed with profound sorrow the horrible drama on the Pacific, the ruin of two sister republics, and the gulf dug between three nations of the same blood, who should be united for mutual advancement, instead of tearing each other to pieces. For this reason the mediation of the United States Government in October last was so joyfully hailed by public opinion. We had a right to hope that such a powerful and respected nation would be able to bring about peace between the belligerents, and only when it failed did I deem it right to make a fresh attempt at conciliation, with the aid of a South American state which, being on the best of terms with the republics of this continent, and for other reasons, I considered the best wherewith to initiate a fresh attempt at friendly interference. The Minister of Foreign Affairs will report to you the result of this negotiation. The Governments of Peru and Bolivia addressed that of this country, denouncing the bitter character of the strife, and protesting against the terms of peace proposed by Chili. In its turn the Chilean Government sent us the protocols of the conferences at Arica, explaining its line of action, and declaring that it sought no conquest. I trust that, after the recent battles, decorous and satisfactory bases of peace may be arrived at. The reclamations made by the legations of the belligerents here have been impartially attended to, with due regard to the exigencies of those at war and the rights of those who, in peace and tranquillity, remain strictly neutral.

The Colombian Government asked us to send a representative to the conference at Panama, to introduce the principle of arbitration into American international law. Our relations with Brazil are perfect. The treaties which guarantee them are strictly observed, and the efforts of some uneasy spirits fail before the circumspection and foresight of both Governments. We must definitely settle our boundaries with the empire. It is a joint work, and, once the dividing line, through mysterious and deserted forests, is traced, the science and civilization of both countries will soon break in on their solitude. In more peaceful days for Bolivia we can also settle our boundaries with her. We maintain with Uruguay the good relations natural between nations whose blood and interests are identical, and any differences that arise are promptly settled with good-will on both sides. Paraguay has broken off her commercial treaty with this country and Brazil, but this shall not alter our wishes for her prosperity.

The Holy See, and the American and European Governments, send us frequent proofs of friendship. I will lay before you this year several conventions which will consolidate our good relations with those powers.

I have the utmost confidence in the rectitude of our foreign policy. Nothing shall divert us from the principle of peace abroad and the firm assertion of our

* See "Annual Cyclopædia" for 1880, p. 21.

rights. Our native land, whole and without a stain, shall link us equally with the past and the future.

The credit and wealth of the nation are apparent in every way, now that it is felt that peace and order are firmly established. The receipts at the custom-house in the capital for the last six months exceed by 1,045,500 hard dollars those in the same period of the previous year. Our bonds have reached the highest quotations in London, while here there is no price, as nobody will sell. Ships now leave our ports with what we formerly imported, and every year we have some new production to export. Here is one fact: 4,000 tons of flax shipped at the Riachuelo between 15th January and 15th April this year. The gross revenue of the national railways was \$805,379. The Central Argentine Railway is now beginning to return what it received as guarantee. The balance in favor of government in 1880 was \$130,993. The shares are at a premium in London. The mint is finished, and might have been at work, but the Executive decided to wait to lay before you some measures to meet difficulties that have arisen since you passed the coinage act. The abolition of forced currency and a uniform circulating medium are of primary interest to the country. Forced currency and privileges are against the spirit of a free government and the Constitution, which guarantees freedom of trade and industry; they also drive away foreign capital, disturb business, and inflict enormous loss on the Treasury. Every effort that Congress and the Executive can make to free the country from this burden will be amply repaid. The day on which we get a uniform currency, and are free from inconvertible paper and privileges, there will be an immense influx of foreign money. Bad coin, like the primitive languages of America, is not a means of civilization, and, if we have progressed in spite of monetary chaos, it is solely due to the exuberant vitality of the country.

The twelve-million loan, authorized in October last, for railway extension in the interior, was successfully contracted for with Paris bankers at 82, and the works are progressing. As you will see in the Finance Minister's report, it is the first loan launched here (and perhaps in South America) direct, and with special commissions.

The National Bank, reorganized in 1876, shares the general prosperity of trade. The price of its shares shows its improved credit, and it will be of much greater service in the interior when the monetary confusion that interferes with the circulation of its notes shall have disappeared.

ARKANSAS. The biennial session of the Legislature commenced in January. The financial affairs of the State occupied considerable attention. A State Board of Finance was created, consisting of the Governor, the Treasurer, and the Auditor, and is empowered to borrow money to meet the expenses of the government by pledging the State's bonds, which shall not be hypothecated for a less amount than three fourths of their face value. The debt thus contracted is to bear no higher rate of interest than 6 per cent per annum, and is to be payable in two years. A senatorial commission was appointed to examine the Auditor's and Treasurer's books, upon the suspicion of a default in the Treasurer's accounts. That officer's honesty was not impugned, however, by the instigators of the investigation.

A law was passed, prohibiting the sale or giving away of intoxicating liquors within a radius of three miles from any church or school-house in the State.

The Legislature passed one measure which

promises to be effective, if enforced rigorously, in diminishing a class of crimes for which the State has borne an evil reputation. It is the so-called "pistol bill," which makes it a misdemeanor, punishable by a heavy fine, to sell or to keep for sale, or to furnish in whatever manner to any person, any species of sword or dagger, or any kind of pistol, excepting the regulation navy revolver. It also prohibits the carrying of deadly weapons of any sort, except the wearer be on his own premises, or on a journey, or be an officer of the law. Officers and justices of the peace are subject to like penalties for neglecting to arrest or to entertain proceedings under the act.

A law to protect the public against unqualified medical practitioners requires every person desiring to practice as a physician or surgeon to prove his or her qualifications before a county board, and to be registered in the office of the county clerk. Persons denied registry may demand an examination, as to their proficiency, by a State medical board.

The law relative to larceny was changed so as to make thefts of property under the value of ten dollars petty larceny only, the law having been excessively severe, thefts of above two dollars being punished as grand larceny.

Arkansas is still one of the most backward States in educational facilities. The public-school appropriations amount to only \$205,000 per annum, being considerably less in proportion to the school population than is spent by any other State. Congress has granted over 1,000,000 acres of land to Arkansas for school purposes. In some sections the State fund is supplemented by liberal local levies. Considering the facts that the public-school system was not established until 1868, and that in 1870 only 75 per cent of the adult population could read and write, substantial educational progress is being made. The State tax for school purposes is only two mills on the dollar. The local tax raised in the individual districts is determined by popular vote every year at an annual school-meeting. The tax usually voted in the more progressive districts is five mills. Some depend solely on the scanty allowance afforded by the State fund.

A state of violence and intimidation, in which the authority of the law was superseded, prevailed for several months in Perry County, terminating in the assassination of J. L. W. Matthews, editor of the "Fourche Valley Times." The judicial acts of County Judge Harris had been murmured at by a group of citizens, who complained that the murdered man had procured or influenced obnoxious proceedings. One day a band of armed men rode into Perryville, and frightened the judge from the bench by their menacing appearance. The Governor was appealed to, and General Newton, of the militia, visited the county, but found no outward evidences of lawlessness. There were no further disturbances until the evening in July on which Matthews was shot. Judge

Harris received at the same time a notice of warning to leave the county. Through fear, the sheriff and magistrates refrained from instituting proceedings against the suspected murderers, appealing to the Governor to restore order. Two detachments of militia were sent into the disturbed district to protect the civil officers in the discharge of their duty. The arrest and commitment of the prisoners took place under military guard. A guard of State soldiery was posted in the town for several weeks to preserve order. Similar lawless developments occurred in Polk County, though of a less serious character. Writs of the court were defied, and the sheriff threatened. Exhibitions of mob-law have not grown less frequent in Arkansas. Various cases of the infliction of vengeance on supposed criminals by bands of lynchers occurred in 1881, as in former years. Instances of the violent seizure of prisoners in legal custody, and the wreaking of popular rage upon their persons, continue to take place. These manifestations of lawlessness accompany, as usual, a high rate of crime, especially of the crimes against the person which spring from anger or revenge, or reckless bravado. The customary difficulty of procuring salutary convictions for serious assaults of this character still obtains. There are many signs, however, of a rapid reformation of the manners of the people in this respect. This tendency is clearly reflected in the expressions of the press, and in the attitude of the influential classes of citizens. The strict and judiciously framed law against the unwarranted carrying of deadly weapons, passed at the last session of the Legislature, indicates the vigor of the movement. The recent temperance legislation had for its principal motive the desire to prevent violence and crime. An active agitation, which wins a remarkable moral and numerical support, is now being carried on in favor of stringent restrictive or prohibitory enactments to suppress the liquor-traffic. This movement takes rank with the debt controversy as a leading political question. It has its root in the determination to redeem Arkansas from its reputation for savagery and anarchy; although the majority may condemn a prohibitory law, as unnecessary or impracticable.

The question of the repudiation of a part of the bonded debt of the State has rendered imminent a disruption of the Democratic party. The plan of resettlement embodied in the Fishback amendment, so called, which was rejected in the general election of 1880, is earnestly approved by a large section of the party, while the other branch includes its most decided opponents. Neither faction can sacrifice their liberty to speak and vote according to their principles in this question, while both are equally anxious to preserve the party organization in order to prevent the administration from falling into the hands of the Republicans. It was proposed, therefore, that at the Democratic Convention of 1882, a State ticket should

be nominated which should be supported by both divisions of the party unitedly, and that a resolution should be adopted, calling for a constitutional convention for the settlement of the debt question. Every member of the party should be guided by his own convictions on the debt question in the canvass for the Assembly elections, and in his action with reference to the Constitutional Convention. The Democratic State Central Committee, in a meeting in May, concluded to bring forward in the State Convention a proposition for an amendment which would not invalidate the objectionable bonds, but would yet prevent their funding or payment without the express acquiescence of the people. The purport of the proposed amendment, by which it is sought to stave off the question and avoid a final committal of the party, is expressed in the following first draft to be submitted to the party convention in the beginning of 1882:

1. Hereafter the General Assembly of this State shall be prohibited from making any settlement or adjustment of the bonded debt of this State, based on what is known as railroad-aid bonds, levee bonds, or Holford bonds, which shall be binding upon the State, until such adjustment shall have been submitted to and voted upon by the qualified electors of this State by the next succeeding general election after such act of adjustment has been passed, and the same shall have been ratified by a majority of the qualified electors voting at such election.

2. That no act of the General Assembly of this State, which may hereafter be passed, making an appropriation to pay off any part of the principal or interest of any of the bonded indebtedness of this State, based upon what is known as railroad-aid bonds, levee bonds, or Holford bonds, shall be binding on the State or paid from the Treasury until such act shall have been submitted at the next succeeding general election after such act of appropriation has been passed to the people, and the same shall have been ratified by a majority of all the qualified electors voting at such election; and they further recommend that no action on said indebtedness be taken by the General Assembly until such amendment shall have been submitted to a vote of the people.

The financial troubles of Arkansas date from its first erection into a State in 1836. A State Bank was organized, and authorized to issue \$2,000,000 of bonds, and further credit was obtained by means of a real-estate bank, whose \$1,500,000 of bonds were guaranteed by the State, and secured by the public lands. Both institutions suspended payments in the second year. This was the commencement of the State debt, the unskillful management of which has ever since impeded the progress of the State. The State debt matured in 1862. Since the restoration of self-government in 1869 the weight of public sentiment has favored the evasion of the vast liabilities which it would still tax all the resources of the State to discharge in full. The debt contracted in waging war against the Federal Government was declared void. Its repudiation was followed by a series of defaults on other obligations. The levee bonds were decided to be unconstitutional by the Supreme Court in 1878, and all the railroad-aid bonds have since been declared

by the same court to have been illegally issued. The vote on the Fishback amendment, which repudiates the bulk of the debt of Arkansas, was about 61,000 for, to 41,000 against. It was declared not carried, because it lacked 4,000 of a majority of all the votes cast. The liabilities, considered not binding by so large a proportion of the citizens of the State, consist of about \$2,000,000 of levee bonds, \$5,000,000 of railway-aid bonds, and other disputed liabilities, aggregating about \$4,000,000. There is an admitted debt amounting to some \$5,000,000, over half of which is funded. The ground on which the levee and railroad subsidy were outlawed by the courts, and on which they are disclaimed by the people, is principally that the acts authorizing their issue were not passed in the manner provided by the State Constitution. The other class of bonds which it is sought to exclude, known as the Holford bonds, were a part of the whole series issued under the funding act in 1870-'71. They are objected to on the ground of general fraud. The other funded bonds of the State are recognized as valid by all parties. The Legislature in the early part of the session of 1881 passed an act directing the Auditor and Treasurer to drop from their books the levee, railroad-aid, and Holford bonds.

The settlement of the debt question in a way which shall be understood to be final, whether by the acknowledgment of the entire debt, or the repudiation of a portion of it, would probably promote the commercial progress of Arkansas. The cessation of lawless license and the universal observance of legal methods would have a much more powerful effect in attracting capital and immigration. The recent extension of railroads is already leading to the establishment of new industries, and the enlargement of the agricultural area. Although its development has been slower than that of any other State, the natural resources of Arkansas are scarcely excelled. Nearly the entire area of the State is cultivable land of high average quality. The soil is seven to ten feet in depth, and contains potash, soda, magnesia, ferrous oxide, lime, and phosphoric acid in favorable quantities. The greater part of the 10,000,000 acres donated by Congress as "swamp-lands," need no reclamation whatever. Timber-land in this State is easily brought under cultivation, as stumps rot thoroughly in three years. The crops of the prairie States and of the Gulf States thrive equally. The yield of cotton is as large in proportion to the labor applied as in any part of America. It is a surer crop in Southern Arkansas, probably, than in any other district. Sugar-cane, tobacco, and all the cereals are cultivated with profit. The planting-season lasts from February till August, so that, if a crop does not promise well, a second one can be planted and harvested the same season.

Arkansas is one of the richest timber States in the Union, though this source of wealth has been as yet but little developed. The abundant

growth of excellent black-walnut will doubtless come into requisition as the supplies of that valuable wood fail in Indiana, Upper Canada, and other northern districts, while the demand still increases. There are seventy varieties of useful timber in Arkansas. Besides black-walnut, there are numerous other highly-prized timber-trees, which attain large proportions, and grow in abundance. There are several varieties of the oak. The cherry, the bois-d'arc, the holly, and the maple furnish choice qualities of timber. The cedar, the beech, the poplar, the cypress, the hickory, and the ash are common. The yellow pine grows to large size, and its forests take up one tenth of the area of the State. With 2,500 miles of navigable rivers, with a greater length of running water than any other inland State, the facilities for driving logs render the wealth of valuable lumber, which clothes a greater part of the State's surface, easily accessible. Walnut logs have already been shipped in large quantities to Eastern manufactories and to England. The price of this favorite wood is constantly rising. The lumber was at first floated in rafts, buoyed up by intermingled cypress logs, to New Orleans, and thence shipped on cars to the East, but is now transported directly by rail.

Arkansas is also a State of extraordinary though undeveloped mineral wealth. The coal-fields, covering 12,000 square miles, and containing more than those of Great Britain, afford anthracite and cannel as well as bituminous coal, deposited in strata of four to nine feet in thickness. The semi-anthracite quality characteristic of these beds renders the coal excellent for smelting and manufacturing purposes. The iron-ores are as rich as those of Missouri, and nearly as abundant. Specular and hematite ores both abound. The lead-ores of Arkansas are of remarkable richness, containing, not only a large percentage of lead, but a considerable proportion of silver associated with it. Veins have been found yielding 70 per cent of pure lead and 200 ounces of silver per ton; and assays of 6 per cent of silver have been known. Perhaps the largest zinc deposits on the continent are found in this State, and stores of manganese unexcelled in any part of the world. Among the other prospectively valuable mineral resources are mines of salt, antimony in abundance, gypsum in greater quantities than the other States contain together, and, in Pike County, near the Little Missouri River, a whole mountain of fine alabaster. Silver-mining operations are being started in the Mount Ida district, in Montgomery County. The ores are as rich as many which are profitably worked in districts where the business has been long established, but where the facilities are far inferior. In Pulaski County, just out of Little Rock, there are other ledges of ore which assay from 50 to 1,200 ounces a ton. Zinc is found in vast, easily accessible beds of calamine, or carbonate, which is the most easily worked of the zinc-ores, and also in the form of the

sulphuret or blende. Works established in Lawrence County for converting the calamine into metallic zinc have been abandoned, probably from want of capital. In the northern counties there are vast quantities of marble of many varieties, and of admirable texture for building and monumental purposes.

The great extension of railroad facilities, which is in prospect, will contribute largely to the material development of Arkansas. Railroad companies contemplate the building of some 2,000 miles of new railroad within the State lines. They do not expect any assistance from the State, since the constitutional limit of 850 miles of railway altogether for which the State, county, and city credit may be pledged, was reached several years ago, the aid awarded amounting to \$9,900,000 in all. The Iron Mountain Company, which has already done much to build up the State, contemplates building 900 miles of branch lines. One will reach from near the Missouri line to Vidalia, opposite Natchez. The second will run from about 30 miles south of the north line of Arkansas straight west 150 miles. Another will extend from Little Rock southeast to the Louisiana line. The fourth will extend from 85 miles southeast of Little Rock to Alexandria, Louisiana, on the Red River. The extension of the Atchison, Topeka and Santa Fé to the Mississippi will enter Arkansas at Fort Smith, and pass across the State from side to side, 200 miles. The St. Louis and San Francisco is completing the section from the north State line to Texarkana, 200 miles long, whence it will follow the course of the Red River to a point opposite Natchez, 150 miles farther. The Memphis and Charleston intends crossing the State from the east. The line being built by the Texas and St. Louis Company intersects the State diagonally from the southwest to the northeast corner, 300 miles. The same railroad company is adding a branch, 120 miles long, running from Little Rock to Shreveport. The Fort Scott, Southeastern and Memphis Railroad is building a line from Springfield, Missouri, to the Mississippi, opposite Memphis, traversing the State for 200 miles. Besides these, various shorter lines and branches have been surveyed, and some are under construction. The projected railroad of the Georgia syndicate from Atlanta to the Mississippi River, opposite Arkansas City, will furnish direct connection between Arkansas towns and the Southern sea-ports on the Atlantic, making a continuous line from Fort Smith, on the border of the Indian nation, to Atlanta, and thence to Charleston and Richmond.

The compilation of the census of Arkansas has been only partially completed at the Census Office, so as to be available for this volume. The following is the population of the State by counties:

COUNTIES.	Population.	COUNTIES.	Population.

The result of the presidential election in the State was—Hancock, Democrat, 60,775; Garfield, Republican, 42,436; Weaver, Greenback, 4,079: total vote, 107,290. Hancock's majority over Garfield, 14,260.

The vote for State officers was as follows:

FOR SECRETARY OF STATE.

Jacob Frolch, Democrat.....	86,732
C. E. Tobey, Greenback.....	27,630

FOR TREASURER.

W. E. Woodruff, Jr., Democrat.....	86,937
W. A. Watson, Greenback.....	26,443

FOR AUDITOR.

John Crawford, Democrat.....	86,937
C. E. Cunningham, Greenback.....	26,270

FOR ATTORNEY-GENERAL.

C. B. Moore, Democrat.....	87,206
G. Sibley, Greenback.....	24,370

FOR LAND COMMISSIONER.

D. W. Lear, Democrat.....	88,251
W. Riley, Greenback.....	27,116

FOR SUPERINTENDENT OF PUBLIC INSTRUCTION.

J. L. Denton, Democrat.....	90,329
-----------------------------	--------

FOR CHIEF-JUSTICE.

E. H. English, Democrat.....	87,051
J. C. Davis, Greenback.....	27,357

FOR CHANCELLOR.

D. W. Carroll, Democrat.....	88,462
------------------------------	--------

The vote for members of Congress was as follows:

District.		
I.	Dunn, Democrat.....	15,753
	Johnson, Republican.....	10,407
	Jones, Democrat.....	16,517
II.	Williams, Republican.....	4,513
	Garland, Greenback.....	3,920
	Cravens, Democrat.....	15,751
III.	Boles, Republican.....	11,552
	Gunter, Democrat.....	7,387
IV.	Murphy, Republican.....	4,125
	Peel, Independent Democrat.....	5,731

The State Legislature was divided as follows:

PARTIES.	Senate.	House.
Democrat.....	80	80
Republican.....	1	10
Greenback.....	1	8

ARMY OF THE UNITED STATES. The military divisions and their departments, with the names of the commanding generals, are as follows:

Military Division of the Missouri, Lieutenant-General Sheridan.

A. Department of Dakota, Brigadier-General Terry.

B. Department of the Platte, Brigadier-General Crook.

C. Department of the Missouri, Brigadier-General Pope.

D. Department of Texas, Brigadier-General Angur.

Military Division of the Atlantic, Major-General Hancock.

A. Department of the East, Major-General Hancock.

B. Department of the South, Colonel and Brevet Brigadier-General Hunt.

Military Division of the Pacific and Department of California, Major-General McDowell.

A. Department of the Columbia: 1. Colonel and Brevet Brigadier-General Wheaton; and, 2. Brigadier-General Miles.

B. Department of Arizona, Colonel and Brevet Brigadier-General Wilcox.

The Department of West Point is under General O. O. Howard, and the artillery-school at Fort Monroe, Virginia, is under command of Brevet Major-General Getty.

The total enlisted force of the army in October, 1881, was 23,596 men. There were 120 companies of cavalry, 60 of artillery, and 250 of infantry.

For a short time, viz., from January 31, 1881, to May 9, 1881, a Military Division "of the Gulf" was constituted by President Hayes, embracing Louisiana, Texas, Arkansas, and the Indian Territory, with Major-General Schofield in command; but, as this division was found to fulfill no useful military end, it was discontinued by President Garfield, leaving boundaries as they existed before.

While the troops have been kept very busy during the past year, no serious Indian or other war has occurred, but great progress has been made in collecting and locating Indians, hitherto hostile, on their proper reservations. Sitting Bull and his adherents, who had fled into British territory, are now held at Fort Randall, Dakota, as prisoners of war, and the Utes have been moved to a new reservation in Utah. A sudden outbreak of a part of the Apaches occurred in Arizona. In this case it was found necessary to re-enforce for a short time the usual garrisons in Arizona by a strong detachment from New Mexico under Colonel Mackenzie of the Fourth Cavalry. Some of the guilty

Apaches are held as prisoners for trial. Some have escaped into Mexico, while the greater part of the tribe remains on their reservation at San Carlos, under their proper civil agent.

The actual expenditures under the War Department for the fiscal year ending June 30, 1881, were \$42,122,201.39.

The appropriations for 1882 were \$44,889,725.42.

The estimates for 1883 are \$44,541,276.91.

The estimates presented to the Secretary for revision included—

For armament of fortifications.....	\$720,000
Fortifications and other works of defense.....	4,186,500
Improving rivers and harbors.....	29,101,300
Improving Mississippi River, by commission.....	4,823,000
Public buildings and grounds in and near Washington.....	749,000
Surveys of lakes.....	20,000

Total..... \$39,099,800

This amount was reduced, on his revision, to aggregate \$10,689,000.

The remainder of the estimates includes salaries and expenses of the departmental civil establishment and amounts for the support of the army, for armories and arsenals, and for miscellaneous objects. For these purposes the estimates for 1883 were \$33,852,276.91, being \$296,321.37 in excess of the estimates for 1882, and \$2,082,851.49 more than the appropriations for the current fiscal year. While the estimates of expenses for this class show an increase, there is in the estimates of expenses for improvements, including rivers and harbors, a decrease which overbalances the difference, and makes the estimates for 1883 \$348,448.51 less than the appropriations for 1882.

The report of the General of the Army calls attention to the public necessity of legislation authorizing the army to be recruited to a strength of thirty thousand enlisted men. There are in the army four hundred and thirty companies, which are necessarily widely scattered over the vast domain, to guard property and to prevent, as far as foresight can, complications and troubles of every variety and kind; at one time protecting the settlers against Indians, and again Indians against the settlers. When these occur, re-enforcements have to be hurried forward from great distances, and always at heavy cost for transportation of men, horses, wagons, and supplies. This cost in the aggregate is estimated more than sufficient to supply an increase of twenty per cent of *private soldiers*.

The number of deaths of soldiers was 130 from disease and 67 from wounds and injuries, being 9 per 1,000 of mean strength, the fatal results in cases treated being as 1 to 190.

The number of new official demands upon the record and pension division during the fiscal year, for information as to the cause of death in the case of deceased soldiers and the hospital record of invalids, was 55,040. The average number of such demands, during the previous ten years, had been 22,245 annually, and the number during the fiscal year termi-

nating June 30, 1880, was 39,241; the number received during the fiscal year ending June 30, 1881, being an increase of 40 per cent over the previous fiscal year, and of 147 per cent over the annual average of the previous ten years.

At the commencement of the fiscal year 6,964 cases remained unanswered, making 62,004 cases to be disposed of during the year. Search was made and replies furnished to the proper authorities in 40,596 of these cases, leaving 21,408 unanswered cases on hand on the 1st of July, 1881.

ARNIM, Count HARRY VON, ex-ambassador of Prussia at Paris, died at Nice, May 19th. He was born of an influential family of the Prussian aristocracy in Pomerania, in 1824. His uncle, who had adopted him, was Minister for Foreign Affairs. He embarked in a diplomatic career at an early age. In 1864 he first won celebrity as envoy to Rome, gaining special credit by his attitude toward the Ecumenical Council. He was summoned to Versailles in 1871 to aid in settling terms of peace with the French, and took a leading part in the negotiations which resulted in the Treaty of Frankfort. In June, 1872, he was appointed ambassador to Paris. Differences of opinion, which had long existed between him and the German Chancellor, led to his recall and assignment to Constantinople in April, 1874. The publication of his Roman dispatches caused his dismissal from the service. The polemical discussion to which he challenged Prince Bismarck was answered by his prosecution and sentence to imprisonment on the charge of having filched state documents from the archives of the German embassy at Paris. He had previously removed himself beyond the jurisdiction of the German courts. A pamphlet published anonymously, in which he sought to trace evidences of the personal spite of the Chancellor in his former prosecution, led to a new indictment, and his sentence to five years of penal servitude for leze-majesty and insults to the Chancellor and the Foreign Office. In pamphlets published in 1878 he criticised in a calm and dignified tone the aggressive policy of the German Government against the Catholic Church, arguing that Prussia should have aimed to establish a national Catholic Church in Germany. In later years he desired to return to Germany and stand his trial for high-treason, the sentence for which crime hung suspended over him; but the authorities refused to appoint a new trial.

ARTHUR, CHESTER ALAN, elected Vice-President in 1880; became President of the United States on the death of James A. Garfield, September 19, 1881. He was born in Fairfield, Franklin County, Vermont, October 5, 1830, the eldest of two sons of the Rev. Dr. William Arthur. He had four sisters older and two younger than himself. His father, a Baptist clergyman, at the age of eighteen, emigrated from Ballymena, County Antrim, Ireland. He was a graduate of Belfast University.

Devoting himself to literature, he published for several years "The Antiquarian," and was the author of a work on "Family Names" which displayed great erudition of a peculiar kind. He was pastor of the Calvary Baptist Church in Albany, New York, from 1855 to 1865; and died in Newtonville, near that city, October 27, 1875. The second son, William Arthur, distinguished himself in the Union army during the late war, and is now a paymaster in the regular army, with the rank of major. A thorough course in the best schools of Union Village and Schenectady, with a careful training in the classics by his father, enabled the President to enter Union College at the early age of fifteen. He graduated high in his class in 1848. He commenced the study of law at Fowler's law school in Ballston Spa. During his college course he supported himself in part by teaching, and after his graduation he continued in that occupation several years, meanwhile devoting himself to the study of law. In 1853 he went to New York and entered the law-office of ex-Judge E. D. Culver, was admitted to the bar the same year, and began the practice of law. In 1859 he was married to Ellen Lewis Herndon, of Fredericksburg, Virginia, a daughter of Captain William Lewis Herndon, who heroically remained at his post and went down with his ship, the *Central America*, in 1857. His widow was the recipient of a gold medal, voted by Congress, in recognition of his bravery. Mrs. Arthur died in January, 1880, leaving two children, Chester Alan, aged fifteen, and Ellen Herndon, aged eight years. Mr. Arthur distinguished himself early in his profession as the champion of the legal rights of the colored race. His first notable case was the Lemmon slave case, in which he was the attorney for the people, William M. Evarts being the leading counsel. They maintained that eight slaves, with whom Jonathan Lemmon, of Virginia, attempted to pass through New York on his way to Texas, were rendered free by the act of the master in voluntarily bringing them into free territory. Judge Paine, before whom the case was tried on a writ of *habeas corpus*, ordered the slaves released, affirming that they could not be held in servitude in New York, nor returned to bondage under the provisions of the fugitive-slave law. This decision was sustained by the Supreme Court of New York, and by the Court of Appeals, where Charles O'Connor was employed by the Attorney-General of Virginia to argue the case. In 1856 Mr. Arthur was counsel for Lizzie Jennings, a colored girl, who had been forcibly ejected from a street-car in New York city, after paying her fare. A verdict against the company was obtained, and the equal rights of colored people in public vehicles established.

Mr. Arthur early took an active interest in politics as a Henry Clay Whig, and was a delegate to the convention, at Saratoga, which founded the Republican party of New York.

H. B. Hall, Jr.

Chester A. Titton
Feb 15 1882

D Appleton & Co

He also had a taste for the administration of military affairs, and before the civil war was Judge-Advocate of the Second Brigade of the State militia. When Edwin D. Morgan became Governor of New York, at the beginning of 1860, he appointed Mr. Arthur to the position of engineer-in-chief on his staff, and he was afterward made Inspector-General, and then Quartermaster-General of the military forces of the State, an office which he held until the end of Governor Morgan's term, at the close of 1863. He conducted the duties of his office in equipping, supplying, and forwarding the immense number of troops furnished by his State, with such success that his accounts were audited and allowed at Washington without deduction, while those of some of the States were reduced by millions of dollars. It has also been said that while he had the giving of many large and profitable contracts, and the control of enormous purchases, with opportunities for making gains, which most men would have regarded as legitimate, he never profited a penny from the business under his charge, and left the office of Quartermaster-General poorer than when he took it. Presents offered to him were promptly rejected, and, if sent, returned. In 1862 there was a secret meeting of "loyal Governors," to discuss measures for providing troops, at which Mr. Arthur was present by invitation, being the only person taking part who was not the Governor of a State. Many instances are related of the notably vigorous administration of his military office.

In 1863 General Arthur returned to the practice of law, and built up a large business in collecting claims against the Government. He also drafted many important measures of legislation, and promoted their adoption both at Washington and at Albany. For a short time he was counsel of the New York Board of Tax Commissioners. Meantime he took an active part in local politics, and became known for his skill as an organizer and manager. On the 20th of November, 1871, he was appointed by President Grant Collector of Customs at the port of New York, an office to which he was reappointed in 1875. His second appointment was promptly confirmed by the Senate without a usual reference to a committee. President Hayes, after his accession to office in 1877, promulgated an order forbidding persons in the civil service of the Government from taking an active part in political management. Mr. Arthur was at that time chairman of the Republican Central Committee of New York city, and Mr. A. B. Cornell, who held the position of Naval Officer, was chairman of the State Central Committee, of the same party. Both gentlemen neglected to comply with the President's order by resigning their party positions, and were suspended from office in July, 1878. An attempt had previously been made to supersede General Arthur by removing him, and appointing his successor during

the session of the Senate, but the appointment was not confirmed. The successor appointed after his suspension in July was confirmed in office at the following session of the Senate. Two special committees investigated Mr. Arthur's administration of the Collector's office, and reported nothing on which a charge of official dereliction could be based. Both the President and the Secretary of the Treasury, in connection with his suspension, acknowledged the purity of his official acts. A petition for his retention in office, signed by all the judges of the New York courts, most of the prominent members of the bar, and nearly all the importing merchants of the city, was suppressed by Mr. Arthur himself. The only accusation made against him was that of disregarding the President's order in respect to active participation in political management. In a letter to Secretary Sherman, he produced figures showing that in the six years of his administration as Collector of New York, removals from subordinate offices amounted to only 2½ per cent of the whole number, against an average of 28 per cent under his three immediate predecessors, and that all but two appointments in one hundred to important positions, commanding a salary of \$2,000 and more, had been made by promotion from the lower grades of the service, on recommendation of the heads of bureaus. His reforms in the methods of conducting the business of the office were generally acknowledged.

On retiring from the office of Collector of the Port of New York, Mr. Arthur returned to the practice of law in that city, and continued to take an active part in politics, contributing materially to the nomination and election of Mr. Cornell to the governorship of the State. He was a zealous supporter of the claims of General Grant to the Republican nomination for the presidency in the Chicago Convention of 1880, being closely associated with Senator Conkling in the effort to secure that result, as he had previously been in the political affairs of the State of New York. When the movement to nominate General Grant was defeated, and Mr. Garfield was made the candidate, Mr. Arthur was nominated for the vice-presidency by acclamation, for the purpose of enlisting the hearty support of the Grant Republicans for the ticket, and securing, if possible, the vote of New York. He took an active part in the management of the canvass which followed, especially in his own State, acting as chairman of the Republican Central Committee. He presided in the Senate during the special session, which began on the 4th of March, with dignity and general acceptance. In the contest between the President and Senator Conkling, in regard to appointments in the State of New York, the Vice-President took no part, but, after the resignation of the New York Senators, he went to Albany and actively participated in the effort to secure their re-election. It was during this contest

that President Garfield received the shot that subsequently proved fatal, and it put an end to Mr. Arthur's electioneering efforts in behalf of Mr. Coukling. While the President lingered between life and death from July 2d to September 19th, the Vice-President refrained from all part in public affairs and the controversies of the time, only expressing on fitting occasions his own sincere share in the common grief and anxiety.

The death of President Garfield was announced to him in New York by a telegraphic dispatch from the members of the Cabinet, who expressed the wish that he would repair to Long Branch the following morning. In accordance with the advice of his friends, he took the oath of office at his own house in New York before one of the judges of the State Supreme Court, at about two o'clock in the morning of September 20th. After visiting Long Branch and accompanying the remains of the dead President to Washington, Mr. Arthur was sworn into office in a more formal manner before the Chief-Justice of the Supreme Court on the 22d, and delivered a brief address in which he expressed his sense of the grave responsibilities devolved upon him. The same day, as his first official act, he proclaimed a general day of mourning for his predecessor. A special session of the Senate was called, to begin on the 10th of October, for the purpose of choosing a presiding officer and confirming such appointments as might be submitted. The members of the Cabinet were requested to retain their places until the regular meeting of Congress in December. Only Secretary Windom, of the Treasury Department, who desired to become a candidate for the Senate from Minnesota, insisted on his resignation. Chief-Judge Folger, of the New York Court of Appeals, was chosen as his successor, after ex-Governor E. D. Morgan, of the same State, had declined the appointment, though it had been submitted to the Senate and promptly confirmed. The new President took a prominent part officially in the Yorktown celebration on the 19th of October, delivering an appropriate address.

ASTRONOMICAL PHENOMENA AND PROGRESS. *The Sun.*—The "American Journal of Science" for June, 1881, contains a discussion of the American photographs of the transit of Venus in 1874, by Professor D. P. Todd. The mean equatorial, horizontal parallax of the sun derived from these photographs is 8.883", corresponding to a distance of 92,028,000 miles.

Solar Activity.—The "Comptes Rendus," vol. xciii, No. 8, gives the result of M. Tacchini's solar observations up to August 1st. The number of spots and prominences continues to increase. At no time between January 1st and July 31st was the sun's disk found free from spots. The daily record of their numbers has indicated several well-marked epochs of special solar activity. Whether these secondary max-

ima are accidental, or whether their occurrence is in accordance with an undiscovered law, is a question to be decided by future observations. The dates of these periods are: January 17-21, March 9-20, April 2-9, April 16-25, May 5-9, May 23-31, June 12-18, June 25-July 10, and July 24-August 4. M. Tacchini observes that these epochs are frequently separated by half a solar rotation.

New Minor Planet.—On the night of May 18th, Dr. Palisa detected a new minor planet, the 220th of the group. This is the only planetoid discovered during the year. Its light at the time of discovery was extremely feeble, the apparent magnitude being 13.5.

Jupiter's Spots.—Within the past year Professor Hough, Director of the Dearborn Observatory, Chicago, Illinois, has given special study and attention to the spots of Jupiter. A discussion of all the measures of the great red spot, commenced in the autumn of 1879 and continued through 490 days, gives a mean rotation period of $9^h\ 55^m\ 35.2^s$. But individual observations seem to indicate a motion of oscillation of the spot itself; the displacement in longitude amounting to 3,200 miles. The observations of small spots during two months indicated an average drift in longitude of about three miles per hour. The rotation period derived from observations of a small white spot almost exactly on the equator was $9^h\ 50^m\ 0.56^s$. If the great red spot, therefore, be regarded as fixed, the mean drift of the equatorial parts will be 265 miles per hour in the direction of the planet's rotation. The true diameter of the equatorial white spot measured about 2,800 miles. These observations, it must be confessed, leave the true rotation period of the planet somewhat uncertain. As they indicate, however, but slight deviations from permanency in the position, form, and dimensions of the red spot, the period can differ but little from $9^h\ 55^m\ 35^s$.

Comets.—The sixth comet of 1880 was discovered December 16th, by Dr. Pechüle, of Copenhagen. Its motion is direct, and the elements of its orbit resemble those of the comets of 1807 and 1881 *b*.

The first comet of 1881 was discovered May 1st, by Dr. Lewis Swift, Director of the Warner Observatory, Rochester, New York. Its elements have no marked resemblance to those of any known comet.

On the night of May 22d, Mr. John Tebbutt, of Windsor, New South Wales, discovered a comet which proved to be one of more than ordinary interest. The same body was independently detected a few days later by Dr. B. A. Gould, at Cordoba, South America. It was observed at many places in Europe and America on the morning of June 23d, and was conspicuously visible to the naked eye from June 23d to August 1st. Its tail could be traced to a distance of 12° or 13° from the nucleus, the true length being nine or ten millions of miles. Its orbit resembles that of the comet

of 1807, and its period exceeds two thousand years.

The third comet of the year was detected on the morning of June 14th, by Dr. J. M. Schæberle, at Ann Arbor, Michigan. It was observed telescopically more than three months, one third of which time it was visible to the naked eye. The striking resemblance of its elements to those of the third comet of 1822 is seen by the following comparison:

ELEMENTS.	1822 III.	1880 III.
Perihellon passage.....	1822, July 16.	1881, Aug. 22.
Longitude of perihellon.....	219° 53' 48"	219° 13' 38"
Longitude of ascending node.....	97 51 23	97 7 29
Inclination.....	142 16 56	140 16 9
Perihellon distance.....	0.5461	0.6338
Calculator.....	Heiligenstein.	Abetti.

On the night of July 6th a great outburst of the comet was observed at Cincinnati, Ohio, by Mr. Wilson and Professor Stone. The former first noticed a peculiar glare on the side toward the tail. The appearance was that of a large jet of matter, of a red or exceedingly bright color, shooting out from the comet. The phenomenon was so striking as to suggest the incipient separation of the comet into parts.

Encke's comet was detected on August 20th, by Dr. Hartwig and Professor Winnecke, with the six-inch comet-seeker of the Strasburg Observatory. This was its twenty-ninth return since its first appearance in 1786. The positions of this body are observed and discussed with a lively interest at each successive return, as Encke's celebrated theory of a resisting medium must stand or fall by the evidence derived from its motion.

The fifth comet of 1881 was discovered on the morning of September 19th, by Professor E. E. Barnard, of Nashville, Tennessee. Its elements are somewhat like those of the comet of 1698, as is shown by the following comparison:

ELEMENTS.	1698.	1881 V.
Perihellon passage.....	1698, Oct. 18.	1881, Sept. 15.
Longitude of perihellon.....	270° 51'	271° 22'
Longitude of ascending node.....	267 44	260 43
Inclination.....	101 46	107 27
Perihellon distance.....	0.6912	0.5076
Authority.....	Halley.	S. C. Chandler.

Another comet, the sixth of the year, was discovered October 4th, by Mr. W. F. Denning, of England. Its appearance was that of a small, round nebula with a bright, central nucleus. Herr Palisa has computed the following elements:

Perihellon passage.....	1881, Sept. 12.
Longitude of perihellon.....	220° 13' 5"
Longitude of ascending node.....	72 6 17
Inclination.....	7 85 57
Perihellon distance.....	0.725

Elements have also been computed by M. Schulhof, of Paris, and Professor S. C. Chandler, of Cambridge, Massachusetts. The period, according to the former, is seven years and nine months; according to the latter, eight years and four months. The orbit makes a rather close approach to that of Jupiter, near

its descending node, so that the comet is occasionally liable to considerable disturbance.

On the evening of November 16th, Dr. Swift, of the Warner Observatory, Rochester, New York, discovered a faint comet in Cassiopeia—the second detected by him since May 1st.

The Meteors of August and November.—The number of meteors seen about the 9th and 10th of August, 1881, was less than usual—a fact partly due to the brightness of the moonlight. The shower of November 14th–15th also failed, no Leonids having been seen in certain places where looked for. According to the "National Republican" of November 15th, a meteor of great brilliance was seen at Washington, D. C., about five o'clock on the morning of the 14th. It was described as a broad band of meteoric light starting from a point a little west of north, and about 60° above the horizon. This meteor, which was visible at least ten seconds, was probably a member of the Leonid stream.

Motions of the Fixed Stars.—The monthly notices of the Royal Astronomical Society for January, 1881, contain a fourth paper by Sir George B. Airy on spectroscopic results for the motions of stars in the line of sight, observed at the Royal Observatory at Greenwich. According to this table, the following are the rates of motion of certain well-known stars: Of the two pointers in the Dipper, Dubhe, that nearer the pole-star, is approaching the sun at the rate of twenty-seven miles per second, while Merak is receding with nearly equal velocity. In the same asterism, Phekda, Migrez, Alioth, and Mizar, are all receding at the average rate of sixteen miles per second, while Benetnash is approaching the solar system with a velocity of eight miles a second. In the Square of Pegasus, Alpheratz, Algenib, and Markab, are approaching at the rates of thirty-three, forty-six, and thirty-four miles per second, respectively, while Scheat is approaching at the rate of nineteen. The distance of Castor is increasing twenty-five miles per second, and that of Pollux decreasing at the rate of twenty-six. The distances of Aldebaran and Regulus are both increasing; the former twenty miles per second, the latter twenty-six.

The Distribution of the Variable Stars.—In "The Observatory" for September, 1881, Mr. T. E. Espin gives the following results of a careful study of the distribution of the variable stars:

"1. The variable stars show a decidedly well-marked zone inclined 15° or 20° to the equator.

"2. This zone crosses the preceding side of the galactic circle north of the equator, and the following south of it.

"3. In crossing the preceding side of the galactic circle, the zone is not many degrees broad, and is very clearly marked; where it crosses the following side it is broken up into two streams.

"4. The division into two streams occurs where the galaxy is also divided into two streams.

"5. In this part the variable stars are intimately connected with the galaxy, often falling in the gaps, and constantly on the edges of the gaps, but rarely in the center of the star-sprays from the galaxy. Where the zone crosses the preceding part of the galaxy, it is marked sharply and clearly, and seems unconnected with the galaxy.

"6. It is a remarkable thing that all the temporary stars with one or two exceptions have appeared in the region where the galaxy and the variable star zone are both broken into two streams.

"7. The exceptions to the zone are chiefly found in the bright and short period variables.

"8. The addition to the chart of the stars more strongly suspected variable, and that on competent authority, strengthens the zone very much indeed, and but very slightly the number of exceptions."

The fact that nearly all variable stars of short period are found in a particular zone has also been remarked by Professor E. C. Pickering, of the Harvard College Observatory. Professor Pickering describes this zone as extending 16° on each side of a great circle whose pole is in right ascension 195° and north declination 20° . The average distance of thirty-one well-known variables of short period from this great circle is $5^\circ 30'$, while a random distribution would give an average distance of 30° .

Gold Medal of the Royal Astronomical Society.—At the annual meeting of the Royal Astronomical Society of London, in February, 1881, the gold medal of the society was awarded to Professor Axel Möller, for his researches on Faye's comet.

ATLANTA EXPOSITION. (See EXPOSITION, ATLANTA.)

ATOMIC THEORY. There have been many attempts to establish a law of numerical relations between the atomic weights of the elements. The discovery of definite ratios between the atomic weights and other quantitative attributes, the division of the elements into specific groups distinguished by well-marked properties, and the tendency to doubt their primary character and to regard them as derivative combinations of simpler bodies, give a fresh impetus to speculation in this direction.

Mendelejeff's periodic law, confirmed as it has been by the discovery of gallium and other predicted elements, and by the agreement of many established facts with his scheme of periodic functions, which more exact quantitative determinations have rendered more complete, has been elevated into the rank of an accepted theory.

The Russian chemist has correlated the elements according to a synthetic law which is the most comprehensive yet established in chemistry, co-ordinating all the physical properties and the chemical affinities of the whole list of simple bodies. Arranging the elements in the order of their atomic weights, their densities, and consequently their atomic volumes,

which depend upon the density, and their combining numbers in compounds with other elements, each follow a certain progressive order in successive groups of the elements. Similar properties recur with complete regularity, and follow the same order of progression in the successive series. The properties are modified as the atomic weights increase; but the modifications affect entire groups, and do not interrupt the gradual progression within the periods. The elements of the different periods in which the same or similar properties are repeated constitute the natural families already established by other chemists upon the ground of their identical combining numbers. The atomic weights of contiguous elements usually differ by only a few units. In cases where there is a considerable hiatus there is also found a gap in one or more of the natural orders, which should be represented here by members of intermediate atomic weights between those of the preceding and the following periods. Some of the gaps in Mendelejeff's scheme have already been filled by subsequently discovered elements. Gallium corresponds in atomic weight and in properties to one of the predicted elements, as do also the descriptions of scandium and ytterbium. Mendelejeff's periodic law is expressed in general terms in the following predicate: All the properties of elements, and consequently of the compounds which they form, are functions of their atomic weights, to which they stand in periodic relations. In the following table all the known elements are arranged in the order of their atomic weights. The horizontal series gives the successive cycles in which the period of progressive development is completed; and the vertical series, the natural or homologous orders of elements in which the same properties reappear.

In the following table, it will be seen, tellurium is the only substance which is out of place. Possibly a redetermination of its atomic weight will give it in this respect the position between antimony and iodine which its intermediate properties indicate. Iron, manganese, and chromium, which differ very slightly in atomic weight, do not exhibit the close resemblance in behavior and properties which the theory requires; and cobalt and nickel, which have almost identical atomic weights and densities, possess, in some respects, quite dissimilar properties. Other differences as remarkable are shown by potassium and calcium, and other proximate elements. Copper, which has many analogies with mercury, here falls in a different group. The gradations of properties are certainly not uniform and proportionate to the atomic weights in the different series, being excessive, for example, between carbon, nitrogen, oxygen, and fluorine.

Besides the density, the malleability, ductility, fusibility, volatility, and conductivity to heat and electricity of elements seem, in the same manner, to be subject to periodic variations following the increasing order of their

atomic weights. Lothar Meyer has constructed a graphic representation exhibiting the relation of the physical properties of the elements to their atomic weights and volumes. The elements are arranged at distances from the origin along the axis of abscissæ proportional to their atomic weights. The ordinates of the curve indicate their atomic volumes, and the curve the variations of these in their successive order. From the portions of this curve which have been determined, it appears that it represents also variations in the above-mentioned physical properties. It is seen that the position of the elements on the ascending or descending portions of the curve determines their properties, which may thus be very different for bodies possessing nearly the same atomic weight, and yet harmonize in a remarkable manner with the other terms of the theory. The light metals which occupy the summits and contiguous descending parts of the curve are ductile; and the heavy metals at the bottom and lower part of the ascending curve are partially ductile. In the fourth group the ductility is seen to increase and diminish twice in one period of the variations of density. Fusibility and conductivity, with increasing atomic weights, exhibit the same principle of variability. Crystalline form and expansibility by

heat are found also to depend upon atomic weight, according to the same law of periodicity. Fizeau's experiments have proved that the co-efficient of expansion rises and sinks regularly as the atomic weight increases. Dulong's law of relativity between atomic weights and specific heats, probably for lack of exact measurements, can only be determined in cases where atomic weights and atomic volume are both low. Dulong's law is not periodic, the specific heat being uniformly inversely proportional to the atomic weight. Lecoq de Boisbaudran has proved that, in the homologous series of elements, the wave-lengths of the luminous rays which they emit are proportional to their atomic weights. The electro-chemical character of the elements follows the law of periodic variations, the passage from the electro-positive to the electro-negative character taking place in certain groups twice in the same period of density variation. The electro-chemical condition governs the power of combination, to a certain extent; the stable protoxides, for example, being formed with electro-positive metals, and powerful acids rich in oxygen with electro-negative elements. Electro-negative hydrogen, on the contrary, forms its most stable simple compounds with electro-positive elements.

In each of the periodical series the capacity of combining with oxygen seems to increase up to a certain point, and then to decrease. The series headed by silver may be taken as a type of the oxygen compounds formed by the elements in the other periods, the formulæ being here doubled for the sake of uniformity:

Ag_2O ; Cd_2O_2 ; In_2O_2 ; Sn_2O_4 ; Sb_2O_5 ; Te_2O_5 ; I_2O_7 ; OsO_4 ; IrO_2 ; PtO_2 .

The first five members of every period but one follow these types exactly. The variations of affinities for chlorine and hydrogen within the groups are made evident by the following formulæ, combinations with hydrogen being confined to the last four terms of the groups:

Li Cl ; G Cl_2 ; B Cl_3 ; C Cl_4 .

Na Cl ; Mg Cl_2 ; Al Cl_3 ; Si Cl_4 .

C H_4 ; N H_3 ; O H_2 ; F H .

Si H_4 ; P H_3 ; S H_2 ; Cl H .

Dumas, to whom the merit of grouping the elements into natural families belongs, called attention again to Prout's neglected hypothesis in 1879. The French chemist discovered simple numerical relations between the metalloids and some of the families of metals belonging to each group. In the sulphur group, for instance, at the head of which oxygen is now placed, there is a progression representing additions to the atomic weight of the initial body of multiples of a common difference. Starting with oxygen, whose atomic weight is 8, the next member, sulphur, has the atomic weight 16, formed by the addition of the increment 8; selenium has 40, corresponding to the addition of four times this difference to the weight of oxygen; and tellurium 64, an increment of seven times the difference. In the lithium and magnesium groups there are like simple progressions. In the families of fluorine and nitrogen he has established arithmetical relations of a more complex order.

A recalculation of atomic weights, based on the determinations of Stas and other data, has impelled Professor F. W. Clarke, following Mallet and Dumas, to revive the abandoned hypothesis of Prout, according to which the atomic weights of all the elements are multiples of the atomic weight of hydrogen. Among the 65 determined elements when their atomic weights are referred to that of oxygen, in order to avoid the multiplication of the variation of oxygen from Prout's hypothetical law, it is found that 39, as calculated by Clarke, do not vary more than 0.1 from exact multiples of the atomic weight of hydrogen; and of the remaining 26, 3 are almost exact half-multiples; 5 are rare or vaguely determined elements; 2 are subject to the constant error from the occlusion of oxygen, detected by Dumas in the case of silver, potassium, and iodine; 1, thallium, is brought within the limit by a correction of Crookes's calculation; 2, glucinum and ytterbium, can also be brought by a recalculation within the limit; and 1, antimony, is almost an exact multiple of hydrogen, according to a recent analysis of the bromide; for 4,

mercury, chromium, vanadium, and gold, new determinations are wanted; and the remaining 8 are still subject to slight revision. Professor Clarke concludes, then, that as three fourths of the well-determined atomic weights agree with Prout's hypothesis, the seeming exceptions may be due to undetected constant errors, such as have been brought recently to light in some of the most familiar bodies in the entire list of elements.

Maximilien Gerber has sought to determine common factors in the atomic weights of the component members of each of the elemental groups, and has determined empirically certain common divisors in the several groups whose multiples vary but slightly from the experimentally-determined atomic weights. In the group of mono-atomic elements the common factor is 0.769. The alkaline metals, lithium, sodium, potassium, rubidium, and cesium, which combine with oxygen after the type R_2O , and with chlorine according to the formula R Cl , have, excepting the last named, the additional common factor 3. The non-metallic halogens, fluorine, chlorine, bromine, and iodine, are another division of this class, and are likewise multiples of 0.769.

The atomic weight of hydrogen is related to this number in the ratio 10:13, and that of silver is an exact multiple. The di- and tetra-atomic elements have the common divisor 1.995. Oxygen has an atomic weight equal to eight times this number, and the weights of sulphur, selenium, and tellurium are multiples of that of oxygen.

The alkaline-earthly metals, magnesium, calcium, and strontium, which have the combining formula RO , have the quadruple of the original factor for a divisor; but barium, which belongs to the same group, does not. Carbon, silicon, titanium, zirconium, and tin, have only the one common factor. Mercury, molybdenum, tungsten, and uranium, are also multiples of this number. The tri- and penta-valent elements, the group of nitrogen, boron, etc., which form a stable oxide of the type R_2O_3 , and chlorides of the types RCl_3 or RCl_5 , have most of them the common factor 1.559 in their atomic weights. The fourth and most numerous class, combining into the oxides RO and R_2O_3 , have atomic weights which are approximate multiples of 1.245. Gerber's provisional determination of common divisors is found to agree with two recent corrections of atomic weights: that of tellurium, which, as redetermined by Will, is 127.8, a number which accords better with Mendelejeff's scheme; and that of glucinum, which, according to the findings of Nilson and Petterson, should not be classed among the diatomic alkaline-earthly metals, as its oxide is of the type R_2O_3 , as originally established by Berzelius, and its atomic weight must therefore be taken as 13.65.

AUSTRALIA AND POLYNESIA. I. GENERAL STATISTICS.—The area (in square kilo-

metres; 1 square kilometre = 0·386 English square mile) and population of the principal divisions of Australia and Polynesia are given as follows in the new volume of the "Bevölkerung der Erde" (sixth volume, Gotha, 1880):

DIVISIONS.	Area.	Population.
Australia.....	7,696,598	2,178,668
New Zealand and adjacent islands....	272,989	477,844
New Guinea and islands.....	807,956	500,000
Oceanic islands.....	176,184	879,850
Total.....	8,958,727	4,031,000

II. BRITISH POSSESSIONS.—The following table exhibits the area (in English square miles) and population on December 31, 1879, of the Australasian colonies of Great Britain, according to a statistical abstract prepared by the Registrar-General of New South Wales:

COLONIES.	Area.	Population.
New South Wales.....	310,983	734,282
Victoria.....	33,198	899,833
South Australia.....	380,070	259,287
Queensland.....	660,520	217,851
Tasmania.....	26,215	112,469
Western Australia.....	1,000,000	28,668
Total.....	2,474,941	2,251,890
New Zealand.....	105,842	463,729
Total for Australasian Continent	2,580,283	2,715,619

The movement of population in the several colonies was as follows in 1878:

COLONIES.	Births.	Deaths.	Marriages.	Immigrants.
Victoria.....	26,581	12,702	5,092	42,263
New South Wales.....	25,323	10,763	5,817	39,579
Queensland.....	7,397	4,220	1,444	16,189
South Australia.....	9,252	8,749	2,299	14,572
Western Australia.....	871	394	132	822
Total.....	69,459	31,828	14,834	113,180
Tasmania.....	8,502	1,700	864	9,568
New Zealand.....	17,770	4,642	3,985	16,263
Grand total.....	90,731	38,170	43,583	189,011

The financial condition of the colonies in 1879 was as follows:

COLONIES.	Revenue of 1879.	Public debt on Dec. 31, 1879.
New South Wales.....	£14,475,059	£14,987,419
Victoria.....	4,621,520	20,050,753
South Australia.....	1,662,498	6,605,750
Queensland.....	1,461,824	10,196,150
Tasmania.....	375,867	1,756,800
Western Australia.....	193,315	361,000
New Zealand.....	3,184,905	23,958,811
Total.....	£15,927,488	£77,896,183

The commercial statistics for 1879 were as follows:

COLONIES.	Imports.	Exports.
New South Wales.....	£14,198,847	£18,036,819
Victoria.....	15,085,588	12,454,170
South Australia.....	5,014,150	4,762,727
Queensland.....	3,080,889	8,434,034
Tasmania.....	1,267,475	1,301,097
Western Australia.....	407,299	494,888
New Zealand.....	8,374,685	5,743,126
Total.....	£47,878,768	41,276,856

An intercolonial conference of statesmen convened in Sydney, in January, to consider in what particulars and by what methods federal action would at the present time be desirable. It was the continuation of a conference which was held in Melbourne in the latter part of 1880, which discussed an arrangement regarding the border customs between New South Wales, Victoria, and South Australia. Those three colonies alone participated in the former conference. In the present one all the colonies were represented, informally, by prominent administrative officials. It was composed of the following members: Henry Parks, Colonial Secretary of New South Wales, chairman of Conference; Graham Berry, Chief Secretary, and William M. K. Vale, Attorney-General, Victoria; James Watson, Colonial Treasurer, New South Wales; Thomas Dick, Colonial Secretary, New Zealand; William Morgan, Chief Secretary, and C. Mann, Treasurer, South Australia; A. H. Palmer, Colonial Secretary, and Boyd D. Morehead, Postmaster-General, Queensland; W. R. Giblin, Colonial Treasurer, and W. Moore, Colonial Secretary, Tasmania; Chief-Justice Wrenfordsley, Western Australia.

The final federal union of the Australasian colonies has been looked forward to since the release of the principal colonies from crown administration alike by British and colonial statesmen. Confederation might have been accomplished with less difficulty at the time when the right of self-government was first conferred, and before the development of divergent policies. The conflict of policies and diversity of laws since the growth of population and material prosperity has brought the colonies into closer contact afford the real incentive, while constituting a serious practical difficulty, to the movement, which has been begun, toward conformity and federation.

The greatest actual obstacle in the way of a federal union is the opposite commercial policies pursued by the two leading and contiguous colonies, Victoria and New South Wales. Victoria has lived ten years under a tariff framed for the encouragement of domestic industries, and her people tenaciously adhere to the protective idea. Her neighbor and rival, New South Wales, is equally attached to her revenue tariff, and the people are thoroughly devoted to free-trade principles. The less populous colonies incline to the British doctrine, and have constructed tariffs which do not differ greatly from that of New South Wales, and can, without friction, be brought into exact conformity. The Intercolonial Conference did not hesitate to attack the vital subject of a customs union, although an immediate agreement is out of the question. Amid the protests of Mr. Berry at the proposed "insulation" of Victoria, the conference voted that a joint commission be appointed by the autonomous colonies to construct a common tariff.* Vic-

* West Australia is the only Australasian colony which

toria cast the only dissentient vote. This colony may appoint delegates to the tariff commission, but will not be disposed to abandon easily a tariff system under which powerful interests have grown up.

The commercial rivalry between the two older colonies has entered a sharper stage since the completion, in the early part of 1881, of the railroad from Sydney to the Murray River, where it meets the railroad from Melbourne. The New South Wales ministry have fixed the freight rates at a low figure, in order to attract the trade of the extensive Riverina district away from Melbourne to Sydney. This is a reversal of free-trade principles which provokes the sarcasm of the Victorian statesmen; but against its economic effects they can have no remedy except to conform their tariff to that of the sister colony.

The only actual result of the conference, besides the majority vote in favor of a tariff commission, and the only unanimously approved proposition, was the decision in favor of the establishment of an Australian Court of Appeal. A project was drawn up and adopted for a law to be brought before each of the colonial Parliaments, and then submitted for ratification to the Imperial Government. Fugitives from arrest on criminal charges, or men who have abandoned wife or child, may be apprehended, according to one of the provisions of the proposed legal convention, upon warrants taken out in any one of the colonies, or upon telegraphic notification that the warrants have been issued.

The intercolonial conference in discussing plans looking to confederation did not commit themselves to the conjugate principle of self-maintenance, for, on adopting a resolution recommending the increase of the naval squadron, they rejected a proposal that the colonies should bear half the cost. With reference to outrages committed by islanders in the South Seas, the conference proposed that the High Commissioner who has jurisdiction in such cases should be granted extended powers, but that in felony cases appeal should lie to the Supreme Court of one of the colonies against his decisions. The murders of Bishop Patterson and Commodore Goodenough, and more recent outrages committed by the natives of the Solomon, New Hebrides, Santa Cruz, and New Ireland groups, were probably reprisals provoked by the atrocities of the cruisers for laborers to supply the sugar-plantations of Queensland and other demands for "Karnackies." The practice of kidnapping, and other cruelties of this form of slave-traffic, have continued to the most recent years, if they do not still take place.*

remains under the control of the British Parliament and is governed from Downing Street. For the three classes of British colonies see "Annual Cyclopædia" for 1879, under GREAT BRITAIN AND IRELAND.

* During the year 1881 natives of the Pacific islands have taken reprisals on one British labor-ship and on a French vessel which was probably mistaken for a labor-cruiser. The

In regard to Chinese immigration the harmonious action of the colonies is difficult. The Government of West Australia issued an order encouraging this immigration at the public expense—a step which was condemned by the representatives of all the other colonies. Queensland and South Australia, which also possess territory within the torrid zone, favor limited immigration, while in New South Wales and Victoria intense hostility to the Chinese prevails. The conference embodied their objections to the importation of these laborers by the Government into the crown colony of West Australia in a memorial addressed to Lord Kimberly, British Secretary for the Colonies.

The New South Wales Parliament gave their principal attention, upon convening in the summer, to an act restricting Chinese immigration. A poll-tax of ten pounds is levied on every Chinaman upon landing, and ship-masters are forbidden, under a heavy penalty, to bring more than one to every one hundred tons of ship's burden. The Government is also empowered to quarantine, indefinitely, any vessel carrying Chinese passengers—a provision intended as a menace to deter the importation of these unwelcome producers.

By the returns of the late census it appears that the area of wheat cultivation in Australia has doubled in ten years. South Australia leads in this product. The Australian crop is only one third as great as that of the British Islands, although the area sown is nearly the same. Only about one half of the crop is available for export, and the prices must be high enough to amply remunerate the British wheat-grower before the Australians can export wheat to Europe with a profit. The prospects of gold-mining in all of the colonies are better than they have been for years. New fields have been opened on the northern coast of Australia. In New South Wales new diggings of remarkable richness have been discovered. The opening of gold and tin mines in Tasmania has given that colony a commercial impulse, and produced an influx of capital and immigration such as never were known before.

The revenues of New South Wales continue to increase beyond current wants from the sales of land. The revenue for the year ending March 1, 1881, exceeded that of the preceding year by £1,080,000. The revenue for the fiscal year 1880 was £4,912,000. The Treasurer's estimate for 1881 was £5,440,000, which was considerably exceeded in the receipts for the first half of the year, and promised to reach £6,000,000.

outrages committed by the crews of labor-vessels, notably the brig *Carl*, were made the subject of a Parliamentary investigation eight years ago, and measures were taken by the British Government to suppress the evil. The employers of Polynesian coolies in Queensland are obliged, under a law of the colony, to return them, on the expiration of their term of service, to their native islands. The familiar term for the South Sea coolies among Australians, *Karnackie*, is a corruption of *Kanaka*, the native name for the Sandwich Islanders.

The population was found by the census to exceed 750,000, showing an increase of 250,000 in the ten years. Owing to its vast area of attractive land, it has gained upon the much smaller but still more populous colony of Victoria, the difference between their populations having fallen in the ten years from 250,000 to 100,000. The debt of New South Wales amounts to about £15,000,000; but of this at least £12,000,000 is invested in railroads.

The enormous railroad construction which has been carried out by the Government in New South Wales received its first impetus from the circumstance that the Government found coming into its hands large sums of surplus revenue derived from the sales of public lands which the prosperous sheep-graziers, who had rented them of the Government at $\frac{1}{2}$ d. an acre, commenced to buy in vast blocks at the upset price of £1 per acre. The railroad system, well started with these means, has been extended by loans raised in London. At the beginning of the year, 679 miles of new road were under construction, and surveys for further extensions had been made.

The railroad earnings in 1880 were £1,594,000, being £89,000 more than the Treasurer's estimate, and yielding 4½ per cent on the capital invested. A still larger profit was expected in 1881.

Victoria has for the last four years been passing through a constitutional crisis. Conflicts between the two Houses of the Legislature mark the advances in popular self-government made in the British colonies. In the transition from crown administration to autonomy, the Council, composed of appointees of the crown, is the vehicle through which the Government refuses the popular demands emanating from the representative hall. Under responsible government the Legislative Council is balanced against the popular Assembly as the representatives of the property-holding class, the conservators of the interests of wealth, and the only repository of the veto-power and check upon immature and democratic legislation. This branch thus represents an entirely different constituency from that of the Assembly, which body is elected on the broad basis of universal suffrage. Party majorities in the Upper House for this reason, and because the Councilors hold their seats much longer than delegates in the Assembly, do not change with the transfer of power in the Lower House and the consequent change of ministers. Frequent "dead-locks" are the unavoidable result. The whole political machinery is clogged, useful legislation is rendered impossible, and political passions are excited simply through this defect in the Constitution. This unwholesome condition of affairs has become chronic of late years in the prosperous and democratic colony of Victoria. Mr. Berry, the Premier and Liberal leader, has brought in various bills for the popularization of the Legislative Council. An active Reform League has kept the question before the pub-

lic, and pressed it in the Legislature. The Liberal party made it their sole issue, and were supported by a great popular majority. The Legislative Council and their electors were naturally loath to abandon the only conservative safeguard—the right of those who hold a stake in the country to control the will of the absolute numerical majority.

For four years the ministry were supported by the people in demanding a reform, until all grew tired of the fruitless agitation. An appeal had even been made to the Imperial Government. In March Mr. Berry introduced into the Assembly a final compromise measure, reducing the tenure of seats in the Council, one third of which should be refilled every three years, from ten to six years, and lowering the limitations of the franchise. The bill passed the Legislative Assembly but was rejected by the Council, March 25th, on the ground that a bill affecting the powers and composition of that House should originate there. The Council had itself passed a reform bill of its own. The subject was next discussed in a joint committee, but without result. The Berry bill was finally, considerably altered by the amendments, passed by the Council in the middle of May. The measure reduces the property qualification for Councilors to £100, and fixes the qualification for freehold electors at £10, and for occupiers at £25 annual rental. The qualifications for electors and candidates under the old law were respectively a freehold of £50 and one of £250 annual value. The number of electors is increased by this sweeping reform from 32,000 to 108,000, and the number of members from thirty to forty-two. There are supposed to be only about 80,000 citizens, who vote for members of the Lower House, that are not possessed of sufficient property to qualify them as electors of members of the Council.

The reform act which was the final outcome of the long struggle was not satisfactory to the people. The Legislative Council had given up the limited franchise to the extent of reconstituting itself on nearly as broad a basis of popular representation as the Lower Chamber. It had abandoned the controlling voice of property; but it had not sacrificed any part of its equal legislative authority. The public looked upon the reform act as an extension rather than a curtailment of the powers of the Council. It was supposed to contain no remedy for the "dead-locks," which were the actual ground and reason for reform. As a result of the popular disappointment in the measure, the Legislative Assembly in the beginning of July passed a vote of want of confidence in the ministry. The Governor refused to dissolve Parliament, and, upon the resignation of Berry and his colleagues, called upon Sir Bryan O'Loughlen to form a Cabinet, in which, after some difficulty and delay, he succeeded.

The returns of the decennial census place the population of Victoria at 845,977, composed of 438,186 males and 407,791 females.

These numbers are exclusive of 11,835 Chinese and 770 aborigines. Melbourne, the capital, has a population of 65,675. The cities or towns in the colony with a population of over 20,000 are the following: Ballarat, 22,425; Collingwood, 23,797; Emerald Hill, 25,178; Fitzroy, 22,979; Prahran, 20,306; Richmond, 23,294; and Sandhurst, 28,128. In 1836 the population of the whole colony was 224; in 1838, 3,511; in 1841, 11,738; in 1846, 32,879; in 1851, 77,345; in 1861, 540,322; in 1871, 731,528; in 1881, 858,582.

The gold-mining industry of Victoria has within a year or two begun to show slightly increased activity and profits. The quantity of gold produced in 1880 was 829,121 ounces, 529,195 from quartz-mines and 299,196 from alluvial mines, being 70,173 ounces more than the total of 1879. The number of miners employed was 38,568, an increase of 1,000. The number of Chinese employed has diminished of late years; in 1880 there were 8,486—624 less than in 1879. The engines used in quartz mining give 16,488 horse-power in the aggregate, and those employed in alluvial mining 6,041 horse-power. In the mines at Stawell the shafts have reached from 1,220 to 2,410 feet below the surface. The principal improvement in the returns of 1880 was in the quality as well as the quantity of the quartz crushed. There are 3,630 auriferous reefs known. Alluvial deposits, which are covered over by eruptive rocks, are located by boring through the thick overlying basalts with the diamond drill. The considerable increase in the product is said to be due to the use of this tool, which was first tried in 1880. £16,894 was paid into the colonial Treasury for mining privileges in 1880. The aggregate production of gold in Victoria since the first discovery of the gold-fields has been more than \$1,000,000,000.

The ministry of South Australia handed in their resignations March 19th, and a new Cabinet was formed by William Morgan, in which J. H. Symon was Attorney-General; G. S. Swan, Treasurer; and Thomas Playford, Commissioner of Lands and Immigration. This ministry resigned in June, and were succeeded by John Cox Bray, Chief Secretary and Premier; John W. Downer, Attorney-General; Lavington Glyde, Treasurer; Alfred Catt, Commissioner of Crown Lands and Immigration; and John Langdon Parsons, Minister of Education. The finances, as in all the Australian colonies, are in a prosperous condition. The revenue for the year ending June 25th exceeded that of the preceding year by £165,000.

Queensland has abandoned the policy pursued by the other colonies, of building railroads with state means, and adopted the American plan of subsidizing private corporations with belts of land along the route of lines constructed by them. On such conditions an English company has undertaken to build a railway across Queensland to the Gulf of Carpentaria.

Tasmania is growing in population, but its imports from the United Kingdom in 1879 decreased by £36,416 as compared with 1878. They also decreased from the Australian colonies. The wool-clip had gained 16 per cent as compared with the weight in 1874. Gold-mining was never so productive as in 1879. The average number of persons employed in it was nearly twice the number in 1878; the quartz yielded the highest average of the last ten years; and the value of the gold produced, £230,895, was more than double the value of the previous year. The exports of other products were less than in the two preceding years. Tasmania has still twelve and a half million acres of arable public land unsold to distribute among agricultural immigrants; the average of land under cultivation in 1879-'80 was considerably less than half a million acres.

The question of the monopoly of the land by large sheep-raisers is one of exciting moment in some of the Australian colonies, particularly New Zealand. Of a total area in both islands of 64,000,000 acres, there are about 44,000,000 acres adapted for tillage or pasture, of which 16,000,000 belong to the Maoris and their assignees, 14,000,000 have been sold to Europeans, and 14,000,000 remain the property of the Government. Nearly the whole of the Government land is farmed out on terminable leases to about nine hundred sheep-farmers, who pay for their licenses an annual sum to the Government of about £110,000. The terms on which the crown lands are open to purchase are not similar in different land districts, but discouraging in all. In some sections the lands are offered at public auction, with the limitation of an upset price of £1; in others at private sale, but at the minimum price of £2. A popular feeling has naturally arisen against the large sheep-runs whose owners seem to be favored by the laws, which is taking political shape in a demand that the public lands should be offered to settlers on inviting terms. The expectation that this would result in a great extension of agriculture and dependent industries is not likely to be realized. Wool is destined to remain for some time the only profitable product, the prices of meat and grain being exceedingly low and wages high. There are in the whole colony not above 800,000 acres sown to crops of all kinds. There are about 13,000,000 sheep in New Zealand, chiefly merinos, with a mixture in the plains of the standard British breeds. The exports of wool, for the year ending March 1st, amounted to over £3,500,000. Among the exports for the same year figure six million or more rabbit-skins, valued at some £57,000. These animals have so multiplied in certain districts as to become a source of danger to the sheep-growing industry, and the Government has consequently co-operated with the local authorities in a plan for exterminating them by poison. A special official employs men to scatter in their way grain

steeped in phosphorus. The only other risk the sheep-grazer has to encounter is the occasional occurrence of inundations. Of the "squatters" who raise sheep on the public land some possess flocks numbering 200,000 or 300,000, one as many as 500,000, and a considerable number owning from 50,000 to 100,000 sheep.

In the autumn an outbreak of the Maori population was threatened. The cause of the trouble was the survey of territory occupied by natives, preliminary to opening it to white settlement. It was a district in the province of Taranaki which was declared confiscated by the Government after the Waikato war. In the confiscated territory, Te Whiti, a chief who has been converted to Christianity and passes for a prophet among the natives, fixed his residence and gathered the discontented natives around him. The same man championed the cause of natives who were expelled from their lands two years before, and nearly brought about a collision between them and the Government. The danger of an outbreak was still more imminent this time, but was averted by the prompt capture and arrest of the instigator.

The British possessions in the Pacific have been increased by the annexation of the Island of Rotumah, which has been placed under the direction of the Governor of the Feejee Islands. The new dependency has an area of about twenty-four square miles, and contained in 1871 2,680 inhabitants. A massacre was perpetrated by the Christian natives of Tapitawa, one of the Equator Islands, under the leadership of a convert named Kabu. The victims were the inhabitants of the southern portion of the island, who had renounced Christianity, and refused to submit to the rule of Kabu.

AUSTRO-HUNGARIAN MONARCHY, an empire in Central Europe. Emperor, Francis Joseph I, born August 18, 1830; succeeded his uncle, the Emperor Ferdinand I, December 2, 1848. Heir-apparent to the throne, Archduke Rudolphus, born August 21, 1858; married on May 10, 1881, to Stéphanie Clotilde, second daughter of the King of Belgium, born May 21, 1864.

The Ministry for the Common Affairs of the Empire consisted, toward the close of the year 1881, of Count Kalnoky, Minister of Foreign Affairs and of the Imperial House (appointed 1881); Joseph von Szlavay, Minister of the Finances of the Empire (appointed April 8, 1880); and Count Arthur Bylandt-Rheidt, Minister of War (appointed 1876).

The Ministry of Cisleithan Austria, at the close of 1880, was composed of Count Eduard Taaffe, President (appointed August 14, 1879); Baron Pino, Justice (1881); Baron Sigmund Conrad von Eybesfeldt, Public Worship and Instruction (1880); Count Zeno von Welsersheimb, Defense of the Country (1880); Count Julius von Falkenhayn (August 14, 1879), Agriculture; Dr. Alois Prazak, Commerce (1881);

Dr. Julian Dunajewski, Finance (1880); Florian Ziemiakowski (April, 1873).

The area of the entire monarchy is 622,837 square kilometres; population, according to the census of 1880, 37,741,413. The area of Cisleithan Austria, or Austria proper, is 300,249 square miles; the population, according to the census of 1880, was 22,130,684. The population of the different crown-lands, according to the census of 1869 and that of 1880, was as follows:

COUNTRIES.	1869.	1880.
Austria below the Enns	1,990,708	2,829,021
Austria above the Enns	736,557	760,879
Salzburg	153,159	168,566
Styria	1,137,990	1,212,367
Carinthia	337,094	348,670
Carniola	466,334	481,176
Trieste	127,547	144,437
Goritz and Gradisca	206,244	210,241
Istria	266,734	295,854
Tyrol	782,753	805,326
Vorarlberg	103,086	107,364
Bohemia	5,146,544	5,557,134
Moravia	2,017,274	2,151,619
Silesia	513,352	565,772
Gallcia	5,444,689	5,958,170
Bukowina	513,404	569,599
Dalmatia	458,611	474,489
Total	20,396,630	22,130,684

The population of the principal cities and towns, according to the census of December 31, 1880, was as follows:

Vienna (without suburbs)	707,532
Prague	159,502
Lemberg	108,000
Grätz	93,351
Brün	91,569
Cracow	60,679
Pilsen	38,132
Linz	35,517
Czernowitz	31,200
Reichenberg	27,300
Laybach	24,940
Budweis	23,064
Salzburg	22,825
Neustadt (Wiener)	21,637
Iglau	21,565
Olmutz	20,124
Goritz	19,483
Trappau	19,239
Innspruck	19,183
Prossnitz	19,013
Steler	16,919
Klagenfurth	16,670
Aussig	16,503
Marburg	17,628
Teplitz	15,684
Warmsdorf	15,082

In accordance with the political constitution of the Austrian Empire, there are three distinct budgets: the first, that of the delegations for the whole empire; the second, that of the Reichsrath for Austria proper; and the third, that of the Hungarian Diet, for the kingdom of Hungary. By an agreement, or so-called "compromise," entered into in February, 1868, between the Governments and Legislatures of Austria and Hungary, the former has to pay seventy and the latter thirty per cent toward the common expenditures of the empire, not including the interest on the national debt. The common budget of the empire for 1880 was as follows:

REVENUE.	Florins. (1 florin = 45 cts.)
Ministry of Foreign Affairs.....	632,880
“ of War.....	2,708,775
“ of Finance.....	1,860
Supreme Court of Accounts.....	286
Customs, net receipts.....	5,000,000
Matricular contributions:	
From Hungarian Treasury.....	2,155,537
“ Cisleithania (70 per cent.).....	73,844,006
“ Transleithania (80 per cent)....	31,686,389
Total.....	116,029,683
EXPENDITURES.	Florins.
Ministry of Foreign Affairs.....	4,153,900
Ministry of War:	
Army.....	101,509,531
Navy.....	8,264,902
Ministry of Finance.....	1,880,550
Supreme Court of Accounts.....	125,500
Total ordinary expenditures.....	116,029,683
Extraordinary expenditures.....	12,506,538
Total.....	128,536,216

The budget estimates for 1880 for Austria

proper gave the net revenue at 301,109,093 florins, and the expenses at 425,551,018 florins. The floating debt of the whole empire on January 1, 1880, amounted to 411,999,923 florins. The public debt of Austria proper on January 1, 1880, was as follows:

TITLE OF DEBT.	Bearing interest.	Bearing no interest.	Total.
Consolidated debt.....	2,890,260,457	117,428,351	3,007,688,839
Floating debt.....	132,993,107	862,538	133,855,945
Rentes for damages.....	12,549,208	12,549,208
Rentes to Bavaria..	1,750,000	1,750,000
Total.....	3,037,552,772	118,291,159	3,155,843,966

The commerce of Austro-Hungary, comprising imports and exports of merchandise and of bullion, was as follows in each of the years from 1870 to 1878 (value expressed in Austrian florins):

YEAR.	AUSTRO-HUNGARIAN CUSTOMS TERRITORY.				CUSTOMS TERRITORY OF DALMATIA.	
	Merchandise.		Bullion.		Imports.	Exports.
	Imports.	Exports.	Imports.	Exports.		
1870...	436,000,000	395,400,000	41,000,000	84,100,000	9,200,000	6,600,000
1871...	540,800,000	467,600,000	59,400,000	55,500,000	8,600,000	7,500,000
1872...	613,400,000	384,600,000	86,500,000	66,100,000	9,200,000	6,900,000
1873...	588,100,000	423,600,000	40,900,000	31,100,000	9,700,000	6,100,000
1874...	568,700,000	446,300,000	19,900,000	18,900,000	10,300,000	6,500,000
1875...	552,600,000	504,500,000	16,100,000	18,700,000	13,400,000	10,400,000
1876...	518,000,000	508,600,000	35,300,000	30,900,000	13,500,000	8,200,000
1877...	546,700,000	550,600,000	30,500,000	15,500,000	13,900,000	8,600,000
1878...	596,700,000	599,700,000	52,600,000	15,700,000	13,600,000	6,900,000

The following statement shows the strength of the commercial marine of Austro-Hungary on the 1st of January, 1880:

CLASSES OF VESSELS.	Number of vessels.	Tonnage.	Crews.
Sea-going steamers (16,000 h. p.).	72	58,604	2,237
Coasting steamers (996 h. p.) ...	82	1,677	217
Sailing-vessels, including coasters and fishing-smacks	8,122	270,891	24,972
Total	8,226	330,612	27,426

The army in 1880 consisted, on a peace footing, of 16,635 officers and 275,571 men; and on a war footing, of 29,653 officers and 1,013,953 men.

The naval force at the end of the year 1879 was 58 vessels, of 16,086 horse-power, and 320 guns. The total length of railways in operation on January 1, 1880, was: in Austria proper, 11,352 kilometres; in Hungary, 7,029; total, 18,381. The length of the telegraph wires and lines, and the number of stations, and the messages sent, were in 1878 as follows:

	Austria.	Hungary.	Total.
Lines.....	84,603 kil.	14,329 kil.	48,932 kil.
Wires.....	88,331 "	50,072 "	138,453 "
Stations.....	2,484	960	3,444
Messages.....	5,538,331	2,532,259	3,870,590

The following table shows the length of railroads built during the past fourteen years (in kilometres):

YEAR.	Austria.	Hungary.	Total.
1867.....	150.14	123.19	303.32
1868.....	460.16	875.62	538.73
1869.....	731.05	133.23	564.34
1870.....	862.71	739.78	1,602.38
1871.....	1,207.55	921.32	2,128.88
1872.....	1,154.41	974.72	2,129.18
1873.....	835.17	865.71	1,703.88
1874.....	832.93	171.92	504.56
1875.....	674.23	2.85	677.18
1876.....	443.66	254.19	727.86
1877.....	477.94	73.56	551.51
1878.....	47.04	217.76	264.80
1879.....	77.16	59.73	136.94
1880.....	40.13	20.08	60.21

The breach between the Constitutional party and the ministry, which had assumed so large proportions in 1880, continued during the year 1881, and Count Taaffe was forced still more than in 1880 to look for support from the Right. The first result of this policy was the resignation of Baron Streit, the Minister of Justice, and Ritter von Kremer, Minister of Commerce, who were succeeded, the former by Baron Pino, and the latter by Dr. Prazak. Count Taaffe met an unexpected obstacle in his desire to depend upon the Right, in the Herrenhaus, or House of Lords. To overcome this he created twelve new life-members, of whom four were Poles, two Czechs, and six Clericals or Conservatives, all factions of the Right being represented.

A new feature in the struggles of the German and Slavic nationalities was the proposition to transform the old German University of

Prague, one of the earliest in Germany, into a bilingual establishment; or, leaving the University of Prague in its old position, to establish a new Czech university. The efforts of the Czech party were directed in 1880 to getting its teachers gradually introduced, and a resolution was passed by the House authorizing the Government to ask from it the grant of money necessary for this purpose. In the estimates presented for 1881 no such grant was asked for. Upon the demands of the Czech party, the Government appointed a commission to investigate the feasibility of the plan. The matter was settled by an imperial order in April, providing that henceforth two separate universities should exist under the common name of "Carolo-Ferdinandea," in one of which the medium of instruction shall be the German, and in the other the Czech language. The two faculties of Philosophy and Law were to be in readiness by October 1st. On May 15th the Government presented to the Chamber two bills relating to this matter. One related to the legal status and the course of study, while the other provided for the necessary credits for creating the two Czech faculties. The sum necessary for this purpose was set down at 23,000 florins for the current year. The first bill provided, among other matters, that all property belonging to the university, or to any of the faculties, should in future be regarded as the common property of both universities, or of the respective faculties. A student can not be immatriculated in both universities, but a student of one shall be at liberty to attend the lectures of the other, and these lectures are to be credited to him as if he had attended them in his own university. The bill was passed on May 31st, after a motion making it compulsory upon every student at the new Czech university, who should intend entering a public profession, to have a perfect knowledge of the German language, had been rejected.

In the early part of the year a bill was introduced in the Lower House by Herr Lienbacher of the Clerical party, providing that in future any provincial Diet should have the power of decreasing the term of compulsory school attendance, which heretofore had been eight years. The bill was supported by the Autonomist party, who thought in this way to increase the autonomy of the several crown-lands, and was strongly opposed by the Constitutional party. It passed the Lower House with a majority of 13, but was rejected by the Herrenhaus by the decisive vote of 74 to 82, a vote which was entirely unexpected, as it was thought that the recent creation of new life-members had given the ministry who supported the bill a majority in this House.

On March 11th Count Coronini, the President of the Lower House of the Reichsrath, resigned his seat in that House. In his letter of resignation, Count Coronini, who belongs to the Constitutional party, declared that he had endeavored to do his duty according to his best

belief, but that the conscientious fulfillment of duty did not insure success. He did not think that he could interpret the events that had taken place in the House of late, otherwise than by concluding from them that he no longer possessed the confidence of the House. He had become painfully aware that, in these circumstances, he could no longer be of service to the House, and he had, therefore, decided to give up his position. As the rules of the House did not allow of his resignation, and as he was not certain that the House would accede to his request to relieve him from the office, he had chosen the only course open and had resigned his seat. His seat was filled by the election of Dr. Smolka, the First Vice-President, while Prince Lobkowitz was elected to fill the latter post, so that the presidency, as well as both vice-presidencies, had now passed into the hands of the majority.

The session of the Reichstag was closed by the Government in June.

The continual anti-German policy of the Government brought about a union of the two factions of the Liberal and Constitutional parties into a German party, a union which was heartily approved by Dr. Herbst, the leader of the Constitutional party.

In April the Emperor sanctioned a measure empowering the Cisleithan ministry to raise a 5 per cent loan of 50,000,000 florins, which amount was required to make up the deficit in the last budget of this half of the empire. The loan was at once subscribed, and twenty-five times over, the amount actually offered being upward of 1,250,000,000 florins. The real amount of the issue was 54,347,800 florins, the price being at 92.

The foreign relations of the empire during the year were of the most friendly character. In August the Emperor met Emperor William of Germany at Gastein, and the usual demonstrations of friendship were made, while the meeting was said to be without any political significance.

On October 27th, King Humbert and Queen Margharita of Italy arrived in Vienna on a visit to the imperial family. It did not transpire what occurred at this meeting, but it was generally agreed that the greatest political significance was to be attached to it. It was regarded as marking the admission of Italy to the Austro-German alliance, while it was thought that at the same time questions relating to the estates of the deposed princes of Naples and Parma, who were closely related to the imperial family of Austria, were definitely settled. They were received with great demonstrations of friendship, and on their return the Emperor accompanied them as far as Venice.

The era of good feeling between the empire and Italy, which seemed to have been brought about by the visit of King Humbert, was threatened by some remarks made during a debate in the Hungarian delegation. At a committee-meeting, which was held with closed doors,

after Baron von Kallay, a chief of department in the ministry of foreign affairs, had stated that, in spite of the Irredenta movement, Austria entertained the most cordial relations toward Italy, Count Andrassy, who was at the time looked upon as the probable successor of Baron Haymerle, was thereupon reported to have stated, in the course of a speech, that he no longer feared the Irredenta movement, since the bond between the monarchy and Germany had become so strong. If the movement should lead to a war between Austria and Italy, and the latter country should be defeated, it might bring about serious consequences for the royal house of Italy. These remarks caused considerable excitement, and it was even stated that the Italian ambassador was about to ask for his passports. In the full meeting of the Hungarian delegation of November 8th, Baron von Kallay declared the report of the meeting with these remarks to be incomplete, and added that he had laid particular stress upon the friendly relations brought about by the late visit of King Humbert, which seemed to have been received with satisfaction by all classes of the Italian population. Count Andrassy called to mind the fact that he had accompanied the Emperor to Venice, and that during his term of office he had kept up friendly relations with Italy.

The meeting of the Emperors of Germany and Russia at Dantzic, in September, called forth considerable surprise in Austria. But the prevailing feeling was that it would tend to strengthen the Austro-German alliance, and the Government hastened to give expression to this feeling in a dispatch to the Emperors at Dantzic, declaring its satisfaction at the meeting.

The assassination of the Emperor of Russia called forth expressions of sympathy from the Emperor. In the Upper House of the Reichsrath, the President gave expression at its first session to the feelings of abhorrence of the House at the crime. He said the event was the more painful, on account of the indication it gave of the existence of a dark but wide-spread conspiracy, threatening to undermine the principles of society, which the Upper House was bound to stand in the front rank to defend. The President, in conclusion, called upon the members present to rise from their seats in order to testify to the sorrow they experienced at this event, as well as to the sympathy they felt with the grief which filled the heart of the Austrian monarch, who in the Emperor Alexander II had lost a true friend. The President's remarks were warmly applauded. In the Lower House, however, the Poles declared that they could not vote for any resolutions of regret, and the new President, Smolka, a member of the Polish party, refused to permit any resolution of the kind to be discussed.

The monarchy suffered a severe loss in the death of Baron Haymerle, who died suddenly on October 10th, of apoplexy (see HAYMERLE).

He succeeded Count Andrassy as Minister of Foreign Affairs in 1879, and had continued to hold the office. This vacancy was filled by the appointment of Count Kalnoky, the former ambassador to Russia.

The victory of the Czechs in the university question was followed by excesses in Prague. Attacks were made on several occasions by the Bohemian students upon the Germans, and it was necessary for the authorities to interfere in behalf of the latter. The Ministry of Education, upon the recommendation of the senate of the university, ordered a suspension of the lectures for the summer, and a strict investigation. A number of Czech journals, which attempted to continue the agitation, were confiscated. Other excesses took place later in the year, in consequence of which the administration of the crown-land was placed in the hands of Field-Marshal Kraus, who had been up to that time the military governor.

The Czech excesses in Prague called forth the greatest indignation among the German population of the empire, notably in Vienna, where the Common Council passed resolutions condemning those excesses, while the language employed by the Liberal journals of that city was so strong as to cause the suspension of the latter.

A demand was made by the Czechs, that as Vienna was the capital of a state containing many different nationalities, of whom the Czechs formed a large part, that Czech teachers be employed in the public and industrial schools of that city. This demand was promptly met and denied by the Town Council.

The City Council of Prague, which is entirely in the hands of the Czechs, ordered that the children of Bohemian parents who were attending German schools should be removed from them. The councils of other communities passed similar resolutions, and, in consequence of the troubles arising therefrom, the matter was brought before the Provincial School Council. This body annulled the order of the city councils, and declared that it rested entirely with the parents to which school they wished to send their children.

On August 12th the Czech National Theatre in Prague was completely destroyed by fire a few days before it was to be opened. This conflagration called forth the deepest sympathy in all parts of the monarchy, and the Germans particularly tried to show, by their sympathy and their contributions to the collection which was taken up for its restoration, that they bore no ill-will to their Bohemian neighbors, and that it was their earnest desire to do away with the struggle between the different nationalities.

The marriage of the Crown Prince Rudolph to Stéphanie, the second daughter of the King of the Belgians, took place on May 10th, in Vienna. The ceremony was performed by Cardinal-Prince Schwarzenberg, Archbishop of

Prague, in the chapel in the Burg, the Imperial Palace, in the presence of the King and Queen of the Belgians, the Prince of Wales, the Prince and Princess of Prussia, and many others of high rank. The day was given up to public festivities, and the wedding called forth the greatest demonstrations of joy, not only on the part of the Viennese, but throughout the empire. After the ceremony, the bridal pair set out on a tour of the provinces, and were everywhere received with demonstrations of affection.

The Archduke Rudolph Francis Charles Joseph, Crown Prince Imperial of Austria, Crown Prince Royal of Hungary and Bohemia, was born August 21, 1858. He is the son and second child of the Emperor Francis Joseph and of the Empress Elizabeth, who was a daughter of Duke Maximilian of Bavaria.

Princess Stéphanie Clotilde Louise Marie Charlotte, second daughter of King Leopold II of the Belgians, and Queen Marie, a daughter of the Archduke John of Austria, Palatine of

Hungary, was born at Laeken, Brussels, on May 21, 1864.

Vienna was visited on December 8th by one of the most disastrous conflagrations on record. The Ring Theatre was completely destroyed by fire, during which nearly one thousand persons were supposed to have lost their lives. The fire broke out at ten minutes before seven, when the theatre was already comfortably filled, and spread rapidly. In the rush for escape which ensued, the passages and doors became blocked, making exit an impossibility, especially from the galleries, and when the firemen entered the building they found heaps of dead bodies everywhere.

The Austrian census is taken at irregular intervals. The last census was taken on December 31, 1880, the one previous to that in 1869. It contains, as in almost all other European countries, only statistics of population. The population of Vienna, according to the last census, was 707,532, an increase of about 100,000 upon the population of 1869.

B

BACON, LEONARD, D. D., a distinguished American Congregationalist clergyman, born in Detroit, Michigan, February 19, 1802; died in New Haven, Connecticut, December 24, 1881, having nearly completed his eightieth year. His father was a missionary to the Indians in the then "great West," and died in 1817, leaving three sons and four daughters. Leonard's preparatory education was at the Hartford school, and in 1817 he entered the Sophomore class in Yale College. Among his classmates was Theodore D. Woolsey, afterward President of Yale, and a life-long friend and fellow-worker. Having been designated for a minister from the first, he entered Andover Seminary in 1820, where he prosecuted his theological studies for four years. In March, 1825, he was ordained after the Congregational pattern, and invited to the pastorate of the First Congregational Church of New Haven, the oldest society of this denomination in that city. Among his predecessors had been Moses Stuart, professor at Andover, and Dr. Taylor, professor in the theological seminary at New Haven. The position thus entered upon by the young and ardent minister was retained by him for forty-one years, when (in 1866) he was made Professor of Theology in Yale College. He was also appointed lecturer on ecclesiastical history and American Church history. In March, 1874, he was moderator of the council which met in Brooklyn, New York, and took part in pronouncing a rebuke to Henry Ward Beecher's society for expelling Theodore Tilton without a formal trial. In February, 1876, he was moderator of the advisory council called by the Plymouth society in regard to the not altogether savory

scandal, well known throughout all the country. Dr. Bacon was an active worker in periodical literature as well as in the special duties of his profession. From 1826 to 1838 he was one of the editors of "The Christian Spectator," a religious magazine published in New Haven. In 1843 he aided in establishing "The New-Englander," a bi-monthly, and kept up his connection with it to the end of his life. He was also one of the founders of "The Independent," in 1847, in company with Drs. Storrs and Thompson. For sixteen years he was one of the regular working editors, but in 1863 he retired from the active management of this journal, though frequently contributing to its columns. Besides his industrious labors in connection with journalism, Dr. Bacon published a number of books: "Life of Richard Baxter" (1830); "Manual for Young Church Members" (1833); "Thirteen Historical Discourses, on the Completion of Two Hundred Years from the Beginning of the First Church in New Haven" (1839); "Slavery discussed in Occasional Essays from 1833 to 1838" (1846); "Christian Self-Culture" (1863); "Introductory Essay" to Conybeare and Howson's *St. Paul* (1868); and a large number of addresses, etc., before colleges, which have been separately published. Dr. Bacon was an admirable type of the American Congregationalist in both theory and practice. He was a man thoroughly in earnest, and entirely settled and certain in his convictions. Consequently, he was at times rather dogmatic, and very severe upon his opponents, especially "prelatical" folks, whether Episcopal or Presbyterian. There was an inherent love of polemics in him, and he enjoyed hugely the giving some people a

good hammering with his pen. Few topics escaped his attention, and he took an active interest in political and social questions, quite as much so, in fact, as in those usually considered to belong to the ministerial profession. This was shown in his opposition to the early abolitionists of the Lloyd Garrison type, his earnest advocacy of the colonization scheme, his joining the Free-Soil party, his strong siding with the Union cause when secession became decided, his vigorous support of the movement which secured the repeal of the "omnibus clause" of the Connecticut divorce law, etc. Leonard Bacon will hold an honorable place in the records of the nineteenth century, and it may be doubted if there be any one in the Congregationalist body who can adequately supply his loss.

BAGLEY, JOHN J., ex-Governor of Michigan, died in San Francisco, California, July 27, 1881, having gone to the Pacific coast in pursuit of health. He was born in Medina, Orleans County, New York, July 24, 1832, his father being a native of New Hampshire and his mother of Connecticut. His school education was obtained at Lockport, New York. At the age of thirteen he went with his father to Michigan, settling at Constantine, in St. Joseph County, where for a brief period his time was divided between a clerkship in a village store and farm-work. At the age of fifteen he found his way to Detroit, and secured employment in a tobacco-factory, and when twenty-one years old engaged in the same line of business for himself, continuing therein, either as sole proprietor, partner, or stockholder, until his death, accumulating a large property. He was also largely interested in other manufacturing corporations, and for some years was vice-president of a national bank. He served Detroit as a member of the Board of Education, as alderman, and as a member and president of the Board of Police Commissioners. In 1868-'69 he was chairman of the Republican State Central Committee, gaining great credit in conducting the campaign of the former year. In 1872 he was nominated as the Republican candidate for Governor, and was elected by a large majority, running ahead of the Grant electors. He was re-elected in 1874. During his administration he was the firm friend of the charitable and educational institutions of the State, and urged legislation for the promotion of their interests—which he regarded as the interests of the State—while his words of official commendation were supplemented by liberal contributions, especially to the university and to the State Public School for Dependent Children. To his recommendation as Governor the State owes the change in its method of dealing with the liquor-traffic—from a dead-letter constitutional and statutory prohibition to effective taxation and restraining legislation. In January, 1881, he was a candidate for United States Senator for the term commencing March 4th, but was defeated in the Republican legislative

caucus by a single vote. In 1855 he was married to Frances E. Newberry, daughter of a pioneer missionary, who, with six children, survives him. Governor Bagley was a liberalist in religion, and was actively identified with the Unitarian Church at Detroit.

BANK SHARES, NATIONAL, SALE AND TAXATION OF. A provision of the National Banking Act makes it unlawful for a national banking association to loan money upon, purchase, or acquire its own stock, except to prevent loss on a debt previously contracted. A shareholder, who has parted with his shares to the bank, can in the event of subsequent insolvency be proceeded against the same as the other shareholders. The question whether an innocent person who has sold his shares, without suspicion that the bank was the purchaser, is held under that clause of the law, was before the courts for two years, and was finally decided by the Supreme Court at Washington in May. One Laflin sold shares of the National Bank of Missouri to a broker, to whom he delivered the certificate with a transfer power signed in blank, as is customary in stock-sales. The broker was the agent of the president of the bank, who received the certificate and paid for it with his individual check. He was acting for the bank, and the shares were entered on the books in the name of a clerk, and paid for out of the bank's funds. Two months later the bank failed. The receiver applied to the court to have the sale declared void. It was argued that, notwithstanding the good faith of the seller, the transfer was void because there was no legal purchaser, and also that as shareholder he had constructive notice of the bank's part of the transaction and of its insolvency. Justice Field's opinion states that the same rules hold in the case of national-bank shares which govern the sales of other corporation stocks. The delivery of the stock certificate, with blank transfer power indorsed, and the receipt of the price, completed the sale. The transfer on the books was not needful for passing the title. The validity of the sale, without the fraudulent complicity of the seller, was not affected by the subsequent illegal transaction.

A number of Federal court decisions have been made relative to the State taxation of national-bank shares which favor the State side of the question. In the German National Bank *vs.* Kimball, in Illinois, the Supreme Court refused an injunction against the tax, ruling that the person who wishes to resist a tax as unequal, must first tender so much of the tax as is just. In the same State a suit was brought in the Circuit Court, complaining of the law of 1880 under which the assessments were made as granting exemptions to stockholders of corporations other than banks. The court held that it was not the true effect of the law to discriminate against bank-shares. In Ohio the Circuit Court ruled that compulsory process may be issued by the State courts, requiring the officers to make an exhibit of the accounts

of the bank, in order that the tax-officers may assess the deposits.

BAPTISTS. The "American Baptist Year-Book" gives a summary of the regular Baptist churches of the world, of which the following are the totals for the several continents:

CONTINENTS.	Associations.	Churches.	Ordained Ministers.	Members.
North America.....	1,152	26,945	17,168	2,383,632

I. REGULAR BAPTISTS IN THE UNITED STATES.

—The statistics of the regular Baptist churches in the United States, as given by the "American Baptist Year-Book" for 1881, will be found in the table at the head of the next column.

The number of additions during the year by baptism were 102,724; number of Sunday-schools, 13,492, with 116,355 officers and teachers, and 926,979 scholars. Total amount of benevolent contributions, \$4,389,752.

The "Year-Book" gives lists of seven theological institutions, with 37 instructors and 430 students for the ministry; thirty-one colleges and universities, with 280 instructors and 4,609 students; forty-eight academies, seminaries, institutes, and female colleges, with 350 instructors and 5,522 students in the United States; and sixty-eight weekly, semi-monthly, monthly, and quarterly periodicals in the United States and Canada.

The anniversaries of the Northern Baptist societies of the United States were held at Indianapolis, Indiana, beginning with the meeting of the *American Baptist Publication Society*, May 19th. The receipts of this society for the year had been \$326,820 in the business department and \$94,317 in the missionary department, making a total of \$421,137, and showing an increase in both departments of \$71,573 over the receipts of the previous year. Fifty-seven new publications had been issued during the year, making the present number of publications on the society's cata-

logue 1,326. Arrangements were in progress for the preparation of a series of commentaries on the New Testament under the supervision of Professor Alvah Hovey, D. D., of Newton Theological Seminary. In the missionary department, thirty-seven colporteurs and thirty-two State Sunday-school missionaries had been at work in forty-three States and Territories. Increased attention had been paid to the circulation of the Scriptures, of which 13,481 copies had been given away and many thousand copies sold. The German Baptist Publication House employed, with the aid of the National Bible Society of Scotland, twenty-two colporteurs, and had circulated 37,000 Bibles and Testaments, besides large quantities of tracts and other publications in Germany. A Sunday-school Institute was held in connection with the anniversary of the society, at which efforts were resolved upon for establishing Sunday-schools among the colored people of the Baptist churches.

The forty-ninth annual meeting of the *American Baptist Home Mission Society* was held May 24th. The total amount of the receipts for the year had been \$235,032, or \$69,580 more than had been received in the previous

year. The sum of \$33,160 had been added to the trust and endowment funds, and \$12,245 to funds on which annuities were paid. The operations of the society had been enlarged, particularly in the West, and 392 missionaries had been sustained, being 111 more than were employed in the previous year. Of these missionaries, 209 had labored among Americans, 40 among Germans, 30 among Scandinavians, 6 among French, 11 among Indians, 21 among freedmen, and 3 among Chinese. Eleven schools had been sustained, which employed 63 teachers and were attended by 1,649 scholars. Twelve hundred and two churches and out-stations, having 16,279 members, had been supplied, 61 churches organized, and 554 Sunday-schools, with an attendance of 29,090, cared for by the missionaries. The number of schools among the freedmen had been increased, by the addition of the schools at Selma, Alabama, and Live Oak, Florida, to ten. Among their students, 367 had the ministry in view. The students had paid a larger sum for tuition than ever before; and the freed people had contributed for the purposes of the schools \$2,000 in Alabama, nearly \$1,000 in South Carolina, \$400 in Florida, and \$2,000 in Texas and the Southwest; and they were raising funds in Georgia for the erection of a building at Atlanta for the education of young women. An institution was to be established at Marshall, Texas, to be known as "Bishop College." The "Indian University" at Tahlequah, Indian Territory, which had been opened about a year before, had been attended by fifty-seven students, five of whom were studying for the ministry. The establishment of a school at Ogden, Utah, as a means for acquiring influence among the Mormons, was recommended. Preparations had been made to resume the work of the society in Mexico, which, first begun in 1869, had been suspended in 1876.

The anniversary of the *American Baptist Missionary Union* was held May 21st, the Rev. George D. Boardman, D. D., presiding. The total receipts of the society for the year had been \$313,774, of which \$24,971 were for invested funds, leaving \$288,803 applicable to its general purposes. The appropriations had amounted to \$300,653, so that the accounts showed a deficit of \$11,850. The condition of the several missions is exhibited in the following table:

MISSIONS.	Mission-aries.	Native preachers.	Churches.	Members.
Burmah.....	92	447	432	21,963

Greece.....	..	1	1	7
Total.....	170	1,106	1,005	89,272

Total number of persons baptized during the year, 9,143. Reports were made concerning editions of the Bible and the New Testament in Burman, Karen, Shan, Telinga, the Garos language, Japanese, and the colloquial dialect of Swatow, China.

Recommendations were adopted that it should be made an object to place the Bible in the hands of every Christian family in the missions any of whose members can read or can be easily taught to read, and the New Testament in the hands of children in the Sunday and day schools; to encourage the circulation of the Bible among nominal Christians who can read, with special efforts to induce them to read it, while taking care at the same time not to place the book in the hands of those who will wantonly destroy it.

The *Southern Baptist Convention* met at Columbus, Mississippi, May 5th. The Rev. P. H. Mell, D. D., was chosen president. The Foreign Mission Board reported that its receipts had been \$46,820, and that the debt of the previous year had been paid. An application had been made for the appointment of missionaries to Cuba, and the Secretary of State of the United States had been asked whether such missionaries would be protected and tolerated. The Secretary had replied that they would be protected as citizens, but that no assurance could be given in advance as to the action of foreign authorities toward the missionaries themselves or in respect to their work. The reports of the condition of the several missions may be summarized as follows: *Mexico*: Thirteen churches had been organized, of which five had been afterward disbanded, leaving eight churches, with 200 members. The missionary, Rev. J. O. Westrup, had been murdered in December, 1880, and a successor to him was to be appointed. *Brazil*: Three missionaries, 22 members. *China* (Tung Chow, Shanghai, and Canton): 12 missionaries, 18 native assistants, 543 members, 190 pupils. *Italy*: Four foreign missionaries, 10 native evangelists, 11 stations, 175 members. Efforts had been made to secure the co-operation of the colored Baptists of all the States in prosecuting African missions, but with only partial success. The Home Mission Board had received and expended \$27,869. A church with ten members had been organized in San Francisco, California, in connection with the Chinese mission at that place. Buildings had been erected for the Levering Indian Institute in the Creek nation, and the school would be opened in the fall. The missionaries of the board had labored in eight States, where their work was supplemented by that of the missionaries of the State Conventions. They had themselves supplied 59 churches and 48 other stations. Three hundred and fifty women's societies had collected \$6,000 for the purposes of the convention.

A Missionary Convention of Colored Baptists of the South was held at Montgomery, Alabama, in the last days of 1880, and organized the *Baptist Foreign Missionary Convention of the United States*, the object of which was declared to be to give the Gospel to the people of Africa and elsewhere through missionary and educational work. A scheme for home missionary work was also devised. The convention was attended by delegates from Arkansas, Alabama, Florida, Georgia, Louisiana, Mississippi, Ohio, Tennessee, Texas, and Virginia.

II. SEVENTH-DAY BAPTISTS.—The sixty-seventh annual meeting of the *Seventh-Day Baptist General Conference* was held at Farina, Illinois, beginning September 21st. Joshua Clarke presided. Two new churches were admitted to membership in the conference, and a third church had been partly organized. A small increase was reported in the number of members of the church. The number added by baptism had been greater than in any previous year for a long time past, and the additions by letter had exceeded the dismissions, but the number of exclusions had been unusually large. The number of Sabbath-schools was 94, with 6,913 persons attending them as officers, teachers, and scholars. A committee which had been appointed to co-operate with the friends of civil liberty in Pennsylvania for the exemption of Sabbath-keepers from the penalties of the Sunday laws of that State, made a report of its work. It had solicited essays in support of its efforts from men of several denominations and from professional men, and had secured many expressions of sympathy, but had not succeeded in getting any formal papers prepared on the subject; and it had obtained a large number of signatures to petitions. A few persons declined to give their support to the movement because it did not go as far as they would have it, in that it did not seek the unconditional repeal of the Sunday law. A bill to protect "religious liberty" was introduced in the Legislature of Pennsylvania by Mr. H. Gates Jones, and was supported by public meetings and addresses prompted by the committee, but was opposed by persons who were unwilling to tolerate any relaxation of the Sunday laws of the State; and it failed to pass in the Senate by lacking one vote of receiving a constitutional majority, although twenty-five votes were cast in its favor to fifteen against it. The Committee on Denominational History reported that a complete history was in course of preparation.

The *Seventh-Day Baptist Missionary Society*, whose anniversary was held in connection with the General Conference, had sustained home and foreign missions. The home missions returned 20 missionaries and missionary pastors laboring in 11 States, with 29 churches and 43 other preaching stations supplied, 26 Bible-schools, and 212 "Sabbath-keeping" families. The foreign mission is at Shanghai, Chi-

na, and returned one missionary and his wife and one missionary teacher, two native preachers, one Bible woman, one Sabbath-school and two day-schools, a church of about twenty members, and missionary buildings valued at \$7,400. The subject of extending missionary work in Holland beyond the bounds of the church at Haarlem was under consideration.

III. OLD OR GENERAL BAPTISTS OF RHODE ISLAND.—The two hundred and eleventh anniversary of the Old or General Baptists of Rhode Island was held in Coventry, September 7th, 8th, and 9th. The Rev. J. Porter was moderator. The body consists of twelve churches, containing in all about 1,200 members. The churches reported no special revivals, "but fair interest and general 'steadfastness.'"

IV. THE BRETHREN, OR TUNKERS.—The Brethren are represented in twenty States. Their churches return 1,578 ministers, 306 of whom are in Pennsylvania, 248 in Indiana, 227 in Ohio, 142 in Illinois, and 133 in Iowa.

The regular *Annual Meeting* of the Brethren, or Tunkers, was held at Ashland, Ohio, in June. As in former years, much of the time of the meeting was spent in answering queries from district meetings in regard to the mode of dress. It was decided that a church letter ought not to be given to a member who does not dress in the uniform of the church; that only those who conform to the order of dress be appointed on committees to settle difficulties arising on this subject; that those only who dress themselves and wear their hair according to the regulations should be appointed delegates to the annual meeting, in which such only are permitted to speak; that sisters may wear coats of a certain pattern (formerly prohibited), and that they ought not to wear hats. One of the journals of the denomination noticed as signs of the advances which the Brethren were gradually making toward conformity with modern ideas, that the meeting was held in the "Campus" and "under the very shadow of a Brethren's College," and that the standing committee held its sessions in one of the recitation-rooms of the college, "in which there stood at the self-same time a musical instrument—even a forte-piano"; also that a collection was taken for the building of a meeting-house and parsonage in Denmark, a thing that would not have been tolerated on the grounds of the annual meeting sixteen years before. These movements toward conformity with the world have resulted in the formation of three parties among the Brethren: the "Progressives"; those who contend for the old order; and those who occupy a middle position, and deprecate, on the one hand, departures from the established order of the Brethren, and, on the other hand, intolerance of differences and too rigid adherence to unessential matters.

A convention of Old-Order Brethren held in Maryland adopted a protest against the course

of the annual meeting in tolerating "grave departures from ancient principles," and a platform of principles, among which were declarations in favor of baptism by trine immersion, "both administrator and candidate going into the stream, accompanied by the laying on of hands and prayer in the water, there being no gospel for baptizing either sick or well persons in a mechanical vessel, in a house or outside"; feet-washing by the double mode; the Lord's Supper a full meal; sisters to have their heads covered with the plain white cap, brethren to have their heads uncovered in time of praying or prophesying; "plainness in all things by all, and uniformity in non-conformity to the world; . . . colleges and high-schools, being of the world, belong not to the church, nor to the humble followers of Christ"; Sunday-schools not of Gospel authority; "taxation for missionary purposes unscriptural; salaried or paid ministry unscriptural, as understood by our ancient brethren; special educational preparation for the ministry not according to the Gospel, as understood by our ancient brethren"; no life insurance; no oath-bound or secret orders; non-resistance; non-swearing; brethren not to be permitted to engage in political affairs by voting and holding oath-bound offices under the civil laws. The several churches and meetings have been considerably agitated in consequence of these differences.

V. BAPTISTS OF THE MARITIME PROVINCES.—The thirty-sixth annual convention of the *Baptists of the Maritime Provinces* met at Yarmouth, Nova Scotia, August 20th, and was attended by an unusual number of delegates. F. H. Rand, LL. D., was chosen president. The statistical reports showed that 1,260 persons had been baptized during the year. The convention sustained three foreign mission stations in the Telooquo country of India, at which eight converts had been baptized since the previous year's report. The income of the Board of Missions had been \$5,400, and its expenditures \$6,150. The Board of Home Missions had employed 48 missionaries, who supplied 86 churches and 206 out-stations at an outlay of \$5,204. The "convention scheme" of finance, which contemplates the raising for benevolent purposes of a sum equivalent to a dollar a person for the entire membership of the churches, had been nearly successful.

VI. PARTICULAR BAPTISTS IN GREAT BRITAIN AND IRELAND.—The annual meetings in connection with the *Baptist Union of England and Ireland* were held in London in April, beginning on the 26th. The Rev. Henry Dowson was chosen president of the Union for the year. The financial reports showed that the number of churches and of single members contributing to the funds of the Union had considerably increased. A resolution on public affairs was adopted expressing satisfaction with the domestic and foreign policy of the Government, the belief that it would persevere in its determina-

tion to do what is just and right, and the assurance that if it pursued that course it would have the support of the masses of the people. A petition to Parliament was adopted in favor of the suppression of the opium-trade. A petition coming from members of the Universities of Oxford and Cambridge asking that the Baptist Union, in connection with the Congregational Union, would arrange for the delivery of lectures or sermons in the university towns on the principles of non-conformity, was referred to a committee.

The managers of the Baptist Building Fund had granted thirty-five loans, amounting to £8,032, and reported twenty-two new chapels opened and six chapels enlarged and improved. The receipts of the Bible Translation Society had been £2,392. The invested capital of the Baptist Annuity Fund had been increased to £78,000.

The Union met in its autumnal session at Portsmouth, October 26th, and was opened by President Dowson with an address on "Spiritual Life in Connection with the Assemblies and Operations of the Union."

The eighty-ninth annual meeting of the *Baptist Missionary Society* was held in London, April 26th. The receipts of the society had been £51,459, the largest amount of income reported in its history. Of this amount £11,915 had been contributed for special purposes, including £4,000 given by Mr. Arthington, of Leeds, for the Congo mission, and £3,421 which had been given by the churches for the benefit of sufferers by a cyclone in Jamaica. The missions of the society are in India, Ceylon, China, Japan, Africa, the West Indies, and Jamaica, and parts of Europe, and returned 95 missionaries and assistants wholly, and 18 partly, supported by the society, 61 pastors of self-supporting churches, 258 evangelists, 536 stations and sub-stations, 3,373 persons baptized during the year, 38,397 members, 172 teachers, 5,815 day-scholars, and 5,828 Sunday-scholars.

In India, two editions of the New Testament in Bengali (one with references), and one edition in Hindi, had been completed, and a large number of Scriptures and tracts in the Kaithi language had been printed. The revision of the Singhalese New Testament, begun in 1876, had been completed. The thirty-two native churches in Shansi and Shantung were all self-supporting and ministered to by Chinese pastors, and had received a large number of converts. In Western Africa a branch station from Bukundu had been established, nearly a hundred miles in the interior. The missionaries to Central Africa had not yet reached their destination at Stanley Pool, on the Congo, but had labored with effect in San Salvador and the neighboring towns.

VII. GENERAL BAPTISTS IN GREAT BRITAIN.—The one hundred and twelfth annual meeting of the *General Baptist Association* was held at Norwich, June 21st. The Rev. Dawson Burns presided. Reports were received from 154

churches of 1,368 additions by baptism, of a clear increase of 441, and a total of about 26,000 members. The receipts for foreign missions had been £7,766, and the expenditures £8,518.

A "Local Preachers' Conference" was held during the meeting of the association, at which a paper was read on the need of increased and better organized local preachers' work in the churches. The establishment of home-mission centers, to be under the direction of the conference to which they belong, was recommended. In a Sunday-school conference, the establishment of weekly services for children, a union for young converts, and special evangelistic services, were recommended. Numerous services for children of the kind suggested were already held weekly in London, Liverpool, and Paris. The "association letter" on the adaptation of the church to the wants of the times, suggested that such modifications in creed and practice as were made necessary in the light of modern discoveries should be accepted, that a wider policy should be allowed in baptism, and that open fellowship should be permitted. Another "association letter" was read upon the subject of "open fellowship."

BEACONSFIELD, EARL OF. (See DISRAELI, BENJAMIN.)

BELGIUM, a kingdom of Europe. Leopold II, King of the Belgians, born April 9, 1835, is the son of King Leopold I, former Duke of Saxe-Cobourg, and ascended the throne at his death, December 10, 1865. He was married August 22, 1853, to Marie Henriette, daughter of the late Archduke Joseph of Austria (born August 23, 1836), who has borne him three daughters. The heir-apparent to the throne is the brother of the King, Philip, Count of

Flanders, born March 24, 1837, lieutenant-general in the service of Belgium, who was married, April 26, 1867, to Princess Marie of Hohenzollern-Sigmaringen (born November 17, 1845), and has two sons, Baldwin, born July 3, 1869, and Albert, born April 8, 1875. The oldest daughter, Princess Louisa, born February 18, 1858, was married on February 4, 1875, to Prince Philipp, Duke of Saxe-Cobourg and Gotha.

The area of this kingdom is 29,455.16 square kilometres (1 square kilometre = 0.386 square mile) or 11,373 square miles. The population, according to the census of December 31, 1876, was 5,336,189, and in December, 1879, according to a calculation based upon the movement of population, 5,536,654. The following table exhibits the population of each province at the close of 1878:

PROVINCES.	Pop. in Dec., 1879.
Antwerp.....	569,279
Brabant.....	993,596
Flanders, West.....	695,761
" East.....	886,776
Hainault.....	982,402 *
Liège.....	659,803
Limburg.....	211,694
Luxemburg.....	210,553
Namur.....	324,510
Total.....	5,536,654

The population of the principal cities on December 31, 1879, was as follows: Brussels, 170,345; Antwerp, 163,011; Ghent, 132,839; Liège, 121,787; Bruges, 44,833; Malines, 41,328; Verviers, 40,362; Louvain, 35,090; Tournay, 32,832; Courtrai, 27,061; Saint Nicolas, 25,698; Namur, 25,792; Seraing, 25,046; Mons, 24,696; Alost, 21,631.

The movement of population from 1873 to 1879 is shown in the following table:

YEAR.	Marriages.	Births, Deaths,		Still-born chil- dren.	Surplus of births.	Total population on December 31.
		Inclusive of still-born.				
1873.....	40,598	173,491	120,656	7,783	57,835	5,253,821
1874.....	40,323	131,723	117,845	7,550	64,383	5,396,634
1875.....	39,050	183,301	130,229	7,749	53,072	5,403,006
1876.....	38,223	184,845	124,717	7,930	60,123	5,336,185
1877.....	36,962	183,122	122,314	8,045	60,808	5,412,731
1878.....	36,669	180,451	125,462	7,721	47,679	5,476,989
1879.....	37,421	182,743	120,202	8,142	53,631	5,536,654

Of the total births in 1879, 168,724 were legitimate, and 14,059 were illegitimate. The number of divorces amounted to 151.

The number of representatives in the Lower House of the Chambers is 132, the number of senators is 66. In order to be eligible for election to the Chamber of Representatives, it is necessary to be twenty-five years of age, and a citizen of Belgium. On the other hand, no one is eligible to the Senate who does not pay direct taxes to the amount of 1,000 florins (2,116 francs). Under this law there are at present but 507 Belgians eligible to the Senate. The number of persons entitled to vote at general elections was, in 1881, 116,090.

The public debt on August 1, 1880, was as follows:

	Francs.
Two and a half per cent debt.....	219,959,632
Three per cent loans from 1873 to 1878. . .	383,707,100
Four per cent debt (1871 to 1879).....	672,741,882
Four per cent loan of 1880.....	184,719,000
Rentes funded at 3 per cent.....	1,409,635
Rentes funded at 5 per cent.....	7,611,960
Five per cent annuities to the Netherlands.....	2,539,680
Annuities for repurchasing railroads at 4½ per cent.....	818,511,373
Total.....	1,741,200,267

The immigration into Belgium has since 1871 always exceeded the emigration from the country. In 1879, there were 14,234 immigrants and 12,474 emigrants.

The budget for the years 1879 and 1880 estimated receipts and expenditures as follows (in francs):

I. RECEIPTS.		1879.	1880.
1. Direct taxes.....		44,418,000	44,110,000
2. Indirect taxes.....		102,735,500	105,624,500
3. From means of communication (railroads, telegraphs, post, etc.)		108,922,600	110,272,400
4. Miscellaneous.....		10,101,000	10,005,000
5. Reimbursements.....		3,263,160	3,485,160
Total receipts.....		264,435,260	273,497,060
II. EXPENDITURES.			
1. Public debt.....		77,990,229	79,024,246
2. Dotations.....		4,699,475	4,647,475
3. Ministry of Justice.....		15,901,169	16,042,809
4. Ministry of Foreign Affairs.....		2,073,110	2,183,435
5. Ministry of the Interior.....		9,800,278	9,529,883
6. Ministry of Education.....		14,250,599	16,541,122
7. Ministry of Public Works.....		84,250,352	86,682,168
8. Ministry of War.....		44,040,000	44,162,700
Budget of the gendarmery.....		3,410,000	3,483,200
9. Ministry of Finance.....		13,242,110	13,850,010
10. Reimbursements and outstanding debt.....		1,187,000	1,187,000
Total expenditures.....		272,344,817	278,818,548

The special commerce with foreign countries in 1878 was as follows (values in francs):

* COUNTRIES.	Imports.	Exports.
Russia.....	129,685,000	22,935,000
Sweden and Norway.....	28,536,000	6,775,000
Denmark.....	2,241,000	2,293,000
German Customs Union.....	222,108,000	200,025,000
Bremen.....	1,167,000	839,000
Hamburg.....	18,339,000	19,565,000
Netherlands.....	156,937,000	146,147,000
Great Britain.....	194,252,000	249,598,000
France.....	523,161,000	829,355,000
Portugal.....	2,066,000	5,723,000
Spain.....	22,739,000	13,804,000
Italy.....	6,247,000	13,109,000
Switzerland.....	999,000	19,152,000
Austria.....	1,400,000	2,945,000
Turkey.....	12,166,000	5,068,000
Africa.....	3,598,000	8,965,000
Asia.....	10,747,000	5,725,000
United States.....	175,567,000	9,307,000
Cuba and Porto Rico.....	1,921,000	5,942,000
Hayti and Venezuela.....	4,844,000
Brazil.....	20,969,000	23,610,000
Uruguay.....	15,572,000	898,000
Rio de la Plata.....	53,989,000	6,989,000
Chili and Peru.....	85,930,000	11,370,000
Other countries.....	1,384,000	2,382,000
Total.....	1,472,764,000	1,112,352,000

The transit trade in the same year amounted to 897,347,000 francs.

The movement of shipping in Belgian ports in 1878 was as follows:

AT ALL PORTS.	No. of vessels.	Tonnage.
Total vessels entered.....	6,505	3,184,747
Total vessels cleared.....	6,326	3,124,796
Steamers entered.....	4,143	2,447,820
Steamers cleared.....	4,119	2,414,463

The length of railways in operation at the close of 1879 was 4,012 kilometres. The length of telegraph-wires was 23,572 kilometres, and of lines 5,410 kilometres. The number of stations was 708, and the total number of dispatches 3,242,615. The number of post-offices was 638; of letters (ordinary, registered, and insured), 69,026,949; of newspapers, 69,712,000; of printed matter, 28,041,000; of postal-cards, 16,720,652; and of official correspondence, 10,841,141.

The Chamber of Deputies, which adjourned December 24, 1880, resumed its sittings on the 25th of January. The conflict between the Church and the Liberals, on the educational question, continued in and out of Parliament. By the gain of a seat by the Clericals, the Liberal majority in the Senate was reduced to four. A parliamentary investigation into the condition of schools and the character of the instruction imparted excited the indignation of the Clericals, who appealed to the article of the Constitution which leaves it free to any one to open a school and receive pupils. The purpose of the investigation was to show by the testimony of experienced pedagogues and school-inspectors, whose judgment would have weight in the country, that the schools which had been hastily established everywhere by the clergy to compete with the state schools, were taught by incompetent and ignorant persons. The majority in Parliament were moved, by the obstructions cast by the Church party in the way of the new system of education, to take reprisals in the form of a reduction of the budget of Public Worship.

The Minister of Justice, by request, laid before the Chamber of Deputies a statement of the amount of the stipends paid to the clergy as compared with 1832. There are 4,997 of the lower clergy, whose salaries amount to 4,384,937 francs, against 2,335,795 for 3,870 stipendiaries fifty years ago. The lower clergy consists of 91 parish priests of the first and 140 of the second class, 2,804 curates, 179 chaplains, 1,667 vicars, and seven coadjutors, with ten chaplaincies and ninety-nine vicarships unfilled. The higher clergy and seminaries draw from the state 321,000 francs against 235,232 in 1832.

In the discussion upon the proposed revision of the annual fund for ecclesiastical maintenance, Minister Bara laid down the principle that the granting of the budget for Public Worship was purely a state act, to be determined from motives of public policy, and that it was based upon no convention between the Church and the state. Jacobs, the Clerical champion, argued on the contrary that the budget was a poor and inadequate indemnity repaid to the Church for the property of which it was robbed in the Revolution. The Government refrained from retaliating the hostilities of the clergy by cutting down the salaries of the bishops and the parochial clergy. A motion of the Radicals to do this was voted down by 95 to 26 majority. In the budget, which was voted in March, a large aggregate reduction was effected by abolishing chaplaincies, suppressing the pay of supernumerary assistant clergy, and withholding the annual grants to the ecclesiastical seminaries. The last retrenchment was justified on the ground that these institutions have abundant revenues of their own. Bara announced that the care of souls in the army would devolve upon the parochial clergy. The army he declared to be no more in need of re-

ligious ministers of its own than the judicial bench or the Legislative Chamber. If the parish vicars in the garrison towns refused to extend their spiritual ministrations to the military, their pay would be stopped. A provision in the budget cuts off the salary or stipend attached to any place in which a foreign priest officiates who has not received the permission of the Government.

The Government declared, in response to an interpellation, in May, that no overtures had been made by the Vatican toward the reopening of diplomatic relations. During King Leopold's visit to Vienna, on the occasion of his daughter's wedding, he met the former nuncio, Vanutelli, in the presence of his cabinet-chief, Frère-Orban, but was not approached on the subject of resuming diplomatic intercourse.

An angry controversy broke out among the Clericals between the extreme Ultramontanes, represented by Professor Périn, of Louvain, and the moderate portion. The former held persistently to the doctrine advanced in the Syllabus of Pius IX, and would not acknowledge the secularized Belgium, in which the therein defined relations to the Church were disregarded, to be a legitimately constituted state. The Clerical representatives in Parliament were bitterly assailed for accepting the new order of things and seeking a *modus vivendi* with the state. This contest called forth a reproof from Pope Leo, who significantly admonished the Catholics of Belgium that the Church, while maintaining unalloyed its holy teachings and principles of jurisprudence, preserves always a "discreet attitude," has "due regard for the right mode suited to the time and place," and often finds itself obliged "to submit to evils which it finds it almost impossible to prevent without exposing itself to still worse evils and complications." The bishops felt impelled by the Pope's letter to remove Périn, the pragmatist upholder of the Syllabus, from the chair of Civil Law in the University of Louvain.

A law has been made providing that the glebe-lands shall be administered in the same manner as the other state demesnes, and may also be alienated by the Government. Clergy who have received the revenues of the church estates are to be paid entirely out of the public treasury. The vicar Yserbyt, and villagers of Heule, near Courtrai, who created a disturbance in the latter part of 1880, were sentenced to prison.

President Guillery, of the House of Deputies, was overruled by the vote of his own party on a question of order, March 10th, and conceiving the action of the House to be an infraction of his authority, he resigned. A member of the Right had stated that the army had resented partisan orders of the War Minister. The president accepted as sufficient a declaration of the member, Woeste, that he would retract the words, but still held to the opinions; but the House demanded a completer apology for the

insult to the army. The Deputies elected in Guillery's place Descamps, the first vice-president.

The Government carried a measure for the reorganization of secondary schools. A proposal brought forward by the advanced Liberals to abolish religious instruction in the middle-class schools was not accepted by the Government, and was defeated in the Chamber. The motion was to rescind the provision of the law of 1850, according to which the clergy are invited to impart religious instruction in secondary schools, and leave religious teaching to the families of pupils.

The Government has established 12 additional colleges and 100 intermediate schools, 56 for boys and 44 for girls.

The election registry for 1881 contains about 9,000 names less than in 1879, the number of voters in a total population of 5,536,654 souls being 116,090. A large number of names were dropped from the lists in 1880, and an additional number in 1881, on the ground that the omitted persons did not pay the amount of taxes which legally qualifies them for the franchise. They were mostly peasants and men in holy orders. At the rate of progression which took place anterior to this strict construction of the law, the number of voters would be 131,000 or over. The lists of communal electors have, by a like rigorous application of the election laws, been reduced from 384,549 names in 1879 to 373,666 in 1881. The fees for naturalization have been reduced by Parliament from 1,000 and 5,000 francs for the two grades, to half those amounts.

In the summer an agitation was commenced in favor of universal suffrage, or for the establishment of an educational instead of the tax qualification. Mass-meetings were held in Brussels, Antwerp, and elsewhere. The Radical, Janson, demanded in the Chamber that the Government show its colors on this question. For communal and provincial elections to begin with, the abolition of the limitation or the substitution of an intellectual test was asked for. The Minister of Finance replied that the question was not yet ripe, that the Constitution prescribed the *cense*, and that if the matter were carried before the country the Liberal party would be divided and the Clerical opposition would succeed to the helm. The subject was brought forward again when a law relating to the provincial assemblies was under consideration. The Prime Minister proposed to defer Janson's proposition, to which the mover agreed; but the seconder, Dufuisseaux, deserted by his friends, felt called upon to resign his seat. An extension of the franchise would benefit the Clerical and Social-Democratic parties; for which reason the Liberal ministry, though not opposed to the reform, will not take the step without cautiously measuring the effects. The elections of delegates to the municipal councils in October resulted in a marked victory for the Liberals.

Stéphanie, daughter of the King of the Belgians, was married, May 10th, to the Crown-Prince Rudolph of Austria. (See AUSTRIA.)

The Minister-President, Bounder de Malsbroek, was transferred in January from Copenhagen and Stockholm to Washington.

The German commercial treaty of 1865 was renewed, and is to continue in force until one year after one of the contracting powers has given notice of dissolving it.

Count Auguste Van der Straeten-Ponthoz was transferred from his post at the Hague to succeed the venerable Baron Nothomb (see OBITUARIES) at Berlin. Baron d'Aethan, former Belgian representative at the Vatican, was appointed minister to the Hague.

The latest law for military organization provides for an army of 46,277 men, including all officers, police, and non-combatants, with 10,014 horses and 204 guns, in time of peace; and for a war force, of 103,683 men, not counting officers, gendarmery, etc., with 13,800 horses and 240 guns. The army comprises 18 line regiments of infantry, with 3 line and 1 reserve battalion each, and 1 rifle regiment with 4 line and 2 reserve battalions, every battalion consisting of 4 companies, and the company of 100 men in peace and 225 in war, exclusive of officers. The cavalry consists of 8 regiments, of 4 line and 1 reserve squadron each, the squadron having 120 horses in time of peace and 154 in war. The field-artillery consists of 2 regiments with and 2 without mounted batteries, each regiment containing 10 batteries of 6 guns, with 94 men and 64 horses in time of peace and 155 men and 152 horses on a war-footing. There are 3 regiments of standing artillery of 18 batteries, each battery being manned with 78 men in peace and 176 in war; 1 engineer regiment of 3 battalions with 10 companies each, 85 men strong in peace and 300 strong in war. The Belgian Citizens' Guard, or militia, has 120,000 men enrolled, of which 30,000 are active. The King, in an address on the occasion of the opening of the new dock at Ghent, declared that the secure establishment of national military defenses ought to keep even pace with the advancement in material prosperity, referring to the development of a strong military reserve, which has been the aim of the Belgian Government for many years.

BI-METALLIC STANDARD. The International Monetary Congress, which was held in connection with the Paris Exposition of 1878, having produced no practical result, the Government of France endeavored during the two years following to initiate a movement for bringing the nations together for some more formal action. France and other members of the Latin Union still maintained the double, or bi-metallic, monetary standard; Great Britain persisted in the single gold standard, except for India, where silver constituted the currency; Germany, having recently adopted the gold standard, continued to dispose of her

surplus stock of silver; and the United States, which had resumed the coinage of legal-tender silver dollars, was apprehensive of derangement of her financial system by a further decline in the value of silver. France and the United States were disposed to adhere to bi-metallicism, but it was generally recognized that some broader international agreement was necessary in order to maintain the relative value of the metals and give it stability. Great Britain showed no disposition to yield its single-standard policy, but was interested in sustaining the value of silver on account of its extensive use as currency in her Eastern colonies. Germany had given no evidence of a desire to recede from its action of 1873, but was apparently willing to discuss the subject, and to submit her sales of silver to restrictions. Austria was inclined to a cautious policy, dependent on the future action of Germany and Great Britain.

An effort was made in 1880 by France to secure a monetary conference at Paris in November of that year. This effort failed, but the co-operation of the United States was obtained, and on the 8th of February the Foreign Secretary was able to announce, in a council of ministers, that the Government of the United States had agreed to the proposition of France for an International Monetary Conference to consider the question of a more general adoption of the double standard of gold and silver. Invitations would be addressed to the other powers, and the question then was whether it should be in the name of France alone or France and the United States jointly. Subsequently, early in March, a joint note of the two Governments was addressed in identical terms to their ministers in other countries, to be by them communicated to the several governments to which they were accredited. The note was as follows:

The Government of the Republic of France and the Government of the United States, having exchanged views upon the subject of a conference between the powers principally interested in the question of establishing internationally the use of gold and silver as bi-metallic money and securing fixity of relative value between those metals, and finding themselves in accord as to the usefulness and importance of such a conference, and as to the time and place at which the same should be held, have the honor now to invite the Governments of — to take part in a conference by such delegates as each government may appoint, to be held at Paris on Tuesday, the 19th of April next, to consider and adopt for presentation to the governments so represented for their acceptance a plan and system for the establishment by international convention of the use of gold and silver as bi-metallic money at a fixed relative value between those two metals.

Messrs. William M. Evarts, Allen G. Thurman, and Timothy O. Howe were promptly appointed as delegates on behalf of the United States, and Mr. S. Dana Horton was subsequently added. The French Government appointed M. Magnin, the Minister of Finance; M. Dumas, Secretary of the Academy of Sciences, and President of the Mint Commission;

M. Denomandie, Senator and head of the Bank of France; and M. Cernuschi, the well-known advocate of the bi-metallic standard. Germany accepted the invitation, with the reservation that it would not be bound by any decisions of the conference, and selected Baron Thielmann as its delegate. Austro-Hungary named three delegates: Count Kuefstein, Counselor of Legation; Ministerial Counselor Nibauer; and Herr Hegudus, of the Reichsrath. Their instructions indicated a leaning toward bi-metalism, but practically required them to hold a neutral position. There was much discussion in Great Britain regarding the propriety of sending representatives. There were memorials in favor of appointing delegates addressed to the Government by the Liverpool Chamber of Commerce, the merchants and bankers of London, and some others, and remonstrances against it from Manchester and other quarters. The Government assumed that the terms of the invitation were such that it could not be accepted without committing those participating in the conference to a support of its conclusions. On the 7th of April Sir Charles Dilke, in the House of Commons, stated that England could not consent to discuss the principle of bi-metalism, and had declined to take part in the conference; but the Indian Government would send a delegate, who would not, however, participate in the discussion. The other colonies might also be represented.

When the conference met, on the 19th of April, fourteen governments were represented; viz., those of France, the United States, Germany, Austro-Hungary, Italy, Spain, Portugal, Holland, Belgium, Russia, Norway and Sweden, Denmark, Switzerland, and Greece. Several of them had but one delegate. Sir Louis Mallet and Lord Reay, the delegates for India, had not arrived, and it was understood that Sir A. T. Galt would appear in the interest of Canada, and that Mr. C. W. Fremantle, deputy-master of the British Mint, would be present during some part of the proceedings. The delegates were welcomed by M. Barthélemy St.-Hilaire, the French Minister of Foreign Affairs, who said that the object of the conference was to establish a normal monetary standard instead of the shattered equilibrium of the past, and to consider the best means for preventing a recurrence of the disastrous crises. He concluded by declaring that, if the conference did not achieve immediate success, it would, at least, have raised controversies which are indispensable to the discovery of truth, and established principles which will bear fruit in the future. On motion of Mr. Evarts, delegate from the United States, M. Magnin, French Minister of Finances, was elected president of the conference. M. Magnin reviewed the different phases of the question, and showed the inconveniences which the system established in 1867 of a gold standard, with silver as a transitory companion, had brought about in Germany.

He dwelt on the recommendation in favor of bi-metalism by the committee of the United States Congress in 1876. He explained the causes of the non-success of the Monetary Conference in 1878. As regarded the objects of the present conference, it was indispensable, in order that silver shall regain its former value, that it should again be freely coined side by side with gold. A committee of fifteen, one for each state represented, was appointed to draw up and report a list of questions to be considered. Dr. J. C. Kern, of Switzerland, was made president of the committee as the senior member, and Herr Vrolik, of Holland, was chosen to act as chairman at its sittings. There were several meetings of the conference and of the committees prior to May 5th, when the following questions, prepared by the Dutch delegate, M. Vrolik, were submitted as the report of the committee:

1. Have the diminution and great oscillations in the value of silver, which have occurred especially in late years, been injurious to commerce and consequently to the general prosperity? Is it desirable for the ratio of value between the two metals to have a great fixity?
2. Are the phenomena indicated in the first part of the foregoing question to be attributed to the increase in the production of silver or to legislative measures?
3. Is it probable or not that if a large group of states accords free and unlimited coinage of legal pieces of both metals, having full paying power in a uniform proportion for the gold and silver contained in the monetary unit of each metal, a stability, if not absolute, at least very substantial, will be obtained in the relative value of those metals?
4. In case the preceding question is answered affirmatively, what measures should be taken for reducing to a minimum the oscillations in the ratio of value between the two metals? For instance, would it be desirable to impose on chartered banks of issue the obligation of always accepting at a fixed price ingots of gold and silver offered them by the public? Could the public be insured the same privileges in countries where there is no chartered bank of issue? Should the mintage be gratuitous, or at least uniform, in all countries for the two metals? Should there be an understanding to leave free of all obstruction international commerce in the preceding metals?
5. In adopting bi-metalism, what should be the ratio between the weight of pure gold and silver contained in the monetary units?

After this programme had been submitted to the conference, Baron Thielmann made the following statement on behalf of the German Government: "We admit unreservedly that a rehabilitation of silver is to be desired, and that it might be realized by the establishment of the free coinage of silver in a certain number of the most populous states represented in this conference, which, with that view, would adopt as a basis a fixed ratio between gold and silver. Nevertheless, Germany, whose monetary reform is so far advanced, and whose general monetary situation does not seem to demand so radical a change of system, does not see that it is possible to consent, so far as she is concerned, to the free coinage of silver. Her delegates can not, therefore, subscribe to such a proposal. The Imperial Government is, however, quite disposed to second, so far as it is able, the efforts of other powers, which might

be disposed to unite to bring about a rehabilitation of silver by means of the free coinage of that metal. For that purpose, and to guarantee those powers against the influx of German silver, which they appear to apprehend, the Imperial Government would impose on itself the following restrictions: During a period of some years it would abstain from all sales of silver, and during another period of a certain duration it would engage to sell annually only a limited quantity, so small that the general market would not be encumbered by it. The duration of those periods, and the quantity of silver to be sold annually during the second, would form the subject of subsequent negotiations."

The delegates for India, who appeared at this stage of the proceedings, acted under the following instructions: "You will explain that, in sending a delegate to the conference, the Government of India must not be held to commit itself to the adoption of the principle of the bi-metallic system in India, and that you are not authorized, without further instructions, to vote on any question raised at the conference. You will, however, add that, while the Secretary of State in Council is unwilling to encourage an expectation of any material change at present in the monetary policy of India, he would be ready to consider any measures which might be suggested for adoption in India as being calculated to promote the re-establishment of the value of silver. It is desirable that you should, so far as possible, avoid giving any pledge on the part of the Government of India which would in any manner interfere with its future liberty of action; but in the event of your being pressed on the subject, or your seeing reason to think it desirable that such a declaration should be made, you are authorized to agree, on the part of the Government of India, that for some definite term of years, not exceeding ten, it will undertake not to depart in any direction calculated to lower the value of silver, from the existing practice of coining silver freely in the Indian mints as legal tender throughout the Indian dominions of her Majesty. Such a declaration must, however, be conditional on the acceptance by a number of the principal states of an agreement binding them, in some manner or other, to open their mints for a similar time to the coinage of silver as full legal tender in the proportion of $15\frac{1}{2}$ of silver to 1 of gold, and the engagement on the part of India would be obligatory only so long as that agreement remained in force."

Mr. Fremantle and Sir A. T. Galt, as well as Sir L. Mallet and Lord Reay, were present after the plenary sitting of May 5th, but stated that the English Government was thus represented out of deference to the inviting powers, and that its delegates, while willing to furnish information, would not vote on any proposition. The discussions were kept up from time to time until May 19th, representa-

tives of various governments explaining their position. The German delegate stated that Germany adhered to the single gold standard, but was prepared to suspend its sales of silver, and might increase the number of marks in circulation, and possibly increase the amount of silver per mark, and withdraw the five-mark gold-piece. The delegates of Russia, Norway and Sweden, Switzerland, and Greece, spoke with reservation in regard to the acceptance of the bi-metallic standard. The Spanish delegate proposed an adjournment, to secure fuller instructions, and reserved entire freedom of action. On the 7th of May Mr. Pierson, of Holland, made a speech advocating bi-metallism, and M. Pirmez, of Belgium, replied. M. Seismitt-Doda, the leading delegate of Italy, declared in the course of the proceedings that Italy was there "to sustain the principle of bi-metallism." On another occasion he thought the conference "would not know how to separate without having voted a motion affirming the necessity of doing something in the interest of the rehabilitation of silver, with the proportion of 1 to $15\frac{1}{2}$." It was noted, however, as a significant circumstance that, in passing the act for the resumption of specie payments, the Italian Chamber had declared that "it can not be obligatory on private individuals to receive silver money which does not bear the mint-mark of the country." This was taken as an indication of a disposition to be free from the stipulations on which the Latin Union is based, one of which recognizes the international character of the money coined by its members. Among the propositions advanced was one by the German delegate, suggesting that if the United States, France, Italy, and Holland agreed to an unlimited coinage of silver at the ratio of $15\frac{1}{2}$ to 1 of gold, the other states might observe certain conditions, such as not coining gold in denominations lower than ten francs, and improving the fineness of silver coins. On the 19th of May the following order of the day was adopted: "After having heard the general discussion and examining the monetary situation from an international point of view, and having regard to declarations made in the name of certain governments, and in consideration of the fact that several delegates desire a temporary suspension of the sittings in order to refer to their governments, the conference decides to adjourn until June 30th."

Before the adjournment, Sir Louis Mallet made a statement of the views of the Indian Government. It would engage, he said, not to change the system of free mintage of silver during a period to be settled by ulterior negotiations, provided a certain number of the principal states undertook to maintain such free mintage for the same period at the ratio of $15\frac{1}{2}$. He claimed for India that she had done more than any other country to prevent an aggravation of the depreciation of silver; for the Calcutta and Bombay mints coined silver in 1879, the date of the last return, to the amount

of seven millions. India, moreover, was in no way responsible for the depreciation, but had been a victim of the action of others, so that she not only had a right to offer to co-operate in efforts for maintaining the value of silver, but had in a certain sense a right to call for such efforts. Reviewing the monetary conferences of 1869 and 1878, Sir Louis remarked that the latter, while reversing the decision of the former against silver, left it to the discretion of each state to use either metal or both; but a better solution was required. The loss by exchange of the Indian Treasury last year was estimated at two millions; the greater part of the remittances to England was obligatory and permanent, and an increase of the revenue was difficult; the land-tax being assessed in perpetuity in Bengal, and for terms of years elsewhere. He dwelt on the inconveniences to commerce of an uncertainty in the value of the rupee, and urged that a stable international money was imperatively preferred, and insisted that if law was entitled to impose a single metal as money, it had an equal right to impose two metals at a fixed ratio. The impossibility of England joining in the scheme should not be considered fatal to its success; while the failure of the conference might involve, not the maintenance of the *status quo*, but the extension of the gold standard. If the fall of silver continued, India, on the discovery of fresh gold-mines or some other opportunity, might reluctantly enter into the struggle for the possession of the only metal having a firm international basis. The difficulties on the side of England and Germany must have been foreseen, and he exhorted France and America not to be thereby deterred from persevering in an effort which, like all great reforms, might require time, patience, courage, and faith.

Before the separation of the delegates, they were presented with samples of a five-franc piece composed of gold and silver in equal proportions, and struck by the French Government as a suggestion in regard to international bi-metallic money.

The conference reassembled on the 30th of June, but after a brief sitting adjourned to July 2d. The Austrian delegates returned, with fresh instructions to maintain a friendly attitude in regard to bi-metallism, but not to depart from the reserve previously displayed. M. Thorner, the Russian delegate, had made a report to his government, in which he said that Russia should prepare for the resumption of specie payments by permitting the circulation of silver and gold at a premium, and that, when resumption becomes possible, silver should be the standard, gold being permitted to circulate at a premium corresponding with its market price in silver. The premium should be fixed from time to time by the Government, and not follow the minor course of fluctuations. The Italian delegate reported that his government would enter the proposed union for sustaining the double standard, on

condition of coining silver to a restricted amount. In view of the attitude of various other governments, Mr. Thurman, of the United States delegation, expressed the conviction that the offers of England and Germany would not warrant the United States in allowing the coinage of silver. The United States, he said, did not insist on immediate and unqualified bi-metallism, but were ready to accept approaches thereto, believing it would eventually prevail; but they could not incur the risk of altering the standard through the conflicting or inharmonious action of other states.

The position of the Bank of England was stated by Mr. Fremantle. In reply to an inquiry from Lord Granville as to the terms on which the bank would be willing to resort to the practice of holding silver bullion in the issue department, it had been explained that the possibility of doing so "depended entirely on the return of the mints of other countries to such rules as would insure the certainty of the conversion of silver into gold and gold into silver. These rules need not be identical with those formerly in force." It was needless, however, that they should be such as would secure the facility of exchange, indispensable to the resumption of silver purchases by the Bank of England, whose responsibilities are contracted in gold.

The general position of the British Government was stated in the House of Commons by Mr. Gladstone in the following terms:

No engagement has been made by the Government, and no authority conferred on the British representative at the Paris Conference, to alter the limits now imposed by law upon the use of silver as currency. The Government were informed that an agreement might be possible between the silver-using powers, if, among other matters, the Bank of England would hold in the issue department part of its reserve in silver; and they communicated their information to the bank, inviting the Bank Court to state its opinion upon such an exercise of the discretion intrusted to the bank by the act of 1844. The Court replied that it saw no reason why an assurance should not be conveyed to the Monetary Conference if the Treasury thought it desirable; that the bank, agreeably with the act of 1844, will be always open to the purchase of silver, provided that mints of other countries return to such rules as would insure the conversion of gold into silver and silver into gold. The Treasury, noting the statement of the bank that it saw no danger to the principle of the act of 1844 in such an assurance, caused the delegate of the United Kingdom at the conference to be instructed to convey the assurance to the conference. Mr. Fremantle informed the conference accordingly, at its meeting of yesterday [July 8th]. The Secretary of State for India will state whether he has authorized the delegate of India to convey any assurance to the conference. There is no intention on the part of the Government to alter the present currency law.

Lord Hartington made the following statement:

The only engagement which the representatives of the Government of India at the Monetary Conference have been authorized to make on behalf of that Government is that for a definite term of years it will undertake not to depart in any direction calculated to lower the value of silver from the existing practice

of coining silver freely in the Indian mints as legal tender throughout the Indian dominions of her Majesty. Such a declaration, however, must be conditional on the acceptance by a number of the principal states of an agreement binding them in some manner to open their mints for a similar term to the coining of silver as full legal tender in the proportion of 15½ of silver to 1 of gold, and the engagement on the part of India would be obligatory only so long as that agreement remained in force.

Sittings were held on the 4th, 6th, and 8th of July, and then an adjournment was taken to April 12, 1882. A declaration, consisting of four clauses, was made to the conference by the French and American delegates by way of formulating the basis for future proceedings. The first three clauses were declaratory of the importance of a fixed relation in value between gold and silver, of the opinion that a powerful combination of states might, by agreement among themselves, maintain such a relation, and that the proportion of 15½ to 1 was the desirable one to adopt. The fourth clause was as follows: "Without considering the effect which might be produced by a lesser combination of states, a combination which should include England, France, Germany, and the United States, with the concurrence of other states both in Europe and on the American Continent, which this combination would insure, would be adequate to produce and maintain throughout the commercial world the relation between the two metals that such a combination should adopt."

The proposition for adjourning was put upon the ground that "there is reason for believing that an understanding might be established between the states which have taken part in the conference, that the monetary situation of several states may call for the intervention of legislation, and may give rise to diplomatic negotiations."

Ex-Senator Howe returned to the United States in July. He explained the attitude of the different governments represented at the conference as follows:

The Belgian representative was there as a strong monometallist; so also were the representatives of Sweden, Norway, and Switzerland. The commissioners representing Russia, Austria, Italy, and Spain inclined strongly to bi-metallism. The attitude of Great Britain was the principal obstacle we had to contend with. Her representatives were in favor of the double standard, but were prohibited from committing the nation to it. The ministry opposed bi-metallism, and they did it, not because they do not favor the double standard, or because they want to keep silver out of the coinage, but because they have other important business before them, and feel that they can put the coinage question off to some future day. The matter, however, has been the subject of discussion in financial and commercial circles in Great Britain, and a strong sentiment has been found in favor of bi-metallism. With regard to Germany, her representatives pointed to the action taken by her in 1873 in adopting the single gold standard, and said they did not see any necessity for impeaching the propriety of that move. Still, they are not opposed to silver, and are only waiting for England. If the latter country comes to adopt the double standard, they will join with her willingly and gladly.

Mr. Evarts returned in September, and, in answer to inquiries regarding the results of the conference, said

that a great advance had been made as compared with the results accomplished by the conference of 1878. In that assemblage the great powers were very reserved, or were wholly unrepresented. Now the principal countries of Europe, including Germany and Great Britain, both of which held aloof in 1878, are generally agreed upon the advisability of the adoption of a bi-metallie standard of commercial values. So far as India was concerned, which is the great silver interest of England, there was considerable freedom and considerable active participation shown by the delegates this year. The position of the United States is well known and understood now in Europe—that our interest is solely in view of our actual and expected participation in the commerce of the world. We desire that the money of international commerce shall be upon the basis which leaves commerce in such a position that it shall not be embarrassed by the two bases—silver and gold—interfering with one another. In other words, we desire to make the two metals international money.

In regard to the adjournment, Mr. Evarts said:

In adjourning to another time instead of terminating our deliberations we generally agreed in feeling that a stage had been reached in exciting the attention of the different nations, furnishing them the means of debating the question which, in the interval, might be occupied by them either in direct diplomatic correspondence on the subject or in such discussion in Congress or in Parliament, or in general channels of public opinion, as each nation should think advisable and useful. We also thought it would be felt and understood everywhere that so great a question and transaction as the establishment of an international money, of both metals, was a task that should not, and could not, be completed in any brief consideration of the subject.

The coinage of silver dollars was continued during the year in the United States in accordance with the provisions of the law of 1878, the total number issued being 27,637,955, or about 2,300,000 per month. The Director of the Mint, in his annual report, makes the following suggestions in regard to a continuance of this coinage, in view of the action of the Monetary Conference:

The International Monetary Conference which met at Paris in April last instructively discussed the subject of a common ratio in the coinage of gold and silver, but no practical conclusion was reached. Delegates from several European countries gave little encouragement for the expectation of any effective aid from their governments in the effort to restore silver to its former place in the monetary circulation. The hope, however, seems to have been entertained that further deliberation, and a consideration of the inevitable complications and disturbances to commercial exchanges between Asiatic countries and the Western world, to be feared from the exclusion of silver from coinage, will enlist the co-operation of those nations in this, possibly the final, effort to retain silver conjointly with gold as a measure of values. In view, however, of the failure of the conference to agree upon any practical measure, and while awaiting its future action, it is a question for our serious and early consideration whether it is not desirable to suspend the further coinage of silver until, by international agreement and effective legislation, the unlimited coinage of silver and gold at a common fixed ratio shall have been authorized by the principal commercial nations of Europe and America. The United States has done

its part toward retaining silver as a monetary agent for measuring and exchanging values. For three years it has appropriated to coinage purposes one third of the world's production of silver, and maintained its average bullion price nearly to the average of 1878. As was said in my first report, "should the \$650,000,000 of silver coin, now full legal tender in Europe, be demonetized, the United States could not, single-handed among commercial nations, with no European co-operation or allies, sustain the value of silver from the inevitable fall. With that danger menacing us, we can not, without serious embarrassment, continue such coinage unless other commercial nations will agree upon the general use of silver as well as gold. But should such international agreement be secured, neither our ratio of comparative valuation nor even one based upon the present exchangeable value of gold and silver will probably be adopted. The ratio of 15½ to 1, already approved and in use among the nations composing the Latin Union, would doubtless be chosen. This would, if the coinage of silver as well as gold at all the mints of the world were made free, as bi-metallism implies, cause the voluntary withdrawal from circulation of the standard dollars, and their recoinage. In such case the further coinage of silver dollars of the present weight, unless needed for circulation, is a useless expenditure."

The Secretary of the Treasury, in his annual report, and the President in his message, also recommended a suspension of the coinage of silver dollars, and a future restriction, not to an arbitrary limit, but to a limit determined by the actual demand for circulation. They also recommended a cessation of the issue of silver certificates, and advocated a policy in future in regard to bi-metallism dependent on a substantial concert of commercial nations.

BLANQUI, AUGUSTE, a French Democrat and Socialist, died January 2d, at the age of seventy-six. Without ever having formulated any definite objects to which his extraordinary political activity was directed, he has appeared in the character of a leader in every revolutionary movement of the century. When a student in Paris, his intellectual gifts were widely remarked. He commenced life as a private tutor. A mutual attachment sprang up between him and his second pupil, the daughter of a Paris banker, which was concealed for years, and then resulted in their marriage. After seven years of happy wedded life, Blanqui embarked in his career of a political conspirator. His condemnation to life-long imprisonment so wrought upon his wife's mind that she died within a year. Since then Blanqui has passed thirty-seven years of his life in prison. He founded numerous secret societies, and was the chief organizer of nearly every democratic outbreak. Lamartine says that after the Revolution of 1848 he invited Blanqui to forsake destructive criticism, and devote his talents to the diplomatic service of his country, offering him a foreign mission. Blanqui was small and insignificant in appearance. He lived like an ascetic, using no wine or coffee, eating vegetable food only, dispensing with fire in all weathers, and leaving his chamber-windows always open. Though the most active instigator of violent uprisings in

France, he had a sentimental horror of bloodshed; and though always foremost in revolutionary and socialistic disturbances, he frequently expressed the conviction that strong government was necessary to prevent anarchy, and that the economic problem could not be solved perhaps in centuries. The Communards of Paris converted the funeral of Blanqui into a celebration of the amnesty.

BLUNTSCHLI, Professor JEAN GASPARD, jurist and writer on international law, born at Zürich in March, 1808, died October 21st. He was educated for the law in his own country, and afterward went to Germany, where he was a pupil of Savigny and Niebuhr. His work on "Succession according to the Roman Law" gained him the doctor's degree at Berlin. Upon his return to Switzerland, he engaged actively in the political conflicts of the time, and contributed frequently to the Liberal press. He became a member of the State Council, and was a member of the Ministry before the return of the Conservatives to power. In 1838 he published the "Political and Juridical History of Zürich." He assisted the brothers Grimm in their researches into German antiquities, and wrote several works on national history. His work on "General Political Law" (Munich, 1850) established his reputation as an historian and jurist. When the University of Zürich was founded, in 1833, Bluntschli was appointed a titular professor. In 1861 he went to Heidelberg as Professor of Public Law. In recent years he has published several works on the history and theory of law, which are studied with great attention in Europe. In the early part of 1881 he was provoked into an amicable controversy with General von Moltke by the latter's strictures on the reform in the laws of war proposed by the Institut de Droit International, and his defense of war as an agency in higher civilization.

BRAHMO SOMAJ, THE. The division in the Brahmo Somaj of India, which took place in 1878 (an account of which is given in the "Annual Cyclopædia" for 1879, article BRAHMO SOMAJ), has been made wider in consequence of a new departure that the wing of the church of which Keshub Chunder Sen is regarded as the leader has taken. The new movement assumed a definite form at the close of the celebration of the fifty-first anniversary of the Brahmo Somaj, when Mr. Sen's party assumed the name of the "Church of the New Dispensation," and the "Flag of the New Dispensation," intended to denote the church militant developing into the church triumphant, was formally inaugurated, with the *Arati* ceremony, or the waving of lights and the chanting of hymns. The "New Dispensation" is believed by Mr. Sen to afford a scheme for effecting the unity and harmony of all other dispensations, all of which—Hinduism, Buddhism, Islamism, and Christianity—are connected as parts of the divine scheme, and really exhibit order and continuity where confusion

and anomaly only are commonly perceived. The new order is the happy welding of these together, and in it the fulfillment of Christ's prophecy of the coming of the Comforter is to be sought. Christ is not held to be divine, as in the orthodox churches of Christianity, but is regarded with great reverence and devotion as a prophet, and is allowed a subjective not an objective divinity. God is believed in as an objective reality, a supreme Father, whose character of divine holiness worshippers aim to assimilate and realize in their hearts. Communion is sought to be promoted with prophets and departed saints, who are supposed to be real persons and children of God, by the so-called pilgrimages, in which a particular room represents the historical site, and conversations are carried on, by the aid of a vivid imagination, with the person invoked, whose utterances of centuries ago, says Dr. William Knighton, in the "Contemporary Review," "are applied, more or less skillfully, to the exigencies of the present time, or the difficulties of existing theological speculation." The spirits are not supposed to be materialized or actually present, but to be spiritually drawn into the life and character of the devotee; the pilgrimages being explained to be simply practical applications of "the philosophy of subjectivity." The believer may be aided by the perusal of the sacred books of the several religions, by studying the precepts and examples, and absorbing the spirit of which he is believed to be brought into communion with the authors of those religions, or to have "conferences" with them. The immortality of the soul is taught, with the idea that the future life is a continuation and development of the present life. The incarnation of Deity is denied, but all the great teachers of religion, from Moses to Mohammed, are recognized as God's servants and as useful teachers. A violation of duty is sin, and every sinner must suffer the consequences of his own sinfulness, in this world or the next. Holiness may be attained, however, and sinfulness extirpated by the worship of God, by self-control and self-denial, by repentance, by the study of God in nature and in good books, by good company, and by solitary contemplation; and by these means salvation is attained. No mediation between God and man is suggested. Salvation brings with it a perpetual growth in purity, which goes on for all eternity. The New Dispensation is openly and fearlessly declared to be the work of God and not of man, a beautiful symmetrical plan of providence in a course of daily development, which provides an infallible remedy for human wants and shortcomings; a "system of Divine eclecticism, absorbing all religions, incorporating in itself all the prophets of God."

Among the peculiarities of ritual of the New Dispensation are the *Arati* ceremony, with which the flag was inaugurated, and which has been criticised as savoring of idolatry; and the sacramental ceremony, in which rice and water

are substituted for the ordinary bread and wine. The "vow of self-surrender" is taken by persons who enroll themselves in the order of "Grihastha Vairagi," or ascetic householders—men of the world who, following secular employments, give all they make to the church. The singing of hymns from door to door, for the benefit of the worldly-minded, which was formerly confined to the lower classes of people, has been commended under the New Dispensation to the middle and upper classes as an "exalted work."

The fifty-first anniversary of the Brahmo Somaj was celebrated by the adherents of the New Dispensation in a series of meditative and mystic ceremonies, which, with the days of preparation, occupied most of the month of January. A portrait of Ram Mohun Roy was unveiled. Five missionaries were consecrated to a life in which they were told they would be wholly under the guidance of Heaven, and would find themselves always in a state of complete harmony with each other, drawing their inspiration from the Almighty alone, who would speak to and through them. The report for the past year mentioned as its peculiar, pre-eminent feature, the "communion with saints," which was observed by eight pilgrimages of the missionaries and other Brahmos to the house of the minister (Mr. Sen), with honors to the following saints: Moses, February 22d; Socrates, March 7th; Sakya, March 14th; Mohammed, September 19th; Chaitanya, September 26th; scientific men, October 3d. An average of one hundred students had attended the theological institution. Fifteen missionaries had been employed in Calcutta and six in Dacca, besides fourteen secular missionaries. Thirteen somajes had been established, and the flag of the New Dispensation had been carried all around India. A letter was read from the Prarthana Somaj, of Bombay, expressing the hope that all schism might be healed, and that there might be a united theistic church in India, which was suitably responded to. Steps were taken to publish a reply to misrepresentations which, it was alleged, had been made of the Brahmo Somaj in India and England. The missionaries were given the distinctive title of *Sraddheya Bhair*, or Reverend Brother. A sacramental ceremony was celebrated on the 6th of March. On the 7th of June "a new Hom ceremony," or fire-sacrifice, was celebrated as the "ceremony of overthrowing temptation," and was followed on the 12th by a "new baptismal ceremony," in which it was claimed that "the rite was administered by John the Baptist himself, who was present in spirit."

A considerable majority of the Brahmo Somajes, including one hundred and forty churches in different parts of India, from Assam to Sindh, and from Lahore to Madras, adhere to the old order, and either oppose the New Dispensation or hold aloof from it. The chief of these societies is the Sadharan (or Univer-

sal) Brahmo Somaj of Calcutta, which has also many members among the provincial somajes, and has regular agents in various parts of India. Its aims are stated in its annual report to be, first, "to develop within itself and encourage in others a life of piety, based upon direct and immediate communion with the living God; to promote absolute spiritual freedom by combating all doctrines of incarnation, mediation, or prophetship; to build morality and piety on foundations of reason and conscience, illumined by the light of divine intercourse; and to strive for a life in which devotion and earnest work will commingle"; and, secondly, to introduce a constitutional and representative mode of church government. The declaration of principles, read at the dedication of the church in Calcutta in January, enforced the worship of the One True God, to the exclusion of every created person or thing, and of divine honors "to any man or woman as God, or equal to God, or an incarnation of God, or as appointed of God"; the renunciation of distinctions of caste or social position; the catholicity of Brahmoism ("no book or man shall be acknowledged as infallible, and the only way to salvation; but, nevertheless, due respect shall be paid to all scriptures, and the good and great of all ages and countries"); and the maintenance of spirituality of doctrine. "Flowers, spices, burnt-offerings, candles, and other material accompaniments of worship," it said, "shall never be used, and care shall be taken to avoid everything tending to reduce religion to mere parade and lifeless forms. . . . Anything that will directly or indirectly encourage idolatry, engender superstition, take away spiritual freedom, lower conscience, or corrupt morals, shall never be countenanced." The Sadharan Brahmo Somaj sends missionaries over India, sustains societies for religious culture among the students of Calcutta, and maintains a theistic library and a school for the higher education of boys, with twenty teachers and 389 pupils, and labors by itself, and through associated societies of women, for the improvement of women. Among the reforms advocated by the theists of India, of whom both of these societies are branches, are the complete abolition of all caste restrictions; the abolition of the worship of deceased ancestors; a reform of the ceremonies usual at births, and at cremation; reform of marriage customs (which is pronounced equivalent to the reconstruction of Hindoo society); the promotion of female education and emancipation; the limitation of men to one wife; the removal of the prohibition against the marriage of widows, and social reform; the suppression of intemperance of all kinds; the promotion of education among the people; and the social and moral regeneration of India.

BRAZIL (IMPERIO DO BRAZIL). (For details relating to area, territorial divisions, population, etc., reference may be made to the "Annual Cyclopædia" for 1878.)

The Emperor is Dom Pedro II, born December 2, 1825; proclaimed April 7, 1831; regency until July 23, 1840; crowned July 18, 1841; married September 4, 1843, to Theresa Christina Maria, daughter of the late King Francis I of the Two Sicilies.

The Cabinet in 1881 was composed of the following ministers: Interior, Baron Homem de Mello; Justice, Councilor M. P. S. Dantas, Senator; Foreign Affairs, Councilor P. L. Pereira de Souza, Deputy; Finance, Councilor J. A. Saraiva, Senator, and President of the Council of State; War, Councilor Franklin Doria, Deputy; Navy, Councilor J. R. Lima Duarte, Deputy; Public Works, Commerce, and Agriculture, Councilor M. Buarque de Macedo,* Deputy.

The Council of State was composed of the following members in ordinary: The Princess Imperial, Donna Isabel; Prince Gaston d'Orléans, Count d'Eu; the Senators Viscount de Abaeté, Viscount de Muritiba, Viscount de Bom Retiro, Viscount de Jaguary, Viscount de Niotheroy, Viscount de Araxá, J. P. Diaz de Carvacho, and J. J. Teixeira, Vice-Admiral J. R. de Lamare; Dr. P. J. Soares de Souza; and of members extraordinary: Senators J. L. C. Paranaçu and M. P. S. Dantas; Councilors Martin Francisco, B. A. de M. Taques, and J. C. de Andrade; and Viscount de Prados.

The President of the Senate, which comprises 58 members elected for life, was Viscount de Jaguary; and the Vice-President, Count de Baependy.

The President of the Chamber of Deputies, with 122 members elected for four years, was Viscount de Prados; and the Vice-President, F. de Almeida.

The Presidents of the several provinces were as follows:

Alagoas.....	Dr. J. E. Ferreira Jacobina.
Amazonas.....	Dr. A. J. Furtado.
Bahia.....	Senator J. L. C. Paranaçu.
Ceará.....	Senator P. Leão Veloso.
Espírito Santo.....	Dr. M. A. Tostes.
Goyaz.....	Dr. J. A. Leite de Moraes.
Maranhão.....	Dr. P. S. Cincinato.
Matto-Grosso.....	Colonel J. M. de Alencastro.
Minas-Geraes.....	Senator J. F. Melraide Vasconcellos.
Pará.....	Dr. M. P. Souza Dantas Filho.
Parahyba.....	Dr. J. Ferreira Carneiro.
Paraná.....	Dr. S. B. Pimentel.
Pernambuco.....	Dr. J. A. de Azevedo Lima.
Piauhay.....	Dr. S. Q. de Moura.
Rio Grande do Norte.....	Dr. A. D. Satyro.
Rio de Janeiro.....	Dr. Martinho A. S. Campos.
Santa Catharina.....	Dr. J. R. Chaves.
São Paulo.....	Senator F. C. de Abreu e Silva.
São Pedro (Rio Grande do Sul).....	Dr. F. P. Soares Brandão.
Sergipe.....	Dr. H. M. Inglês de Sousa.

The Archbishop of Bahia, the Rt. Rev. L. A. dos Santos (1880), is Primate of all Brazil; and there are eleven bishops: those of Pará, São Luiz, Fortaleza, Olinda, Rio de Janeiro, São Paulo, Porto Alegre, Marianna, Diamantina, Goyaz, and Cuyabá.

The Brazilian Minister Plenipotentiary and Envoy Extraordinary to the United States is

* Died August 29, 1881. (See OBITUARIES, FOREIGN.)

Councilor Lopes Netto (transferred from Montevideo in July, 1881); and the Brazilian Consul-General at Baltimore (for the Union) is Senhor Salvador de Mendonça.

The United States Minister to Brazil is Hon. James Monroe (1881); and the United States Consul-General at Rio de Janeiro is Mr. Thomas Adamson. "We learn, with the greatest pleasure," writes a Rio journalist, referring to the appointment of Minister Monroe, and to the continuance of Mr. Adamson in the consulate-general, "that the Honorable James Monroe has been nominated by the President of the United States as representative of that great republic at the court of Brazil. Mr. Monroe will be no stranger in Brazil; he is already known here as a consul who discharged his important duties with zeal and integrity; and his precedents here afford the certainty that the United States will find in him a resident Minister in Brazil who will reflect honor on his native country. As regards the present United States consulate-general at Rio de Janeiro, we are rejoiced to find that no change is contemplated in its occupancy by the gentleman who has so worthily discharged the duties thereof, and reformed it. As the New York correspondence says, Mr. Adamson is not popular among a certain class of American citizens here; but consuls, like ministers of state, who initiate and enforce necessary reforms, must count on having to endure much obloquy from the small but noisy class whose interests the reforms traverse. Still, every important American and other house, having business with the United States consulate-general here, will freely acknowledge that, in Mr. Adamson, we have had the best American Consul-General Rio has seen since the days of 'Honest James Monroe.'"

The actual strength of the army in 1880 was 15,304, of whom 1,743 were officers. The distribution of the several arms was as follows: Infantry—twenty-one battalions, eight garrison companies, and one depot company for drill-service; cavalry—five regiments, one squadron, and five garrison companies; artillery—three mounted regiments and five foot-battalions; sappers and miners, one battalion; gen-darmes, 8,340, of whom 931 were at Rio de Janeiro. The National Guard had been disbanded, with a view to reorganization after the taking of the new census. Pursuant to the law of February 27, 1875, military service is obligatory for all Brazilian citizens; but numerous exemptions are admitted, and substitution is allowable. The period of service in the regular army is six years, and in the reserve three years. The regulation war strength was to be fixed at 32,000; and the strength in time of peace, although fixed at 13,000, is commonly in excess of that number. The navy, in 1880, consisted of nine steam ironclads, six steam corvettes, sixteen steam gunboats, six steam transports, and three sail of the line (one cor-

vette and two smaller craft); with an aggregate of 3,758 men, and a total armament of 166 guns. The aggregate steam-power was 8,660 horses. Besides the vessels above enumerated, there were five iron-clad ships, one gunboat, one school-ship, and one brig for midshipmen, all without armament. The *personnel* of the navy consisted of 14 general staff-officers, 340 first-class officers, a sanitary corps 73 strong, 17 almoners, 88 accountants, 57 guardians, and 185 engineers; an imperial marine corps, 2,695 strong, a naval battalion of 286 men, and 1,229 apprentices; total, 4,984 men. An additional gunboat has been reported "in course of construction" for some years past; but mention must here be made of two important craft, officially described as follows: One of these, an ironclad of novel construction, contracted for in London in 1881, is to be 300 feet in length with 52 feet beam, and to carry four Armstrong twenty-ton, new pattern, breech-loading guns, mounted on two turrets arranged *en échelon*, and sufficiently far apart to avoid injury to one turret by the flash of the guns in the other. The lighter armament is to consist of six 4½-inch guns and a signal-gun. The armor is to be steel-faced throughout; the armor-belt, of two strakes, 7 feet deep and varying in thickness from 10 to 11 inches; and the breastwork and turrets each 10 inches thick. The main-deck will be faced with 1½-inch compound armor on a steel backing ½ inch thick. The stem, stern, rudder, brackets, and tubes will be constructed of brass, while the hull will be double sheathed with wood and covered with Muntz-metal. Prominent among the advantages anticipated in this ironclad are: the protection of the magazines and the spaces beneath the breastwork, fore and aft of which the armor-belt will pass inside and take the form of oblique armor; the diminution of weight consequent upon that arrangement, and the security against water lodging upon the inner protective deck in the event of piercing of the thin ends of the armor; and the use of the forced blast, with a horse-power readily increased from 6,000 to 8,000, and a speed of not less than 15 but susceptible of being accelerated to 16½ knots an hour. Should the ship, on trial, fail by one quarter of a knot to make 15 knots, the builders will, by the terms of their contract, be held to forfeit £2,000; if by one half knot, £4,000; if by three fourths, £8,000; if by one knot, £16,000; if by 1½ knot, £32,000: and should the speed fall short of 13½ knots, the whole of the final installment, amounting to one sixth of the entire price, will be forfeited. Should the extreme draught of the ship, with 400 tons of coal and sea-going stores on board, exceed 20 feet, the forfeitures will be as follows: for an excess of 1 inch, £1,000; of 2 inches, £2,000; of 3 inches, £4,000; of 4 inches, £8,000; of 5 inches, £16,000; of 6 inches, £25,000; and of more than 6 inches, the entire final installment. Likewise, for an excess of one tenth

pound per horse-power over the consumption of fuel indicated by the builders for the trial trip of 6 hours at full speed, £2,000 will be forfeited; for two tenths, £4,000; for three tenths, £8,000; for four tenths, £16,000; for five tenths, £32,000. The ship is to be inclined, and her center of gravity ascertained in the usual way. Her metacentric height when loaded for sea is not to be less than 3 feet, and under no circumstances is it to be less than $2\frac{1}{2}$ feet; and by failure in any of these stipulations the contractors are to forfeit the final installment. The other new craft is an iron gunboat to be named *Iniciadora*, and the king-bolt of which was struck by his Majesty the Emperor on October 27, 1881, at the national arsenal of marine. This will be the first iron vessel built there. The dimensions and other details published were as follows: length, 117 feet; beam, 24 feet; depth of hold, 8 feet; draught, 5 feet; with a displacement of 200 tons, and engines of 260 horse-power, expected to give a speed of from 9 to 10 knots an hour. The vessel is to be double sheathed with wood and Muntz-metal; and the armament to consist of two cannons of 15 caliber at the bow and stern, with $\frac{1}{4}$ -inch steel plate casemates for protection against musketry; two machine guns and torpedo apparatus. Electric light will be used on board the *Iniciadora*, which is to have steel-wire schooner rigging, have capacity for one month's supplies for 60 men, and carry coal for 5 days. This gunboat is specially intended for river service.

The subjoined table of the latest official returns at hand from the Finance Department, being for the year 1877-78, will serve to show the sources of the revenue and the branchess of the expenditure, but not the real condition of Brazilian finances at the present time:

REVENUE.	
Customs receipts.....	\$36,507,474
Imposts on shipping.....	65,743
Internal revenue.....	14,156,169
Deposits.....	762,417
Emancipation fund.....	521,560
Receipts extraordinary.....	3,270,171
Total.....	\$55,372,840
EXPENDITURE.	
Ministry of the Interior.....	\$11,207,295
“ of Foreign Affairs.....	504,293
“ of Finance.....	25,526,199
“ of Justice.....	3,231,823
“ of Commerce and Agriculture..	21,053,020
“ of War.....	7,917,394
“ of the Navy.....	6,801,731
Total.....	\$75,746,195
Deficit.....	\$20,373,355

In the budget for the fiscal year 1881-'82, the revenue was estimated at \$58,479,000, and the expenditure, in round figures, at \$59,143,380; thus showing a deficit of but \$664,380. As for 1880, the revenue appears to have been "greater in that year than any of the preceding years." The customs receipts from exports gave a total of \$21,425,497, against \$20,877,662 in 1879; though the receipts from

imports were but \$4,765,585 in 1880, against \$4,900,163 in 1879. Hence the actual increase of revenue from the customs department in 1880, as compared with 1879, was but \$413,257. Much more favorable results were expected by the Government from the tariff which went into operation on January 1, 1880; but economists foresaw that a measure so unsatisfactory to the commercial community could hardly prove profitable to the treasury; for, although merchants had been requested to take part in the work of revising the former tariffs, their suggestions had only been regarded as worthy of consideration when favorable to increased rates of duty.* The new tariff undeniably made some improvements, such as the suppression of unnecessary distinctions and the approximation of official to market value; but, on the whole, the revision was performed too rapidly to admit of proper attention to fiscal conveniences. A new revision was ordered toward the close of 1880, and the work intrusted to a committee composed wholly of government employes; but the expediency of submitting the result of their labors, when these should be terminated, for examination to a committee of merchants and another of manufacturers, was strongly urged by the public press.

The amount and branches of the national debt of Brazil were reported as follows on December 31, 1880:

Foreign loan of 1852, due 1882.....	£390,300	
“ “ 1858, “ 1888.....	236,800	
“ “ 1860, “ 1890.....	452,100	
“ “ 1863, “ 1893.....	1,871,100	
“ “ 1865, “ 1902.....	5,575,900	
“ “ 1871, “ 1900.....	8,028,200	
“ “ 1875, “ 1913.....	5,079,500	
Total foreign debt.....	£16,704,000 =	148,667,600†
Six per cent internal funded debt.....		835,897,100
Five “ “ “ “.....		1,995,000
Four “ “ “ “.....		119,600
Six “ gold bonds of 1868.....		23,892,000
Four and a half per cent gold bonds of 1879.....		50,235,000
Treasury bills.....		16,488,800
Five per cent private loan.....		700,000
Various deposits, about.....		50,000,000
Paper money.....		189,250,000
Total national debt.....		819,783,100†

A new loan of £5,000,000 was talked of in July as probable, and as necessary to permit the payment or funding of the existing floating debt.

In a report made in 1879 by the Minister of Finance, the total debt stood at 779,116,837 milreis = \$389,558,418.

The most recent complete official returns of the foreign commerce of the empire are those for 1878-'79, in which year the exports and imports were, as stated in our volume for 1880, of the total values of \$102,029,250 and \$81,752,900 respectively.

The nature and value of the commodities imported from Great Britain in 1880 were as shown in the subjoined table:

* See "Annual Cyclopædia" for 1880 and for 1878.
† \$74,332,800. ‡ \$409,866,550.

Cotton manufactures.....	£3,837,525
Linen manufactures.....	128,024
Woolen and worsted manufactures.....	51,224
Jute manufactures.....	132,123
Hardware and cutlery.....	274,099
Coal, coke, etc.....	204,723
Earthenware.....	112,260
Rails of all sorts.....	145,029
Steam-engines.....	105,582
Cast or wrought iron.....	226,493
Machinery and mill-work.....	171,739
Seed-oils.....	84,927

Total..... £4,966,183
= \$24,830,690

Against a total of £3,998,721 (= \$19,993,605)
for the year 1879.

The imports from the same source for the first six months of 1881 were as follows:

Cotton manufactures.....	£349,403
Woolen manufactures.....	27,673
Linen manufactures.....	34,334
Jute manufactures.....	29,220
Steam-engines.....	26,030
Rails.....	101,029
Machinery.....	85,716
Hardware and cutlery.....	83,661
Cast or wrought iron.....	79,523
Earthenware.....	36,729
Coal, coke, etc.....	71,608
Seed-oils, etc.....	18,614

Total..... £1,438,794
= \$7,193,670

Judging from the total of the first of these two tables, that of the second would seem to foreshadow a considerable decrease for 1881 as compared with 1880.

Of all the Brazilian staples of export, coffee is by far the chief. With her 530,000,000* of shrubs, producing on an average 260,000,000 kilogrammes or 572,000,000 pounds annually, Brazil exports nearly one half of the entire quantity of coffee consumed in the world, her home consumption not exceeding 110,000,000 pounds. Her prodigious superiority over all the other coffee-growing countries individually and collectively may be seen by the following figures:

COUNTRIES.	QUANTITY PRODUCED.	
	1855.	1873.
	Kilogrammes.	Kilogrammes.
Brazil.....	163,400,000	225,500,000
Dutch possessions.....	71,322,000	91,404,850
West Indies.....	20,300,000	41,800,000
Ceylon.....	23,815,000	53,422,400
South Africa.....	22,815,000	35,896,000
Arabia.....	6,176,000	2,773,200
Africa.....	4,000,000	4,000,000
Central America.....	3,500,000	82,500,000
Philippines.....	1,853,720	3,396,830
Oceania.....	150,000
Total.....	830,151,880	490,843,200
	= 676,811,354 lbs.	= 1,066,223,560 lbs.

A significant fact of another kind is observed on glancing at the foregoing columns of figures—namely, that while coffee-culture has taken an immense stride in the course of twenty-three years, an astounding development is noticeable in many other countries, and particularly in Central America; and Brazilian planters will do well to reflect that, though the supremacy is decidedly theirs, no means can safely be neglected by them of maintain-

ing their present vantage-ground in the markets of the United States and of Europe. The Brazilian coffee-crops have of late years been abundant. Thus, as has been seen in the table last given, the crop of 1878 was 225,500,000 kilogrammes, or 496,100,000 pounds; that of 1878-'79 was rather smaller, 222,349,800 kilogrammes; that of 1879-'80, still smaller, was 174,543,480; while, on account of 1880-'81, for the first six months, ending on December 31, 1880, there had already been shipped 142,622,820 kilogrammes, or almost seven eighths of the entire quantity exported in the whole of the year immediately preceding. It was regarded as probable that the crop of 1881-'82 would reach 3,000,000 bags of sixty kilogrammes each, or 180,000,000 kilogrammes = 426,000,000 pounds. "The year 1880 was not favorable to coffee exportation," observes a Rio journal. "The European markets remained apathetic during the first half-year, with prices constantly low, while in the United States the presence of large cargoes, presumed to be for account of the Brazilian Government, kept speculators away. At home, holders and buyers found it difficult to agree, as the latter could not go above certain limits in accordance with the situation of the markets the shipments were for; while the sackers, unwilling to sacrifice the article by selling at a low price, endeavored at all hazards to sustain their pretensions. In the last months of the year, when coffee fell considerably in the American markets, some New York and Boston merchants, unable to meet their losses thereby, suspended payments. But no unfavorable impression was felt at Rio; on the contrary, the fortnight in which the news of the failure was received was that of greatest sales here. In ruin, the production has increased greatly, but the consumption has increased equally, and its use in the fabrication of liquors has of late been extensive. New means of transport have also assisted, by cheapening freight. Of the 15,000 pipes made in the provinces of Rio de Janeiro, about 9,000 proceeded from the Campos market. Pernambuco followed Rio in production, 9,000 pipes having been exported from Recife, and the home consumption being large. In Rio de Janeiro prices were forty per cent higher than at Pernambuco, preventing shipments thither. In tobacco the year 1880 was unprofitable, if not, indeed, one of the losses and liquidations for all the classes depending on the manufacture of Minas tobacco. The low prices which prevailed almost unchanged throughout the year, despite a considerable decrease in the harvest, were attributed, by the parties interested, to the perturbation produced in commercial relations by the new taxes. But, while it is evident that the taxes contributed to the evils pointed out, it is no less so that the principal cause of the decline in prices to the point of being unremunerative consisted in the narrowness of the circle of foreign customers. And thus the three years of abundant

* In 1831.

crops prevented the expected reaction after the suppression of the imperial taxes, by permitting the supply to exceed the consumption."

It should here be observed that sugar is another Brazilian article of export, produced in all parts of the empire, but particularly in the provinces of Pernambuco and Bahia. The quantity shipped, however, is never or rarely in excess of 140 tons, or about the amount of the total shipments from the little island of Mauritius.

There have been no official returns of port movements published since those given in our volume for 1880, to which volume reference may be made for details relating to Brazilian railways and telegraphs. On the subject of the new line of steamers there mentioned as about to be established between Canadian and Brazilian ports, the following particulars were published in Rio de Janeiro in February, 1881:

"St. Thomas, at which port the steamers of this line will call, is the distributing point for the mails and traffic of the West Indies and Central America, and arrangements are in progress with the Royal Mail Steam Packet Company for an interchange of traffic by through bills of lading at that port for the West Indies, British Guiana, and Central America, and at Rio de Janeiro for the republics of the river Plate, thus bringing all these countries into direct communication with Canada. The direct trade of Canada with these countries for the year 1879 has been as follows: Imports, value \$1,256,817; exports, value \$4,242,112; but it has been carried on entirely by sailing-vessels, and will necessarily be further developed by the establishment of this company. It is proposed to employ four steamers in this service, each of 2,200 tons burden, which will run monthly between Canada and Rio de Janeiro, touching at St. Thomas, Pará, Maranhão, Ceará, Pernambuco, and Bahia, between which ports the coastwise traffic in passengers and goods is very important. The contract with the Canadian Government is for three years certain from 1st of May next, thereafter being terminable by six months' notice, as is usual in the Dominion. The Brazilian contract is for ten years, and it is understood that negotiations are in progress for additional subsidies to the company in respect of intermediate ports of call. The company has the advantage of being introduced to public notice by a strong and influential board, and, in view of all the circumstances, it is reasonable to anticipate that the capital will be at once taken up by those who are in search of a favorable form of investment."

The Telephone Company of Brazil had received, by decree of April 17, 1881, authorization to operate in the empire, and it was hoped that contracts would at once be made for the establishment of telephonic communication between Rio de Janeiro and the neighboring town of Niteroy.

The Minister of Agriculture had announced

his intention, as the state of the finances had improved, to apply to the following Legislature for an appropriation in the budget for 1882-'83 for an immigrants' house in Rio, to receive and support for eight days 40,000 spontaneous immigrants per annum, for the transportation of 30,000 immigrants from Rio to their destination, for the acquisition of 53,000 acres of land in readily accessible portions of Southern Brazil, and for the survey of public lands and the making of roads to colonies. He had also declared that the Government would not give further aid or make further subsidized immigration contracts.*

The new electoral reform bill mentioned in our volume for 1880 passed the Senate in the session of 1881. We here transcribe the principal clauses of the bill:

ARTICLE I. The nominations of senators and deputies to the General Assembly, members of the Provincial Legislative Assemblies, and any other elective national or local authority, shall be made by direct elections, in which all citizens enrolled as electors, in conformity with this law, may take part. The election of Regent of the Empire shall continue to be made according to the additional act to the Constitution by the electors treated of in this law.

ART. II. Every Brazilian citizen, in accordance with Articles VI, IX, and XCII of the Constitution of the empire, having a net annual income of not less than 200 milreis from realty, trade, business, or employment, is an elector.

The exclusions of said Article XCII include the men of the army, navy, and police corps, and the workmen of the public departments and establishments.

ART. III. The proof of the income referred to in the preceding article shall be made:

SECTION 1. As to income arising from realty:

(1.) When the realty lies within the bounds of the Imposto Predial or Decima Urbana, by certificate from the fiscal department that the realty is assessed at a rental value of not less than 200 milreis, or by a receipt of the same department for payment of that tax.

(2.) When not within the bounds of the Imposto Predial or Decima Urbana:

If consisting of premises situated where neither of those taxes is levied, of rural establishments, or of lands occupied by the owner, then by computing the income at six per cent upon the capital the realty represents, verified by a legitimate deed of ownership or holding, or by a judicial sentence recognizing either.

If not occupied by the owner, then by reckoning the income in the same manner, or by the exhibition of a contract of lease of the realty entered in notarial books a year before, with express declaration of the price of the lease.

Sec. 2. As to income derived from trade or profession:

(1.) By certificate showing inscription, a year previously, in the "Commercial Register," as merchant, broker, auctioneer, chief clerk of a commercial house, master of vessel, pilot, or administrator of a factory.

(2.) By certificate from the respective fiscal department of ownership of a factory, workshop, or commercial, manufacturing, or rural establishment, with a capital of at least 6,800 milreis, paying an imperial or provincial annual tax of not less than 24 milreis in Rio, 12 milreis in other cities, and 6 milreis in towns and other places of the empire.

The taxes referred to in this provision confer electoral capacity only when paid for at least a year before enrollment.

No taxes but those mentioned in this law can serve for proof of income.

* See "Annual Cyclopaedia" for 1880.

(3.) By certificate extracted from the book of bank companies or commercial or manufacturing associations, legally authorized, proving the citizen to have been employed, for a year previously, at a salary not less than the legal income.

SEC. 3. As to income derived from public or provincial stocks, by authentic certificate that he has held in his own name, or, if married, in that of his wife, for a year previously, stock yielding annually at least the required income.

SEC. 4. As to income derived from shares of legally authorized banks and companies, or from deposits in government savings-banks or others authorized by the Government, by authentic certificate of holding, for a year before enrollment, in his own or his wife's name, shares or deposits yielding at least the said annual income.

ART. IV. The following are considered to have the legal income, independent of proof:

(1.) Holders of scientific or literary diplomas of any legally recognized faculty, academy, school or institute, Brazilian or foreign. The proof will be the diploma itself, or any authentic document replacing it.

(2.) Clerks in holy orders.

(3.) Citizens who have, for upward of a year before enrollment, been directing houses of education or teaching, or have been public teachers, by effective or life-long nomination, or have been teaching in private schools or colleges attended by at least twenty scholars.

A certificate from the inspector or director of public instruction in Rio or in the provinces shall serve as proof thereof.

(4.) Ministers and councilors of state, senators, deputies to the General Assembly, members of the Provincial Legislative Assemblies, the effective vereadores and the justices of peace with number.

(5.) Employés of the diplomatic or consular corps.

(6.) Officers of the army, navy, and police corps, including the active and reserve, retired and honorary with pay.

(7.) Imperial, provincial, or municipal functionaries having pay of over 200 milreis, with right of superannuation.

(8.) Serventuários for life in office of justice, with allowances of at least 200 milreis per annum.

ART. V. Any citizen unable to prove the legal income by any of the modes laid down in the preceding articles will be permitted to do so by the rental value of the house or houses he has lived in, with his own earnings, during at least a year before, the rental value paid by him being 400 milreis in Rio; 300 milreis in the cities of Bahia, Recife, Maranhão, Para, Nietheroy, São Paulo, and Porto Alegre; 200 milreis in other cities; 100 milreis in towns and other settlements; also by rented farms, etc., paying 200 milreis a year rent.

(This proof must be made before a judge.)

All certificates and other documents required for enrollment of electors are exempt from stamp and any other taxes.

ARTS. VI to VIII treat of the enrollment by the municipal judges, with revision by the juiz de Direito, and appeal to the Relação.

ART. IX. Excepting restrictions hereafter enumerated, every citizen included in Article II is eligible as senator, deputy to the General Assembly, member of the Provincial Legislatures, vereador, justice of the peace, and any other charge created by law.

Only section. A special condition of eligibility is: For senator of the empire, to be over forty years of age, and have 1,600 milreis income.

For deputy to the General Assembly, member of the Provincial Legislature, to be over twenty-five years of age, and have 800 milreis income; and, as to naturalized persons, have resided six years in Brazil.

For vereador and justice of the peace, that of residence for at least two years within the municipality.

ART. X enumerates a long list of functionaries in-

eligible as senator, deputy, or provincial member, within the region over which their functions extend, and the ineligibility includes engineers, contractors, furnishers, and others interested in public, guaranteed, or subsidized works, or deriving pecuniary profit from state, province, or municipality works. Shareholders, however, are not included.

ART. XI. No remunerated public functionary can hold his office during the session, if he accepts the legislative mandate; and if he accepts a senatorship, he must at once be superannuated.

Excepting ministers and secretaries of state, councilors of state, bishops, ambassadors and envoys extraordinary on special mission, presidents of provinces, military and naval officers, as to seniority and pay, and senators, etc., obtaining license from their respective chambers.

ART. XII forbids the election of ministers of state as senators while holding office, and for six months afterward, unless the vacancy occurs in the native province or that of domicile.

ART. XIII forbids the acceptance by senators, and by deputies and members of provincial assemblies during the session and six months after, of any paid government or provincial employment or commission, except of counselor of state, president of province, ambassador or envoy extraordinary, bishop, and commander of sea or land forces. It also forbids their obtaining concessions, privileges, contracts, etc., but not patents. Two years of residence in the province is required for election as provincial member.

ARTS. XIV and XV treat of the elections in general.

ART. XVI treats of elections of senators, which must be by separate triple lists for each vacancy.

ART. XVII treats of elections of deputies to the General Assembly, which will be in districts of one deputy. Rio is to have three districts, Bahia and Recife two each.

ART. XVIII treats of elections of vereadores and justices of the peace.

ARTS. XIX to XXI, of penalties.

ART. XXII postpones all elections, except as provided for in Article XXIX of the Constitution, until the conclusion of the first general enrollment, and the Government may delay to the last working day of December, 1881, the general election of deputies to the next Legislature.

ART. XXIII provides for collecting, in a distinct part of the instructions to be issued for the execution of the law, all existing provisions and decisions in harmony with it, to be submitted to Parliament for approval.

ART. XXV revokes contrary provisions.

A novel event for Brazil was that of general elections by a free constituency, untrammelled by government pressure and unbiased by government interference. It was apprehended, however, that electoral reforms may not prove to be an unmixt blessing for Brazil just yet, it being doubtful whether the masses are sufficiently enlightened to see the necessity of breaking with traditional evils and allowing themselves to be carried along by the current of modern progress. The late elections threw a Liberal majority into the Chamber of Deputies, while in the Senate the Conservatives were and still remain in majority; hence the position of a Liberal Cabinet must needs be embarrassing, particularly so when hampered by the parliamentary requirement of an absolute majority in the formation of a quorum. The present Cabinet has little to fear on that score; but, in the case of a successor, the difficulty would at once arise, unless the Liberal majority in the Chamber of Deputies should give

proof of unprecedented assiduity, disciplined union, and abnegation of self-interest.

Nevertheless, and in face of all opposition, the spirit and letter of the emancipation law* of September, 1871, continue to be observed, and every measure is taken that, directly or indirectly, contributes to the accomplishment of the great work of abolition. In December, 1880, the Provincial Legislature of Rio de Janeiro imposed a tax of \$500 on each slave brought into the province, except in the case of slaves already owned when the law was passed, and merely transferred from an estate outside the province to another within the province, and the property of the same planter. A tax of \$15 was imposed on the register of slaves moved from one municipality to another. A bill, signed by the majority of the members, was brought into the São Paulo Assembly, imposing a fee of \$1,000 for the register of every slave, not inherited, brought hereafter into the province. Half the fee was to be applied to emancipations. Thus São Paulo and Minas-Geraes have followed the course of the province of Rio de Janeiro to stop, by prohibitive taxes, the further introduction of slaves.

There were reports that the question of Chinese labor would be brought to test before long, "an eminent American contractor having undertaken to forward to Rio de Janeiro a number of coolies, under contract to serve five years on plantations, at five dollars a month, with rations."

BROWNING, ORVILLE H., born in Harrison County, Kentucky, 1806; died August 10, 1881, at Quincy, Illinois. Early in life Mr. Browning removed to Buckner County, where he went through a course of classical studies at Augusta College, while officiating as clerk in the county and circuit courts. He afterward studied law and was admitted to the bar. In 1831 he went to reside in Quincy, Illinois, where he practiced his profession. Having served through the Black Hawk War, he was elected in 1836 to the Illinois Senate, and four years later to the Lower House, in which he served two years. At the Bloomingdale Convention he co-operated with Abraham Lincoln in organizing the Republican party of Illinois. In 1860 he was a delegate to the Chicago Convention which nominated Mr. Lincoln for the presidency, and during the war he was an active supporter of the Government. In 1861 Governor Yates appointed Mr. Browning to fill a vacancy caused by the death of Mr. Douglas, United States Senator from Illinois. In this position he served for two years with distinction. While in Washington he engaged in the practice of law with Hon. Jeremiah Black and Hon. Thomas G. Ewing. President Andrew Johnson appointed Mr. Browning Secretary of the Interior, and he also acted as Attorney-General for a brief time, upon the retirement of Henry Stanbery, of Ohio. At the expiration

of his service as Secretary of the Interior, Mr. Browning resumed his profession in Quincy, where he continued to reside in active practice up to the time of his death. His State laments his decease as the loss of an able public servant.

BULGARIA, a principality of Southeastern Europe, which was created in 1878 by the Treaty of Berlin, as a dependency of Turkey. Reigning Prince, Alexander I,* elected in 1879; area, 63,972 square kilometres (1 kilometre = 0.386 square mile); population on January 1, 1881, 1,995,701. The population of the principal cities on the same date was as follows: Sofia (the capital), 20,541; Rustchuk, 26,867; Varna, 24,649; Shumla, 22,921; Widdin, 13,602; Tirnova, 11,500; Sistova, 11,438. The only railroad in operation was that from Rustchuk to Varna, 224 kilometres. The number of post-offices in 1879 was 35; the number of letters and postal-cards sent, 337,600; of printed matter and packages, 2,060; of newspapers, 402,454. The length of the government telegraph lines in 1879 was 2,057 kilometres, and of the wires 3,021 kilometres. The number of offices was 31, and of dispatches 99,350. The National Assembly consists of the Exarch or head of the Bulgarian Church, of one half of the bishops, one half of the presidents and members of the Supreme Court, one half of the presidents of the district courts and of the commercial court, and of deputies of the people—one member representing 20,000 persons.

The people of the principality were in 1881 deprived of the Constitution, which, in accordance with the Treaty of Berlin, they had formed to suit themselves. The change from a constitutional monarchy, with exaggeratedly democratic popular rights and guarantees, to an autocratic state, was accomplished by a virtual act of usurpation on the part of their elected prince, Alexander. On the 9th of May the Prince dissolved the National Assembly, and declared the Constitution suspended. The incompetency of the administration, and the mistakes of the majority, whose alleged follies and short-comings had prompted the arbitrary course of the sovereign, were in a measure confessed by the chief members of the Liberal party themselves. Their parliamentary leader, the Minister-President Zancoff, proposed, instead of the total revocation of the Constitution, as demanded by the Prince, its suspension for three years, during which time the Prince should govern with the assistance of a Cabinet and of a Council of State, composed of foreign experts, selected by the Assembly.

The draft of a constitution made by Prince Dondoukoff-Korsakoff was constructed in harmony with the liberal views of the popular party, who have all along carried with them

* For a biography of Alexander I, see "Annual Cyclopædia" for 1879, article ALEXANDER I; for an account of the history of the race, of the progress of education, of newspapers, of industry, and of the Bulgarian Church, see "Annual Cyclopædia" for 1873, article BULGARIA.

* See "Annual Cyclopædia" for 1871.

the majority of the Bulgarian nation. The Russian commissioner fostered the aspirations of the Liberals for a Great Bulgaria, and probably hoped himself to be chosen Prince of the Pan-Bulgarian nation. His draft was modified in a radical sense by the Constituent Assembly at Tirnova. The Constitution, while embodying extreme principles of popular sovereignty based upon universal suffrage, was, in respect to its provisions for the practical conduct of the Government, in many respects imperfect, as every paper constitution instituting a new political system must be of necessity. The Prince possessed no sympathy for popular institutions, and attributed all the friction and the abuses of the Government to the democratic features of the Constitution. The Conservative minority, from whom he had first chosen his ministers, were composed of the semi-aristocracy of the *Tchorbadjees*, who had acquired wealth under the Turkish *régime*, and had come to a *modus vivendi* with the Mohammedan authorities. The Young Bulgaria party, led by men who in the Universities of Vienna and Moscow had imbibed the ideas of Western liberalism and of Russian radicalism, and who were inspired with an enthusiastic national ambition, presented the only doctrines which appealed to the intelligence and patriotism of the people. Their agitation had led to the Turkish war and the independence of Bulgaria, and the leadership of the people and direction of the destinies of the young state naturally devolved upon them. The Prince's repugnance to their advanced ideas of liberty, and his contempt for their nationalistic patriotism, were so fixed that he regarded the direction of affairs by the *doctrinaires* of the Liberal party as a political impossibility.

The difficulty of working the Constitution lay not so much in the "disorganization at home," which Alexander declared to be the effect of popular government in Bulgaria, as in the fact which he embodied in his twin charge, that the Bulgarian Parliament had brought the country into "discredit abroad." This resulted from the reckless thoroughness with which the Liberals were inclined to carry out the principle of Bulgaria for the Bulgarians, in entire disregard of the wishes of the powerful neighboring empires, on whose good-will their country's existence as an independent nation must in a great measure depend. The overweening jealousy of outsiders, expressed in the motto "*Bulgaria farà da se*" of the Liberals, and exemplified in the acts which were denounced as obstructive by the Austrian Government, and those which were construed as ingratitude by the Russians, was the outcropping of the ancient masterful spirit of the Bulgarians, and had asserted itself under Turkish rule in the repudiation of the dictation of the Phanar, their frequent uprisings against the Porte, and their acquisition of the right of entire local self-government.

The administration of the finances by the

Liberal Government had been most successful. Through a redistribution of taxes, they had nearly doubled the revenue, without increasing the burden on the people. The general rates were not greater than under the former Government, and were one third lower than under the Turkish rule. The people, on the contrary, were enabled, owing partly to the new highways and similar public works to which some of the additional revenues were applied, but chiefly to an abundant harvest, to pay the taxes more easily than ever before. When the Conservatives handed the administration over to the Liberals, they had reduced the surplus of 12,000,000 francs received from Prince Dondoukoff-Korsakoff to 7,000,000, during their one year's management of public affairs. The budget which they delivered to their successors provided another deficit for the coming year, the revenue being placed at 16,000,000 francs, and the expenditures at 19,000,000 francs. The revised budget of the new administration balanced revenues and expenditures at 27,000,000 francs, and their estimate for the following year fixed them both at 30,000,000 francs. When dismissed from office by the *ukase* of the self-constituted autocrat, they left a surplus of 17,000,000 francs cash in the Treasury. The excess of revenue was expended in public works, roads, barracks, hospitals, and public-office buildings, and in establishing a system of higher education and erecting buildings for the elementary schools, which are maintained by the communities. For the latter, of which there are 1,088, affording instruction to 56,354 children, a system of state inspection was inaugurated. Nine secondary schools have been established in the principal towns, including two for girls, besides a classical college at Sofia and a priests' seminary at Liscovatz. There is known to have been more or less corruption in the management of the public funds, but they were employed in the main for judicious and useful purposes. Although the people complained of the Government, from a chronic habit of resenting taxation, they were as lightly taxed as ever before, and never had experienced so much prosperity and general well-being. A reform in the treatment of the Mussulman population by the Liberal Government was instituted before their dismissal from power. Persecutions were checked; efforts were made to persuade Christians, who had seized the property of refugee Mohammedans, to return it to the owners, and, in communities having a preponderant Mussulman population, Turkish mayors (*Kmetes*) were appointed. The change in policy was sufficient to stop the emigration, thus keeping in the country a useful agricultural population, as well as strengthening the hands of the Liberals by retaining an element hostile to Russia.

Prince Alexander, after he had suspended the Constitution by proclaiming it unsuited to the requirements of the country, summoned a

Great National Assembly to revise its provisions. The dismissal of the Assembly, and the irregular method by which the Prince sought to have it abrogated by a kind of *plébiscite*, were both infractions of the express provisions of the Constitution, which prescribes that the power to alter and amend shall be exercised only by the Extraordinary National Assembly, convoked in accordance with the action of the Assembly. Prince Alexander's justification of his *coup d'état* was that the Constitution had brought discredit upon Bulgaria abroad and bred domestic disorder. The Assembly, it was charged, was filled in great part with illiterate members, who were incapable of judicious legislation, who wasted their time in fruitless party strife, and imposed incompetent and corrupt Cabinet advisers upon the Prince, and were also engrossed in intrigues to maintain their positions, and had instituted a foreign policy which endangered the existence of Bulgaria. The Liberal party, who maintained that the traditions and character of the Bulgarian people demanded a democratic form of government, proposed to remedy the admitted evils by reducing the number of members in the Assembly, and lowering the age of eligibility from thirty to twenty-five, in order to admit young men who had been educated abroad and were returning in considerable numbers. The strife in the Assembly had been in great measure due to the course which the Prince had pursued, at first, of choosing his ministers from the minority. As soon as he allowed the formation of a Liberal Cabinet, the Assembly applied itself to legislation, and in the period of eight months matured twenty-seven bills, the most important of which were measures to improve national education and to raise the moral qualifications of the clergy, increase their stipends, and free them from the domination of the hierarchy.

The democratic character of the Constitution which, in accordance with the conclusions of the conference of plenipotentiaries at Berlin, the Bulgarian people had framed for themselves, rejecting the extremely liberal Constitution drafted by the Russian commissioner, had from the first excited repugnance and apprehension in the Russian Government. It mistrusted the influence in Russia of the large measure of popular liberty enjoyed by the Slavs across the Danube. The purpose of the Liberal majority to remove the Russian officers who had command of the army, which they had brought to a high standard of discipline and efficiency, was the occasion for a trial of strength between the popular party and the Russian *entourage* of the Prince, re-enforced by court and diplomatic influences of the Czar's Government. The Austrian Government had shown antipathy to Bulgarian liberties from the beginning, and was incensed at the Liberal party on account of its hostility to the Austrian claim to exclusive powers over the Danubian

navigation, a hostility which was shared by the Roumanians.

The Liberal party during its administration of the government had offended three influential classes by reforms affecting them which were in the popular interest. The Russian element was incensed by the over-jealous attitude of the Liberals, whose project of dismissing Russian officers from the military and civil establishments, and of reducing all foreigners in Bulgarian service to an equal footing with natives, precipitated the *coup d'état* which it aimed to avert. The ecclesiastical reforms which subordinated the church to the state, and restricted the authority of the bishops over the parochial clergy, aroused resentment in ecclesiastical circles. The local magistracy also was alienated by a measure of administrative reform which curtailed the powers of the *chorabji* class, or village magnates. The young German prince and Prussian Guard lieutenant, who had been selected as the constitutional ruler of the new principality, regarded with impatience and contempt the extreme democratic provisions of the organic instrument which he had sworn to observe, and for the first year of his reign refused to take his advisers from the majority. In his plan for destroying the national Constitution, he was certain of the active co-operation of the Russians, of the well-wishes of Austria, and of the neutrality of Germany. The support of the civil, military, and clerical oligarchies, which the Liberal party had effectually estranged, was of indispensable assistance. In the country districts a considerable degree of popular animosity against the administration was already in existence, which was skillfully worked by the electioneering agents of the Prince and his Russian allies, in the extraordinary election which was to decide the fate of the national Constitution. Military tribunals were constituted by the Prince's edict to try any officials who should exert their influence on behalf of Liberal candidates. By these courts-martial any Liberal could be arrested, and even condemned to death. Two of the Liberal leaders, Zankoff and Slaveikoff, were arrested before the election, and, when released after a short confinement, were forbidden to go to Sofia or Tirnova. A Russian officer was placed in every election district as a commissioner, and a large number of others were detailed as sub-commissioners of elections. The diplomatic agent of the Russian Government, Nitrovo, was the active lieutenant and principal adviser of the Prince. Peasants were brought into the cities to vote, and carefully guarded from the allurements of the Liberals by the military. Bands of peasantry were encouraged to attack and maltreat any Liberal who was too outspoken. In the towns the election was conducted with scarcely the pretense of legality. Voters were kept from approaching the urns by the soldiery. In some cases crowds of electors collected about the polling-places, and

clamoring for their right to vote, were dispersed by a charge of bayonets. By corruption, violence, and intimidation, and frauds of every kind, a majority was obtained in most of the towns. One or two of the Liberal strongholds were declared disfranchised on account of disorders. Such means did not fail to furnish a subservient popular convention, more illiterate, however, than the Assembly complained of. The Great National Assembly, thus composed, assembled at Sistova, and accomplished the usurpation of Alexander by their vote annulling the Constitution, on the 13th of July.

BURCH, JOHN C., born in Jefferson County, Georgia, October 21, 1826; died in Washington, D. C., July 28, 1881, of organic disease of the heart. His parents were Georgians, and with them he resided in Fayetteville until 1862. Having received a preparatory education in his own State, Mr. Burch entered the freshman class of Yale College in 1843, and graduated in 1847. He then returned to Georgia and studied law in the office of Governor Charles J. McDonald, of Marietta, one of the most eminent jurists of the State. In 1849 Mr. Burch was admitted to the bar, and opened an office at Spring Place, Murray County, where he remained three years, and then removed to Chattanooga, Tennessee. Here he established a successful practice, and in 1855 was elected to the General Assembly as the member for Hamilton County. The House of Representatives, in which he served, was equally divided in politics, and, though one of the youngest members, Mr. Burch took a foremost place as debater and parliamentarian, and was one of the recognized leaders of his party. The session was a long and important one, in which Know-nothingism figured as a new phase in politics. In the debates and discussions growing out of that issue Mr. Burch achieved State-wide reputation, and in 1857 was elected Senator from the district composed of Hamilton, Bradley, Rhea, Bledsoe, Sequatchie, and Marion Counties. Though barely of senatorial age, he was chosen Speaker of the body. In 1859 the Nashville "Union and American," the organ of the Democratic party of Tennessee, lost its leading editors—Messrs. Poindexter and Eastman—and, acting under the counsel of the party leaders, Mr. Burch assumed the editorship of the paper, which duty he performed during the presidential campaign of 1860, and the critical agitation which culminated in civil war. After the fall of Fort Sumter he enlisted as a private in Company C, Rock City Guards, but was soon after chosen lieutenant of another company. Before going into the field, he was appointed aide-de-camp to Major-General Gideon J. Pillow, then in command of the Provisional Army of Tennessee, which was organized to support the army of the Southern Confederacy. He was soon promoted to the office of lieutenant-colonel, and when Tennessee became a member of the Confederacy he was made assistant adjutant-general, and continued in that

capacity during the war, serving on the staffs of Generals Pillow, Forrest, and Withers. At the expiration of the war he returned to Nashville, and resumed the practice of law until September, 1869, when he purchased a controlling interest in the "Union and American," and again became its editor-in-chief. In 1873 he was appointed by Governor J. C. Brown Comptroller of the State of Tennessee. This service was rendered with great ability and rigid integrity, and upon retiring from it he returned to journalism, in which he continued until 1879. On the accession of the Democratic party to the power of the majority of the United States Senate, Colonel Burch was elected secretary of that body over a number of formidable competitors, each of whom was an ex-member of the United States Senate or House of Representatives, and this position he held at the time of his death.

BURNSIDE, AMBROSE EVERETT, born at Liberty, Indiana, May 23, 1824; died at Bristol, Rhode Island, September 13, 1881. In 1843 he was appointed from Rhode Island to the United States Military Academy, where he graduated in 1847, and was made brevet second-lieutenant of the Second Artillery. During the war with Mexico, 1847-'48, he served at the city of Mexico, and received his full commission as second-lieutenant. In 1848-'49 he was stationed at Fort Adams, Newport, Rhode Island. Engaged on frontier duty at Las Vegas, New Mexico, in 1849-'50, he took part in a skirmish there with Iacarillo Apache Indians, August 23, 1849, receiving a wound. From April, 1851, to March, 1852, he was with the Mexican Boundary Commission, acting quartermaster. On December 12, 1851, he was commissioned as first-lieutenant, and on returning from New Mexico he was again stationed at Fort Adams, Newport. Having invented a breech-loading rifle, he resigned from the army October 2, 1853, to engage in manufactures, and pursued that business in Bristol, Rhode Island, from 1853 to 1858. In the year 1856 he was appointed one of the Board of Visitors to the United States Military Academy. During his residence in Rhode Island he was active in the militia, and from 1855 to 1857 he held the rank of major-general. Finding the business of manufacturing arms unsuccessful, General Burnside became cashier of the land department of the Illinois Central Railway Company in 1858, and removed to Illinois. In 1860-'61 he was treasurer of the same corporation. When the civil war broke out, he at once tendered his services to the Union, and was appointed colonel of the First Regiment of Rhode Island Volunteers, which marched to Washington four days after the President's call for troops was issued. At the first battle of Bull Run he commanded a brigade, and was soon after made brigadier-general. In command of an expedition to North Carolina in January, 1862, he captured Roanoke Island, Newbern, and Beaufort. At the close of the campaign on the Peninsula he was re-

called and ordered to Fredericksburg. There he remained until General Pope was defeated at the second battle of Bull Run. In March, 1862, General Burnside was commissioned major-general of volunteers, and during the Confederate invasion of Maryland he was under General McClellan's command. At the battle of Antietam he commanded the left wing. On November 10, 1862, he took command of the Army of the Potomac, superseding General McClellan, which position he retained until January 26, 1863. In 1862 the State of Rhode Island presented to him a sword of honor in testimony of his services at Roanoke Island. While in command of the Army of the Potomac he moved from the Rapidan to Fredericksburg on the Rappahannock, with a view to crossing the river at that point and moving thence upon Richmond. General Lee, however, took possession of the heights on the opposite bank before Burnside was ready to cross, and when, on the 12th of September, the Union forces crossed and endeavored to break the Confederate lines, they were repulsed after repeated attacks. For this movement he was severely criticised by several officers of high rank, whose removal he requested, tendering his resignation of the command if his request was not complied with. His resignation was accepted, and General Hooker succeeded him. In the following March he was in command of the Department of Ohio, and soon after assuming this position he arrested C. L. Vallandigham on account of his defiant utterances. The pursuit and capture of Morgan's raiders also occurred while he had charge of this department, soon after which General Burnside undertook to drive the Confederates from East Tennessee; in this he was successful, and for it received the thanks of Congress. Late in September, 1863, the Ninth Corps, which had been detached from Burnside's command, was restored to it. In the mean time General Lee had sent General Longstreet to Tennessee with a strong force from Virginia. Burnside fell back to Knoxville, where he was besieged until the beginning of December, when the siege was abandoned on the approach of General Sherman with a detachment of General Grant's army. Burnside was then relieved from his command in the West, and in January, 1864, was restored to that of the Ninth Corps, with which he followed Grant over the Rapidan—Grant crossing May 4th and Burnside May 5th. The battles of the Wilderness, Spottsylvania, and North Anna succeeded—the corps being now attached to the Army of the Potomac, under the immediate command of General Meade, Burnside waiving his seniority in rank. His corps was prominent in subsequent operations down to the siege of Petersburg. During the early part of this siege, Burnside's lines were close to those of the enemy, and opposite them was a strong redoubt forming an important part of the Confederate defense. Beneath this work General Burnside caused a

mine to be run, and blew it up on the 30th of June; but the general assault, which had been planned to follow, was not made, and the affair was a failure. Burnside then proffered his resignation, which was not accepted, but he was granted leave of absence, and not being recalled to active service he resigned April 15, 1865. As an officer he was much loved by his subordinates. After his retirement General Burnside was engaged in business in Rhode Island, having been a director in the Illinois Central Railroad Company, the Narragansett Steamship Company, and President of the Cincinnati and Martinsville Railroad Company, of the Rhode Island Locomotive Works, and of the Indianapolis and Vincennes Railroad Company. In 1866 he was elected Governor of Rhode Island, and was afterward honored with two re-elections. In 1869, before the expiration of the third term, when he was asked for the use of his name again, he publicly announced that he would not be a candidate for re-election. The following year he visited Europe, and was admitted within the German and French lines in and around Paris, acting as a medium of communication between the hostile nations, in the interests of conciliation. On his return home he was again summoned to public duties, being elected to the United States Senate as successor to ex-Governor William Sprague. When a similar election was required he was again chosen, and had entered upon his second term at the time of his death.

General Burnside resided periodically in Providence and Bristol, the latter being his summer home, and it was here that he entertained General Grant in the summer of 1875. He died without family, his wife having closed her life in March, 1876. In the hearts of his friends and associates General Burnside's memory is preserved with the kindest respect; the people of his State admired and trusted him, and the veteran soldiers delighted to honor the veteran leader on many a hard-fought field.

BURNSIDE, JOHN, born in Ireland; died June 29, 1881, at Greenbrier, White Sulphur Springs, Virginia. Mr. Burnside was at the time of his death one of the few millionaires in the South, and the largest sugar-planter in the United States. His reticence concerning his age leaves that point to conjecture, but it is supposed by his most intimate friends that he must have been at least seventy-eight when he died. Like many other men of large fortune in America, Mr. Burnside commenced life in extreme poverty, and from filling the humble position of clerk to Mr. Andrew Beirne, a merchant in Fincastle, Botetourt County, Virginia, he gradually acquired such importance with his employer as to be made by him the partner of his son in a wholesale dry-goods house at New Orleans. During a great financial panic, Mr. Burnside and his partner had the nerve to extend credit when other merchants refused all risks. In this way the firm of Beirne & Burn-

side spread their business to the farthest points of the South, and laid the foundation for their remarkable future prosperity. Subsequently Mr. Burnside associated himself with another firm under the title of Burnside & Co. About 1852 he began to make investments in sugar-plantations, first among which were those known as Hounas and Orange Grove, for which he paid \$1,000,000. At the time of his death he owned ten of the most highly cultivated and best improved plantations in Louisiana, the value of his possessions being estimated at between \$4,000,000 and \$5,000,000. At the time of the war he owned 2,200 slaves, but, notwithstanding his heavy loss by their emancipation, he continued to accumulate wealth in the dry-goods business, from which he virtually retired in 1857. He was never married, and it is thought he had no relatives in this country. Among the distinguished guests whom he entertained were the Grand Duke Alexis, Dom Pedro, and General Hancock. Although not

noted for his public spirit, he was given to personal charities that he carefully concealed from the world, and in his own way he contributed largely to the prosperity of his immediate community. He was one of the first to try planting with free labor on an extensive scale, and his eminent success in the venture induced others to follow his example with similar results. Mr. Burnside kept constantly in his employment between two and three thousand persons, who were promptly and liberally paid. His money was spent chiefly in Louisiana, and his annual expenditure in New Orleans amounted to \$300,000 in the purchase of plantation supplies. At the time of his last sickness he was arranging to have built on his plantation in Ascension a sugar-house to cost \$100,000. According to the sugar report for the season of 1879-'80, the plantations now included in his estates produced 5,373 hogsheads of sugar and 9,074 barrels of molasses, valued at about \$600,000.

C

CALIFORNIA. The twenty-fourth session of the Legislature of California commenced on January 3d. In the Senate, Lieutenant-Governor Mansfield took the chair, and William M. Johnston, of Sacramento, was chosen President *pro tem*. In the House, William Henry Parks, of Yuba, was chosen Speaker. The session was continued sixty days, as provided in the Constitution of the State, and adjourned on March 4th. More than eight hundred bills were introduced, but only fifty-one received the signature of the Governor. It was anticipated that the new Constitution would shorten and simplify legislation. It contains a provision against special legislation, and on this ground the length of the session was limited to sixty days. These anticipations were disappointed.

Among the measures considered was the repeal of the *débris* act of the previous session. This was defeated. The nature of the injury for which a remedy was sought in the passage of the *débris* bill was briefly stated in the "Annual Cyclopaedia" of 1880. It arises from the effects of hydraulic mining, and has, thus far, most seriously occurred on the American, Bear, and Yuba Rivers. It consists in a practical burial of large areas under the mining detritus or "slickens" and sand. The property so buried is, in fact, so completely deprived of agricultural value that in the opinion of competent judges it can under the most favorable circumstances be fit for nothing but raising swamp timber for from fifteen to thirty years. As to the extent of the damage done in this way, the State Engineer, in his latest report, declared that he believed the destruction which might be classed as direct in the loss of agri-

cultural property could with safety be estimated as follows:

Landed property.....	\$4,000,000
Improvements.....	2,000,000
Total.....	\$6,000,000

The indirect damage to property is most apparent along the main streams—the Feather River, and the upper and lower Sacramento River. For the most part, the difference between direct and indirect damage to property is more in the degree of harm inflicted than in its character. This, however, is not invariably the case. The settlers along the lower Sacramento have, for example, expended millions of dollars during the past fifteen years in attempting to reclaim swamp and overflowed lands. The failure which has followed these courageous and spirited efforts must be ascribed to the constant operation of those natural forces which the processes of hydraulic mining put in motion, and which from year to year have been counteracting and nullifying the most determined attempts at reclamation. The State sold the swamp-lands on the condition that they should be reclaimed, and should remove obstacles which render the fulfillment of the conditions thus imposed by it impracticable.

The indirect injuries which may be traced without any doubt or difficulty to hydraulic mining are, however, very extensive. In all these cases the future can be predicted from the past. On the one hand are lands already covered with the flood of sand and *débris*. On the other hand are lands threatened with this flood. And the flood is continually advancing. The low lands of the whole Sacramento Valley

are, in fact, threatened with unavoidable destruction. That is to say, an area inclosing from twelve to fourteen hundred square miles of fertile territory is indirectly damaged, and is menaced with ultimate destruction.

Nor is this the whole of the situation, for the injury done to the Sacramento Valley extends, by a reflex action, to the low lands of the San Joaquin, and to the lands about the upper bays by a direct movement. It may, therefore, be said without exaggeration that the indirect damage actually embraces an area extending from Oroville and Chico to Benicia on the Strait of Carquinez.

It is necessary to bear in mind that the destruction of the navigability of the Sacramento River is involved. This would deprive the whole of Northern California of competition in transportation. The wheat-crop alone of that region may be estimated at five hundred thousand tons. It may also be fairly calculated that the removal of competition would result in a rise of freight-rates to the extent of \$2 per ton. Thus, then, an additional tax of \$1,000,000 a year on the movement of the harvest alone is involved in this question, as concerns Northern California. An illustrative instance of the influence of river improvements on freight-rates is to be found in the effect produced by deepening the channel at the mouth of the Mississippi. The competition offered by that river after the opening of its mouth reduced the aggregate freight charges on the first year's products of the Mississippi Valley \$50,000,000.

Taking the counties of Colusa, Placer, Sacramento, Solano, Sutter, Yolo, Yuba, Butte, and Tehama, and estimating the assessed value of the real estate other than town lots, and the improvements, and of the town lots and their improvements, and making what seems a sufficient deduction from the aggregate, it is estimated that the property in these counties threatened with partial or complete destruction can not properly be put at a lower amount than \$60,000,000.

The evidence furnished by the State and consulting engineers shows that the water-ways are in danger of destruction, and that, unless sustained and systematic treatment is applied to the rivers, they will shortly cease to be navigable, and that both the Feather and Sacramento Rivers are in a condition in which an unusual flood might cause them to abandon their present channels, and spread themselves abroad through the low lands between Knight's Landing or Grey's Bend and Suisun Bay, ruining the country everywhere, and changing the very face of the State.

Apart from the burden that would fall upon the northern region of the State by the removal of the means of competition by the rivers, this injury would affect a population of at least one hundred and fifty thousand, of whom one third would be directly and two thirds indirectly concerned. The effect upon the value of land can not be ignored. It is evident that

if through any cause the cost of transportation is raised two dollars a ton, the products of the region so affected must by this change be put at an increased disadvantage equal to the removal of their lands from a market a distance represented by the enhanced ratio of transportation. Their lands are in fact thereby put as much farther from the market as two dollars will carry a ton of wheat, and the consequence must be to lower the value of land exposed to such an impost.

An approximate estimate of the loss of values to be apprehended in this direction from the destruction of the principal water-ways can not be fairly stated at less than \$100,000,000.

This leads to a statement of the value and importance of hydraulic mining, which is the cause of the present and prospective damage to the State. This mining has been carried on for twenty-five years, and the present annual output of the hydraulic mines is estimated at from \$12,000,000 to \$14,000,000. It is therefore apparent that an estimate of \$150,000,000 for the whole period of their working is not extravagant. It is equally clear that while no accurate estimate of their future output can be made, it is safe to assume that it will be larger than it has been in the past, since the extent of gravel-bearing claims remaining unworked is practically unlimited, and since many very extensive workings have either just been opened or are not yet opened so as to be largely productive. Enough is known to make it plain that the hydraulic mines have contributed greatly to the prosperity of the State, and will contribute still more largely in the future, if suffered to proceed. A very considerable population is supported by these mines, estimated at 30,000, and the indirect support is very much more extensive. The counties in which the principal hydraulic mines are situated may be said to depend almost entirely upon the mining industry. All values in those counties are therefore dependent upon the prosperity of this interest. What this involves may be perceived by reference to the comprehensive decline of values in Virginia City consequent upon the depreciation of the mines on the Comstock lode. In that case the mining population was thinned out, the value of real property fell to panic prices, and the general effect upon the prosperity of the community was as disastrous as though every man in the city had been directly interested in the mines. Similar results must always follow where the intimacy of the relations between the various interests is as great as in the mining counties of California. The suppression of hydraulic mining, therefore, would in all probability be productive of a general collapse throughout this region. Not only would there ensue a positive and direct loss to the State in the cessation of aniferous production, but the entire industries, commercial activities, and general civilization of the mining counties would be virtually destroyed, and the tax-paying as well as the wealth-producing

capacities of those counties would be paralyzed. It is, however, evident that the hydraulic mining interest is an important one. It may be said, as regards its annual output, to represent a fixed capital of \$100,000,000, and directly and indirectly it affords support to a considerable population. Even the farmers in the valley, who occupy lands on the verge of the mineral area, owe a portion of their prosperity to these mines, which create a brisk demand for their produce, and a demand the loss of which would be severely felt.

The engineers were required to ascertain the extent of the injury, present and prospective, and whether remedial measures were available. Their reports have shown that the extent and gravity of the damage and menace are far greater than had been commonly supposed; that it was possible to counteract the ill effects of hydraulic mining by a systematic treatment of the rivers; that such a systematic treatment of the rivers was necessary in any case, since it would be impossible to meet the exigencies of the situation by merely stopping hydraulic mining.

The most formidable danger to the low lands is due to the deposit in the mountain-streams and tributaries of enormous quantities of heavy sand, which is being washed down lower every year. The deposit of this sand must continue until the entire Sacramento Valley is covered and destroyed, even though hydraulic mining should be stopped at once, until remedial measures are adopted. In fact, it may be asserted that the stoppage of hydraulic mining in the present stage of the *débris* evil would produce no alleviation whatever. There is a mass of mining *débris* now collected in the cañons of the mountains sufficient to cover the Sacramento Valley completely a couple of feet deep, and this matter will continue to be washed down every winter until the beds of the river are entirely choked, and until the destruction inflicted upon the valley agricultural lands has become past relief or reparation.

The surveys of the engineers resulted in ascertaining the practicability of remedial measures, but at the same time showed that the subject was too extensive to be dealt with locally. It was particularly insisted on by the engineers that sustained and systematic treatment of the rivers must be undertaken, or that it would be useless to attempt anything. While, therefore, they held out the encouraging consideration that by such a systematic treatment the condition of the rivers might be made even better than it had ever been, they contended that nothing less comprehensive than the methods they proposed would be adequate. It was estimated by the engineers that the expenditure required for the construction of suitable works could not exceed \$10,000,000, and that it might not exceed \$5,000,000. What was known as the drainage bill was prepared and passed at the previous session of the Legislature. This act levied a benefit assessment upon the

districts to be aided; the hydraulic miners were called upon for extra contributions, and a tax of five cents on the hundred dollars was made general throughout the State.

A large portion of the session of the Legislature was occupied in the discussion of the bill to repeal the act, which, however, was defeated on the first reading in the Assembly.

The plans of the engineers embrace a system of levees and cut-offs for the lower course of the Sacramento, and a system of dams for the upper course. It has never been pretended that the dams without the levees, or the levees without the dams, would bring about the results aimed at. But the works have only been commenced a short time, and the dams alone have been constructed. No engineer has claimed that the dams were capable by themselves of effecting a cure for the evil attacked. On the contrary, all the engineers have agreed that before any real relief can be had, the levees must be made strong enough to carry the flood-waters of the river without giving way. During the past winter no real test of the engineering plans was possible, inasmuch as they were incomplete. Such a test can not be applied until the lower river has been leveed scientifically—and this is not the work of a few months. The brush dams, however, have been so successful in holding back the heavier *débris*, that the efficiency of that kind of work can not be questioned seriously. The inundation of the Sacramento Valley does not show that the engineers made any mistake, for no steps had been taken to prevent such an inundation. The floods found no obstacles but the old and thin and insufficient levees which had been built piecemeal here and there, and as a matter of course they soon overcame those frail barriers.

The report of the Board of Equalization presented the first trustworthy data for ascertaining the results of the revenue system put in operation by the new Constitution. Its framers believed that a great deal of property had escaped taxation in the past, and they were determined to make everybody pay in the future. They imagined that this could be done by decreeing it, and so resolute and unflinching were they in the prosecution of their purpose that they refused to exempt from taxation even the shadows of property, but insisted that everything which represented property should be assessed. It happened coincidentally that there prevailed a belief that land monopoly could be put an end to by taxation, and to this end it was agreed that cultivated and uncultivated land, of the same character and quality, should be assessed at the same rate when in contiguity. The taxation of mortgages, the taxation of credits and stocks, the taxation of uncultivated land at the same rate as cultivated, was to lighten the burden of taxation on the masses by forcing the rich to bear their just share of the general load. How the new system succeeded, the State

Board of Equalization tells. For it has been shown in the report that the ways in which taxation is escaped are more numerous than ever before; that while personal property has always evaded assessment, real property has now found it possible to follow the same course; that the attempts to impose double taxation have in a large number of cases been eluded by resort to shifts which resulted in the loss of even single taxation; that the endeavor to break up land monopoly, by taxing uncultivated lands at the same rate as cultivated, has operated as a raid upon the small farmers; that owing to the exemption of growing crops from taxation, and the failure to provide for the assessment of the mature crops, this important class of personal property largely escapes taxation; that owing to the ambiguities and confusions of the new Constitution, the Board of Equalization has been prevented from equalizing assessments generally; that under the new system the State is at the mercy, first of the assessors, secondly of the tax-payers; that whether the assessments are made by the first or the second, the interests of the State appear to be equally subordinated; and it is apparent that some three or four hundred millions of property continue to pay no taxes whatever.

The board wants some provision which will render the assessors intelligent or conscientious. That they are not so at present the board thinks itself bound to conclude from the manner in which real estate has been assessed. With a unanimity and a perversity seldom equaled and never surpassed, the assessors have reversed the new constitutional rule in regard to cultivated and uncultivated land, and have in practice evidently assessed the former by the latter. But the most remarkable result of all is the graduation of the assessments in accordance with the increase in size of the farms. Everywhere the small farm has been assessed higher than the large one. In every county the value per acre of ten, twenty, and fifty-acre farms has been rated higher than that of the hundred, two-hundred, four-hundred, and six-hundred-and-forty-acre farms. The fact remains that the new rule has thus far failed, and it is to be ascertained whether the principle underlying it, or the method of appointing assessors, is most at fault. In regard to the latter, it must be admitted that thus far the plan of electing these officers has not resulted well for the State. It is notorious that property of all kinds escapes assessment.

A bill to authorize a commission to act on the subject of the adulteration of food and medicines was introduced in the House and referred to the Committee on Epidemics and Diseases. Their report presented an alarming state of affairs, of which the following statement contains some details:

The extent to which poisonous adulteration appears to be carried on in the United States is such that it would hardly be an exaggeration to say that

murder had become one of the commonest incidents of trade and manufacture. Nothing can be more horrible than the cold indifference to consequences with which manufacturers of all kinds appear to employ deadly and noxious materials. We are forced to conclude that there are in this country thousands upon thousands of men who are perfectly willing to spread death and disease broadcast over the community if in so doing they can make a little larger profit. Swindling, cheating, substituting bad and sham for good and genuine materials, are methods so usual as to be almost the rule. Adulterations enter into almost everything that is eaten, that is drunk, that is worn, that is used. And disease and death go hand in hand with adulteration everywhere.

Our children are poisoned by the dye-stuffs used upon their dresses and their stockings. The candy they eat is poisoned. The papers which we put on our walls are poisoned. The cards which we use in visiting or for social purposes are poisoned. The artificial flowers our wives and daughters employ are poisoned. The bread we eat is poisoned. The baking-powders, of which some two hundred kinds are on the market, are nearly all poisonous. The pickles which we put upon our tables are deadly. Our coffee, our tea, our sugar, our butter and cheese, all our canned goods are poisoned. Our candles, our oils, the cosmetics our women use so freely, are full of danger. The toys, the puzzles, the block maps, which we put in the hands of our children, may carry destruction with them. And as for the medicines with which disease is to be warded off, there is scarcely a genuine drug to be had anywhere.

The attention of the Legislature was so engrossed with the drainage act that little time remained for the consideration of many other important measures; consequently a final adjournment took place on March 4th, under the provisions of the Constitution. No appropriation bill was passed, nor an apportionment bill. The latter was required to conform to the returns of the recent census. So much important business remained to be considered, that the Governor, on March 24th, called an extra session of the Legislature, and appointed April 4th as the day on which it should commence. The objects of this session were:

1. To enact a general appropriation bill, which shall contain no item or items of appropriation other than such as are required to pay the salaries of the State officers, the expenses of the government, and of the institutions under the exclusive control and management of the State, for the thirty-third and thirty-fourth fiscal years.
2. To levy the rates of taxation, or, in the discretion of the Legislature, to provide that the State Board of Equalization shall fix such an *ad valorem* rate of taxation upon each one hundred dollars of taxable property of the State, which, after allowing the per cent required by law to be allowed for delinquencies in and cost of collection of taxes, shall be sufficient to raise the specific amount of revenue determined upon and directed to be raised by the Legislature for the thirty-third and thirty-fourth fiscal years.
3. To appropriate money to pay the deficiencies in appropriations for the support of the civil government of this State for the thirty-first and thirty-second fiscal years.
4. To divide the State into senatorial, assembly, and congressional districts.
5. To enact a general road law.
6. To send appointments to the Senate for their confirmation.

The extra session commenced on April 4th. In the Senate, the first business was the adop-

tion of a resolution to proceed to the election of officers for the session, by a vote of 19 to 14. The House assembled at the same time, and the Speaker chosen at the previous session took the chair. A point of order was raised, that the House was not organized. The Chair held the House to be regularly organized by its officers all being in place as elected at the opening of the regular session. A motion was made to notify the Senate of the organization of the House. A substitute was offered to this motion, that the House proceed to organize by electing certain officers. On a point of order raised, the Chair ruled the motion by way of substitute out of order. The House, if not organized, can not entertain the motion under the prevailing organization. If the House had desired to organize over, it could have done so at twelve o'clock, and, if it should have done so then, the Speaker is a usurper. However, by consent, debate would be heard on the resolution. The following proceedings then took place:

Mr. Kellogg argued that the officers do not hold over; that an extra session, so far as officers are concerned, is a new Legislature, as they are elected not for a legislative term, but for the session.

Mr. May held that the officers hold over, and thought there could be no doubt of it. This is the twenty-fourth, not the twenty-fifth Legislature. There is no precedent that the officers lose place by adjournment *sine die*, except at the end of the term. The Senate re-elected this year, but it was a new Senate, although composed of the same men as in the twenty-third Senate.

Mr. Freer held to the same views, and said the adjournment *sine die* was adjournment without day, but that did not cut off the terms when a day is given for reassembling. He read from Cushing's "Elements" in support, and additional sections, showing that the clerks hold (until removed by resolution) for the entire term for which the Legislature is elected. He opposed reorganization because it would cause delay and be revolutionary in character.

Mr. Griffiths favored reorganization. He cited the journal of the House of Louisiana, March, 1878, then convened in extra session, where the officials were retained by resolution regularly passed. Also journal of the Iowa House, January, 1882, in extra session, where, by resolution, the old officers, so far as deemed necessary, were reappointed. Also journal of the Senate of Illinois, 1867, in extra session, when by resolution certain officers were chosen. Also journal of the House of Indiana, 1872, extra session, when the House entered into a new election. He said if any doubt was left as to the matter, it might involve the laws passed, and so a reorganization had better be had. There might also be officers who can be dispensed with.

Mr. Young had at first thought adjournment *sine die* dissolved the organization, but on examining the law he had come to the settled conviction that he had been in error. Adjournment is a term somewhat confused in some minds; adjournment is not prorogation, not dissolution. The members-elect constitute the Legislature, even when not in session, and hence the power given in the Constitution to call the Legislature together after adjournment, thus recognizing the existence of the body, though not in session. He cited Cushing's "Law and Practice," section 196, in support.

The motion by way of a substitute was lost, yeas 17, nays 47; and the original motion to notify the Senate of the organization of the House was adopted, yeas 36, nays 28.

This extra session continued until May 14th. The bill for the apportionment of the State into election districts failed to pass. Many efforts were made to legislate on subjects not embraced in the proclamation of the Governor calling the session. The time of the Legislature was thus unnecessarily occupied, and some important measures failed to pass.

The report of the Railroad Commissioners was a clear statement of the difficulties encountered by them, and of the conclusions forced upon them by the study of the transportation question. They discovered, before they had been at work long, that it was impossible to regulate freights and fares in an arbitrary and sweeping way without producing far greater evils than any heretofore alleged to exist. They found also that to regulate transportation charges on any other principles than those which were already in operation, would necessitate an entire reorganization of the whole business, and would demand a knowledge and a capacity such as that business has never developed yet in any country, notwithstanding its employment of the most acute intelligences. There were but two methods of procedure open to them. They might pander to the unreasonable demand for a sweeping reduction of charges, with the certainty that in so doing they must injure the public quite as much as the railroads; or they might follow out the principles already established, and endeavor, through them, to reach results which would benefit the public without injuring the corporations. They have chosen the second of these courses.

They point out, in vindication of their decision, that no commission appointed for similar purposes has ever yet been able to arrive at any other general conclusion; that every attempt to deal violently with the problem, and to adjust it by sheer force, has failed disastrously; that every such failure has involved serious injury to the public interests; and that the unavoidable deduction from all existing experience in this direction is, that equitable and reasonable methods are the only ones which can produce beneficial results. The commissioners dwell upon the importance of understanding the principle of the maximum in transportation. They quote the maxim that high maximum means low minimum; they show that this is the secret of successful transportation; that, in fact, it is only possible to provide for the carriage of low-priced staples at minimum rates by fixing the rates on high-class merchandise correspondingly high.

The report of the Assembly Committee of the Legislature on Prisons is more of a general survey of the most important conclusions reached by experiment in all parts of the country, than a presentation of the features of the system in California. It shows that the question of the disposition and treatment of convicts is undergoing more and more radical changes, and that the old views and ways are

being discarded wherever the existing institutions render it practicable to introduce reforms in prison management. It is now recognized by all who have examined the subject that every prison ought to be at least as much a reformatory as a place of confinement; that the reformation of criminals can only be undertaken hopefully by such methods as give the convicts definite desirable objects, which they may attain by their unassisted efforts; that rewards and punishments are the necessary groundwork of any such system; that it must be applied by men specially fitted for the work, and who ought to have undergone a distinct training in penology. It is also beginning to be believed that when the sentence of the prisoner is indeterminate—that is, left to be decided by his own conduct—the prospect of reformation is much greater than under the old method, since the prisoner is thus afforded hope without restriction. The Crofton Prison system, and those which have grown out of it, all tend more and more toward reliance upon the prisoner himself, and this is evidently the scientific mode of procedure. For, if a man who has fallen into evil courses is to be reclaimed, it is clear that he must determine to help himself, and that, no matter what assistance he derives from without, all the really useful action must come from within.

It has been found that by appealing to men's self-respect, and by treating them as though they were by no means irreclaimable, the latent ambition, the slumbering conscience, the paralyzed manhood, can be stimulated and given new life, and that the reformations wrought by these means are practically the only ones which are permanent. It is important to observe that economy goes hand-in-hand with humanity. Not only is it right to attempt the reform of the criminal, but it is to the interest of the public Treasury to do so. Crime is waste, in all its forms, and our old systems of dealing with it have been as wasteful as itself. "In fact, we have only continued to give crime a fixed abiding-place and a central rallying-point, and there can be no doubt that our jails and State prisons have made ten times more scoundrels than they ever cured. To alter all this in accordance with the new lights is not only to rid the community of its most dangerous elements, but to prevent the revival of these elements, and at the same time to make crime largely self-sustaining in the prisons."

By the new Constitution of the State the management of the State prisons is vested in a board of directors. Five persons were appointed by the Governor in 1830. Subsequently charges of a serious character were made by the public press reflecting upon the board of directors and the warden of St. Quentin's Prison; whereupon these officers requested the Governor to appoint a commission to examine into the general management of the prisons. This commission made a report in August, which contained some important statements

relative to the general management of penal institutions. It was subsequently followed by a prison-reform convention, at which important papers were read and questions discussed.

The Drainage Act of the Legislature, for the repeal of which a protracted and unsuccessful effort was made at the last session, was finally declared to be unconstitutional by the Supreme Court of the State. The principal grounds of objection to the act were that it provided for other purposes than those which are specified in the title, and that it established double taxation, and delegated unconstitutional powers to local boards. This decision was final.

The progress of the State has been of the most substantial character. Banks of issue being prohibited by her Constitution from the beginning, and even when the national currency was adopted and made legal tender by Federal law, the feeling against paper money of any kind was strong enough to maintain the gold standard all through the war, and through the era of inflation which followed it. California, consequently, did not feel the seeming prosperity attendant upon the great rise in nominal values which took place in the East as the currency depreciated, and she also escaped the inevitable reaction which came with the appreciation of the currency and the fall of prices. Yet the State did not escape the effects of the failure of some of the most productive mines and a consequent shrinkage of values. This was strikingly manifested in stock values, the highest prices of which were reached in January, 1875, and is shown by the following table:

Aggregate value of mining stocks on San Francisco board, January, 1875.....	\$232,305,404
Aggregate value of mining stocks on San Francisco board, July, 1881.....	17,902,700
Shrinkage.....	\$264,402,704
Highest value consolidated Virginia, January, 1875.....	75,600,000
Value consolidated Virginia, July, 1881.....	945,000
Shrinkage.....	\$74,655,000
Highest value California, January, 1875.....	84,240,000
Value of California, July, 1881.....	851,000
Shrinkage.....	\$83,889,000
Highest value Sierra Nevada, September, 1873.....	27,000,000
Value of Sierra Nevada, July, 1881.....	825,000
Shrinkage.....	\$26,175,000

It should be remembered that the famous Comstock mine did not reach its maximum until 1877, that in twenty years it yielded three hundred million dollars, and that it dropped nearly thirty-three millions in three years.

The tendency of gold-mining to assume a stable character is shown by the annual steadiness of the crop. The great improvements which have taken place in mining machinery and methods now enable the working with profit of low-grade ores, of which there are regular and enormous deposits. How mining of this kind is developing is shown by the fact that the foundries of San Francisco during the year have turned out machinery for over a thousand stamps. The injunctions which have

this year suspended the operations of some of the principal hydraulic mines of California may lessen by some millions the gold-harvest; but the movement to restrain the hydraulic miners from washing their tailings into the valleys, where they fill up the beds of the streams and destroy agricultural lands, is in itself an evidence of a growing conservatism of feeling—of the increasing disposition to look upon California as a country in which permanent homes are to be made. In the agricultural capabilities of her soil lie the possibilities of her greatest wealth. The wheat-crop of last year, after supplying all home demands, including that of distilling, gave a surplus for export of no less than 1,400,000 tons—a surplus worth, even at the low rates that prevailed on account of the scarcity of tonnage, \$37,500,000, or more than twice the whole bullion product of the State. Or, in other words, the wheat-crop of California for 1880 was worth more than half as much as the bullion product of the whole United States.

Among the most valuable of her industries in the future will be those of the vineyard and the orchard. The natural adaptation of the soil and the climate has been proved beyond a question. The grape-growers of the State can now sell their grapes with as much certainty as the farmer his wheat. There is now sent to the Atlantic coast more wine than is imported from France, and it is estimated that the wine-crop of last year yielded to the growers nearly \$3,500,000. The curing and packing of raisins has only recently commenced, but it is already an assured industry.

In San Francisco, in Alameda, and San José are fruit-canning establishments which, during the busy season, employ over a thousand hands apiece, and all over the State, wherever there is an important fruit district, this industry is rapidly developing. Orchards of the finer varieties of peaches, plums, pears, nectarines, etc., are being set out in all parts of the State, and in the southern section the culture of semi-tropical fruit is attaining large dimensions.

The question arising under the new Constitution relative to the taxation of certificates of stock by assessors of taxes was also decided by the Supreme Court. The opinion was delivered by Justice Ross in the case of *Burke vs. the Assessor*. He held that the Constitution of the State does not require or authorize double taxation. On the contrary, its language clearly prohibits it. The stock of any corporation consists of its franchise and such other property as the corporation may own. When, therefore, all of the property of the corporation is assessed—its franchise and all of its other property of every character—then all of the stock of the corporation is assessed, and the mandate of the Constitution is complied with. This property is held by the corporation in trust for stockholders, who are beneficial owners of it in certain proportions called shares, and which are usually evidenced by certificates of stock.

The share of each stockholder is undoubtedly property, but it is an interest in the very property held by the corporation, nothing more. When the property of a corporation is assessed to it, and the tax thereon paid, who but the stockholders pay it? It is true that it is paid from the treasury of the corporation before the money therein is divided, but it is substantially the same thing as if paid from the pockets of the individual stockholders.

At the presidential election in 1880, the official count of the vote was as follows:

Total vote.....	160,795
Hancock, Democrat.....	80,417
Garfield, Republican.....	80,373
Hancock's majority.....	35

The vote for members of Congress was as follows:

District.		
I.	Rosecrans, Democrat.....	21,005
	Davis, Republican.....	19,496
	May, Greenback.....	683
II.	Glasecock, Democrat.....	18,211
	Page, Republican.....	21,483
III.	Berry, Democrat.....	14,437
	Knight, Republican.....	11,082
IV.	Leach, Democrat.....	17,263
	Pacheco, Republican.....	17,328

The Legislature was divided as follows:

PARTIES.	Senate.	House.
Republican.....	25	41
Democrat.....	15	39
Total.....	40	80

The compilation of the returns of the census are so incomplete as to add nothing to the aggregate statistics of population in the previous volume.

CANAL, INTEROCEANIC. (See PANAMA CANAL.)

CAPE COLONY AND BRITISH SOUTH AFRICA. The present Constitution of the Cape Colony vests the executive power in the Governor and an Executive Council, composed of certain office-holders appointed by the Crown. The legislative power rests with a Legislative Council of twenty-one members, ten of whom are elected for ten years, and eleven for five years, representing the country districts and towns of the colony. The qualification for members of the Council is possession of immovable property of £2,000, or movable property worth £4,000. Members of both Houses are elected by the same voters, who are qualified by possession of property, or receipt of salary or wages, ranging between twenty-five and fifty pounds sterling per annum. There were 45,825 registered electors in 1878. The Governor is, by virtue of his office, commander-in-chief of the forces within the colony. He has a salary of £5,000 as Governor, besides £1,000 as "her Majesty's High Commissioner," and an additional £300 as "allowance for country residence." The administration is carried on under the Governor, by a ministry of five members, called the Colonial Secretary, the Attorney-General, the

Treasurer-General, the Commissioner of Crown Lands and Public Works, and the Secretary of Native Affairs.

The area and population of the several provinces were as follows at the close of 1880:

TERRITORIES.	Square kilometres.	Population.
Cape Colony.....	517,849	750,757 (1880)
Basutoland.....	21,794	128,176 (1875)
Griqualand West.....	45,800	48,123 (1877)
Transkei district (Caffraria). ..	40,834	409,944 (1878)
Natal.....	48,560	364,333 (1880)
Total.....	963,418	1,633,838

The distribution of the population, according to sex, in Cape Colony, inclusive of British Caffraria and Basutoland, and in Natal, was as follows in 1878:

TERRITORIES.	Male.	Female.	Total.
Cape Colony.....	480,529	418,631	849,160
Natal.....	176,766	184,521	361,587

The financial and commercial statistics for 1879 for Cape Colony and Natal were as follows:

FINANCES.	Cape Colony.	Natal.
Receipts.....	£5,661,000	£273,000
Expenditures.....	3,995,000*	491,000
Debt.....	10,017,000	1,632,000
Imports.....	7,664,000	2,176,000
Exports.....	4,083,000	554,000
Movement of shipping (in tons)...	1,532,000	412,000

At the close of 1878, 663 miles of railway were in operation in Cape Colony.

The Cape settlements are bound to Great Britain by looser ties of interest and sentiment than any of the other dependencies of the empire. The bond has not been strengthened by the cares and difficulties which they have given to every English administration, and the incessant loss of British blood and treasure in unpopular Caffre wars which the connection has entailed since the first annexation in 1812. More than two thirds of the Queen's subjects in South Africa are aliens in blood, language, and customs, while the commercial and military advantages of the connection bear no proportion to the sacrifices it has cost. For these reasons the home Government and the British public have long desired to see the plan of autonomous government and self-dependence realized in these troublesome dependencies. The complicated relations of the British Government with the Anglo-Saxon settlers, the Afrikaners, and the native populations, which under the management of ignorant military commanders and crown officials involved the commission of the numberless wrongs and cruelties of the past, still stand in the way of England's withdrawing her aid and authority from the Cape. The fixed idea of an administrative theorist, adopted as a practical policy for the consummation of this object, was one of the chief causes which led to the last three

years which have afflicted these ill-fated communities. Lord Carnarvon, after the happy effects of the confederation act in Canada became apparent, conceived the idea of uniting all the European settlements of South Africa under a similar confederate government, to which the virtual sovereignty should be transferred. This scheme was adopted as the traditional policy in Downing Street, and was enthusiastically pursued by the Queen's representatives at the Cape. The Transvaal was annexed by Sir Theophilus Shepstone in April, 1877, in a way which the people of Great Britain have only come to understand since the rebellion of the Boers. The usurpation was excused on the pretext that the people of the republic were misgoverned by their own authorities to such an extent that they hailed British rule with thanksgiving. Zoolooland was then invaded, with scarcely any pretext, for the object of rendering the Boers content with the annexation, and to remove a possible danger to the future confederation, and induce Cape Colony to join it by crushing the only organized and formidable native power in this part of Africa. This disastrous war, which cost £5,000,000 and thinned the ranks of British regiments, excited a strong repugnance in Great Britain to any further military operations in South Africa, although the entire responsibility for the Zooloo campaign lies at the door of the Imperial Government. The people of Cape Colony, who had possessed responsible government since 1872, were given to understand that for the future they must undertake their own defenses. Thereupon the colonial ministry under Mr. Sprigg instituted a course of arbitrary policy entirely in the spirit of Sir Bartle Frere's Zooloo stroke.

The Basutos of Basutoland, a laborious, pastoral, and agricultural people, who were becoming rapidly civilized and Christianized, populous and wealthy, had the custom of buying every man a gun. They never took their fire-arms from the wall except on one or two occasions, when they did valiant service for the Queen, affording conspicuous assistance in the late Zooloo war. With frightful rashness, a disarmament act was carried through the Legislature, and the command went forth that the Basutos should deliver up their guns. The French Protestant missionaries who lived among them protested against the injustice of the demand. Sir Garnet Wolseley warned the home Government of its impolicy and danger. The Basutos regarded these weapons as a badge of manhood and dignity. When diamonds were discovered in West Griqualand, the Basutos were the first and principal laborers; and each took home as his richest reward a gun which he had purchased at an exorbitant price. The command to give up the weapons which they had been encouraged to acquire, was regarded by every one as an unmerited disgrace. Letsie, the principal chief, and his people, who remained loyal throughout

* For the first six months of the year only.

the war, remonstrated in the following pathetic terms: "Hitherto we have been known first as the faithful friends and allies of the Queen, and then as her faithful subjects. Up to the Zambesi and down to Cape Town we are known as such—we are named the children of the Queen. If we are disarmed, will not other tribes say that we have offended against the Government?"

The political position of the Basutos was anomalous. When they swore allegiance to the crown in 1869, it was with the stipulation that they should not form part of Cape Colony, and they were not, until 1879, when the act conferring autonomy upon the colony heedlessly turned them over to the tender mercies of the Cape Government. The Basutos were a branch of the Bechuana tribe, one of the most superior and intelligent races of the Bantu family. After the formation of the tribe in Basutoland they became involved in constant disputes with the Orange Free State Boers on one side and the Zoolos on the other, and, when these growing states menaced them with extinction, they appealed to the British authorities for protection, and were accepted as British subjects. Their subsequent history is one of peaceful prosperity and advancement unexampled among African races. They grew rich in cattle, horses, and grain; built houses, schools, and churches; and were tenderly loyal until the offensive orders to deliver up their lawfully acquired weapons. Letsie and his tribe complied, but their arms were intercepted and seized before their delivery by the indignant majority. The invasion of Basutoland by the Cape militia and the earlier stages of the war of resistance are recounted in the "Annual Cyclopædia" for 1880.

The Basutos made skirmishing assaults in the beginning of January upon the towns of Maseru and Leribe and the picket-line of Colonel Carrington's advancing column. In a vigorous attack on the 10th the Burgher Guards gave way, and the field was held only by a line of dismounted cavalry. The burghers were suspected of being actuated by sympathy for the Transvaal rebels, and a large number of them were sentenced to imprisonment. The Basutos were becoming weary of fighting and suffered for want of food. They sued for peace, and an armistice of seven days was granted on the 18th for them to consider the Governor's answer. They did not accept the proposals through distrust, and desired to settle the terms with the imperial authorities. Active hostilities were not resumed again, with the exception of a few fitful attacks. The imperial authorities refused to intervene unless the Colonial Government should resign the control of Basutoland entirely. This a considerable party in the colony desired to do. Sir Hercules Robinson finally, at the request of the Basuto chiefs and by desire of the Cape ministry, arranged the conditions for the cessation of the ineffectual struggle. The Basutos were

to pay a fine of 5,000 cattle to the Cape Government, to restore property taken from loyal natives, and to pay £1 annual license fee for the privilege of keeping a gun, and should enjoy entire amnesty and suffer no confiscation of territory. It was found impossible to thoroughly enforce the provisions of the agreement.

The outbreak of the Transvaal rebellion is noticed in the "Annual Cyclopædia" for 1880. The Boers had reasons to dread the aggressions of the British. Their ancestors were driven by wrongs and indignities to abandon their homes in the old colony and go into the unexplored wilderness. The Republic of Natalia which they founded no sooner began to prosper than it was invaded and conquered by British troops. The Boers again abandoned their fertile fields for the bleak desert. They founded the independent South African republics. In 1848 the land between the Vaal and Orange Rivers was annexed by Great Britain, and then the land between the upper Caledon and the Vaal. This act drove them to rebel, and the British chased them into the unknown wilderness beyond the Vaal. In 1852 a convention was signed, guaranteeing to the Boers north of the Vaal River "the right to manage their own affairs, and to govern themselves according to their own laws." When the Transvaal was annexed after twenty-five years of tranquillity, the population had increased to between thirty and forty thousand whites, and the revenue to about £70,000. The annexation met the clamorous approval of a class of British traders and land speculators who had flocked into the Transvaal after the gold discoveries, adventurers who sought pecuniary profit in the disturbance of rights which would ensue. The prospect that President Burgers's projected railroad to Delagoa Bay would deprive Durban of the Transvaal trade was a strong secret motive with English colonists for demanding the annexation. A financial and political crisis of the Transvaal Government furnished the occasion for the usurpation. The fear that financial aid would be furnished for Burgers's project of establishing a Transvaal port, which might be followed by a German protectorate, was one of the state reasons for the step. The Boers themselves were undoubtedly almost unanimously opposed. The formal protest of President Burgers at the time, the two visits of the delegates, Joubert and Kruger, to England, and the mass-meetings of remonstrance, should have left no doubt of the rooted aversion of the Boers to British dominion.

The arrogance and unfitness of the administrator set over the Transvaal, Sir Owen Lanyon, and the other British officials, was one of the proximate causes of the outbreak. During the agitation which lasted throughout the three years of British administration, and during and at the close of their desperate rebellion, the Boer leaders and representative men iterated and reiterated the conditions under which a

connection with the British Empire would be endurable to the Boer people, conditions which it required the deplorable war to make clear to the British Parliament and people, and which were at last freely accorded before a British force had set foot across the Transvaal boundary, though defeat following defeat had brought the blush of shame into many Englishmen's faces and stirred thoughts of revenge in their hearts, and although enough British troops had just landed in Natal to speedily exterminate the valiant descendants of Huguenot refugees and stalwart Dutch pioneers.

One of the strongest reasons for the annexation had been the frequent difficulties of the Boers with the native tribes. The principal danger had been averted by the extinction of the Zooloo power, accompanied by the reversal of the British commissioners' decision on the chief matter in dispute, their award to Cetewayo of the land which he had formally ceded to the Transvaal, and which had already been settled by Transvaal farmers. The cession of Keate's award, in which diamonds had been discovered, to natives by a British arbitrator, probably preparatory to engrossing it in the British dominion, as had been done with West Griqualand, was another instance of the obliquity of British arbitrations. Nevertheless the Boers were content from the beginning to refer boundary questions and disputes with the aborigines to English adjudication, and much more so after the punishment of their old enemies the Zooloos. If it had not been for the wars with Cetewayo and Secocoeni, the Boers would have struck earlier for independence.

In the middle of December, 1880, the republican flag was raised in Heidelberg, a Volksraad was convened, and the South African Republic proclaimed. The Boer Government was originally composed of Kruger as President; Joubert, Commandant-General; Jorissen, Attorney-General; and Bok, acting State Secretary. Pretorius was afterward associated with Kruger and Joubert in the supreme direction. A proclamation of the Boer Government set forth their desire to form a confederacy with the other colonies and states; their willingness to receive a British resident diplomatic agent to represent the interests of British subjects; and also to submit to arbitration their disputes over boundaries with native tribes. Besides the quarrel concerning a small tract in the southeast, which had led to the Zooloo war, there was the standing difficulty about the large and fertile region in the southwest corner of the Transvaal, called the Keate award, which the British referee had awarded unconditionally to native claimants, and the vast region of the northeast from which the Boer settlers had been expelled by native tribes who had been for a long time in possession of the entire country. The titles to lands in this reconquered territory had been bought up by speculators.

The first engagement of the war was the

surprise and surrender of a detachment under Lieutenant-Colonel Anstruther, at Bronker's Spruit, while marching from Middleburg to Pretoria, December 20, 1880. The rebellion of the Boers, with the triumvirate, Paul Kruger, Pretorius, and Joubert, at the head, was in full operation at the beginning of January, 1881. British garrisons were beleaguered in Pretoria and Potchefstroom. The Boers secured Natal as far as Newanka, and took possession of the Barkly district of Griqualand West. Sir George Colley was mustering his forces at Newcastle, with about fifteen hundred within call; while re-enforcements from India and Gibraltar were on the sea. General Colley advanced his column slowly toward Pretoria. The means of transport were nearly all in the possession of the Boers and their sympathizers. On the 28th of January he attempted to force the pass of the Drakensberg at Laing's Neck, which the Boers were massed to defend. The republicans displayed steadiness and courage of the highest order, and repulsed the rash British commander with severe losses. The Fifty-eighth Regiment, which stormed the strong intrenched position of the Boers, was driven back with terrible slaughter. Many of the officers were picked off by sharpshooters. Sir George Colley was now himself hemmed in on all sides. In an attempt to restore communications with Newcastle he was attacked by the Boers near the crossing of the Ingogo, February 8th, and lost one hundred and fifty men and six officers.

Re-enforcements landed at Durban at this juncture, when every British force in Africa was surrounded by the Boers, of whom 10,000 to 12,000 were under arms. They withdrew beyond the Drakensberg and perfected the fortifications at Laing's Neck as Sir Evelyn Wood brought up re-enforcements to Newcastle. Proposals for a treaty had already come from Kruger, and had been forwarded to England, when General Colley proceeded to occupy with about 700 men the height of the Spitzkop on Majuba Mountain, which commanded the Boers' position. On the following day, February 27th, the Boers carried the eminence by storm, with the most heroic exertions. The British commander, Sir George Pomeroy Colley, who was also the High Commissioner for Southeast Africa, was slain with 82 others, and 184 were disabled or captured. The repeated successes which the Dutch farmers gained over the British regulars were won in nearly every instance with astonishingly small numbers, although the *morale* of the British troops was not particularly defective. They were due to their desperate and religious devotion to the cause in which they were engaged, not less than to their splendid marksmanship with the rifle, and their alert and intelligent tactics. Sir Frederick Roberts was now appointed commander-in-chief, and about 15,000 troops were sent to the field of action from all parts of the empire. Before his arrival Sir Evelyn Wood, acting under instruc-

tions from home, and Commandant-General Joubert, had arranged an armistice, procured through the intermediation of President Brand, of the Orange River Republic, to allow time for Kruger and the Boer authorities to consider terms of peace which the Imperial Government offered. Under the terms of the armistice the English were permitted to provision their beleaguered garrisons in Potchefstroom, Pretoria, Wakkerstroom, and Standerton with a week's rations. Before the supply-train reached Potchefstroom, the garrison surrendered, March 21st, giving up their guns and departing on parole for Natal. The withholding from the besieged force knowledge of the approach of succor was adjudged a violation of the armistice, and it was agreed to allow the fort to be reoccupied, to restore the *status quo ante*.

The strongest sympathy with the Boers and indignation at the course of Great Britain prevailed among the entire Dutch population of South Africa. It was this state of feeling which was advanced as the reason for taking vengeance upon the insurgents. The apprehensions caused by the known tension among the old families were augmented by a manifesto of Kruger, which said that, whether the Boers were now successful or not, the struggle would lead to the redemption of the colonies from the British yoke, and independence, like that achieved by the American colonies, when "Africa will be for the Afrikaner from the Zambesi to Martin's Bay." The people of Holland and Belgium manifested publicly their sense of England's injustice, and a large section of the British public expressed the same sentiment. Public men in Germany, in France, and in other Continental countries set their names to memorials pleading for the bestowal of independence upon the Transvaal.

The negotiations with the Boers were concluded by their acceptance of the terms of peace, March 21st, subject to their final agreement in the decisions of a royal commission settling the details of boundaries and questions of the rights of natives. The commission was to consist of Sir Hercules Robinson, Governor of Cape Colony and High Commissioner for South Africa, President, and Sir Henry De Villiers, Chief-Justice of the Cape, and Sir Evelyn Wood, associate members. The Boers agreed to withdraw from Laing's Neck and disperse to their homes. The English garrisons should remain as they were pending the final settlement, but no troops or munitions of war were to be sent into the Transvaal. The main principles of the treaty were that the Boers should enjoy complete independence in making and administering their own laws; but the right to regulate and superintend their relations with the native population, which numbers nearly 700,000, the adjustment of frontier questions with the resident and neighboring tribes, and the control of foreign relations, were reserved by the Imperial Government,

represented by the High Commissioner in Cape Town, and in the Transvaal by a resident imperial agent. This peculiar form of a protectorate was defined under the new term of the *suzerainty* of the Queen. The determination of the rights and claims of the natives and of provisions for the protection of native interests was the task imposed upon the commissioners, who immediately commenced their labors. They were also empowered by the terms of the settlement to decide the question of the severance from the Transvaal of portions of the territory in the east and northeast settled by natives, and thus separate the Zooloo and Swazi districts from the Transvaal. The last proposition was loudly condemned by the Boer people. After the conclusion of this preliminary settlement, the Boers departed for their farms. The British commander, General Wood, did not decrease his armaments, but prepared vigorously for the case of a renewal of the war.

After many difficulties and compromises a convention was settled between the Boer authorities and the commissioners on the 8th of August. The Transvaal Government undertook the debt of £425,893, payable in twenty-seven years, at 4½ per cent interest, on account of the liabilities which the British Government had assumed at the annexation, and the expenses of Secocoeni's war. The Boers and the British each agreed to reimburse sufferers of damages through the military operations. The convention was ratified by the Volksraad in October.

The Cape Parliament met March 25th. The Premier of Cape Colony, Gordon Sprigg, the author of the Basuto war, was nearly removed from office in April by a vote of censure, for raising, on his own responsibility, a loan of £1,250,000, for the prosecution of that unfortunate military essay, and for the other war expenditures of the colony. The war itself was not condemned by either the West or the East colonists, the Afrikaner or the English section of the community. Mr. Sprigg represented more especially the English element, as opposed to the Dutch, and the aggressive spirit of the former Imperial Government. He had been called upon by Sir Bartle Frere three years before to succeed Molteno, who had been arbitrarily dismissed while still backed by a parliamentary majority. Upon a subsequent renewal of Mr. Scanlan's motion, Mr. Sprigg resigned. A new ministry was formed, composed of Mr. Molteno, the Prime Minister whom Sir Bartle Frere had removed, Colonial Secretary; Mr. Hutton, Treasurer-General; Mr. Scanlan, Attorney-General and Premier; Mr. Merriman, Commissioner of Crown Lands and Public Works; Mr. Sauer, Secretary for Native Affairs; Mr. Hoffmeyer, without a portfolio.

In the budget of the Cape Treasurer the revenue of the colony for 1881 is estimated at £2,968,210, and the expenditure at £2,852,083.

The revenue for the year concluded was £2,800,000, and the expenditure £2,633,783.

The Assembly resolved that an amendment to the Constitution be adopted, to allow the option of addressing Parliament in the Dutch language. The further extension of railroads was decided upon, including a line to West Griqualand. Harbor improvements were also authorized. The railroad construction authorized involves expenditures amounting to five millions sterling.

CARLYLE, THOMAS, an eloquent British author and leader of contemporary thought, died at his house in Chelsea, February 5th. He was the eldest of a family of eight children. His father, James Carlyle, the son of a small Scotch tenant farmer, was a working stonemason at the time of the author's birth, and afterward became a prosperous farmer; he was a man of rectitude and energy, possessing mental traits and endowments similar to those which, developed in literary form, gave his son the mighty influence he has exercised over the English mind. All his sons became men of character and ability. Thomas Carlyle was born at Ecclefechan, a village near Dumfries, December 4, 1795. He learned to read and write in the parish school of Hoddam, and was taught the elements of Latin by the minister. In his ninth year he passed into the burgh school at Annan. Before his fourteenth birthday he entered the University of Edinburgh. He made few friends, and was little interested in the professors and their teachings, although they numbered among them men of European reputation, who were able to inspire an unusual zest in the generality of students for the literary and philosophical studies of the classroom. Carlyle devoted himself to reading, exploring with avidity the college library and the various circulating libraries of the city. These independent and desultory studies were so confining as to impair his health. Under Sir John Leslie, whom alone among the professors he made his friend, he obtained a knowledge of mathematics rare among youths of his years. He was destined for the ministry by his father, but after passing through the four years' curriculum of arts he concluded that he could not conscientiously follow that profession. "Now that I had gained man's estate," he said, recounting the spiritual crisis he passed through in deciding the question, "I was not sure that I believed the doctrines of my father's kirk; and it was needful I should now settle it. And so I entered my chamber and closed the door, and around me there came a trooping throng of phantasms dire from the abyssal depths of nethermost perdition; doubt, fear, unbelief, mockery, and scoffing were there; and I wrestled with them in agony of spirit." He embraced the calling of a teacher, and first taught mathematics in the school he had lately attended in Annan; and after remaining there two years went to Kirkcaldy to teach mathematics and the classics in the burgh

school, wishing to be near his friend Edward Irving, who had a private school in the same town. After two more years spent in this uncongenial pursuit, in which he acquired the name of a stern pedagogue, Carlyle went up to Edinburgh to embark in the profession of literature. His first employment was in the compilation of Brewster's "Edinburgh Encyclopædia." At the instance of Sir David Brewster he translated Legendre's "Geometry and Trigonometry," prefacing it with an essay on proportion. At this time he made the acquaintance of the German language and its literature, the treasures of which were first unlocked to the English-reading public by his sympathetic translations and criticisms. His brother, Dr. John Carlyle, who afterward acquired a place in literature by his translation of Dante, was at that time studying in Germany. Carlyle contributed to the "New Edinburgh Review" an article on "Faust," the first product of his German studies. He was for several years tutor to the gifted Charles Buller. He joined the staff of brilliant writers engaged upon the "London Magazine," to which he contributed in 1823 the first part of his "Life of Schiller," and in the following year a translation of "Wilhelm Meister's Lehrjahre." Goethe's novel and the style of the translation were sharply assailed by the critics, led by De Quincey, one of the few Englishmen who at that time knew anything about the master-poet of Germany. Undeterred by the contempt with which that masterpiece of German literature had been received, Carlyle in 1827 published several volumes of "German Romance," containing translations of short pieces of fiction by the principal writers of the romantic school.

In 1827 Carlyle married Jane Welsh, daughter of Dr. Welsh, of Haddington, who was a descendant of John Knox. Carlyle's wife owned a farm among the Dumfriesshire hills, whither he betook himself and lived for six years, wrapped in his literary work, with his wife for his only companion. Mrs. Carlyle was in character and intellect hardly inferior to her husband. In the seclusion of Craigenputtock farm Carlyle wrote the essays on Burns, Goethe, and Johnson, Heyne, Novalis, Voltaire, and Diderot. "Sartor Resartus" was written at this period, but not published till years afterward. The young author, by the independent and self-prompted work which he was enabled to accomplish in his mountain retreat, gained a great name, and was occasionally sought out by visitors from afar who had drawn light from his philosophy and hailed him as their teacher. Emerson visited him at Craigenputtock, and listened with wonder to the brilliant and original talk which streamed from the lips of his host. Carlyle wrote for the "Edinburgh Review," but was frequently offended at the ruthless liberties that Jeffrey took with his manuscript, which was pruned and patched by that pedantic editor into conformity with his finical canons of taste. With Napier as editor, Carlyle's

relations with the review were pleasanter. Jeffrey in a letter to his successor warns him that Carlyle would not be a proper contributor—"that is," he explained, "if you do not take the liberties and pains with him that I did, by striking out freely, and writing in occasionally. The misfortune is that he is very obstinate and, I am afraid, very conceited." Carlyle composed "*Sartor Resartus*" in 1831. This remarkable work of philosophical satire and profound reflection went begging for a publisher, and first appeared in a magazine, seven years after it was written. In order to be near libraries and obtain the advantages of social intercourse necessary to an author of his rank, he left his rustic home for London in 1834, settling in the house in Cheyne Row which he inhabited till the day of his death. The productivity of his genius in the first few years of his metropolitan residence was extraordinary. He labored incessantly and with intense application. He worked with the pen from ten to three every day, and, after an intermission for exercise, visiting, and letter-writing, studied all the evening. He had to wait long for recognition in London. The reviewers ridiculed the eccentricities, the roughness, the strange choice and collocations of words, the incomprehensible Germanisms, and all the peculiarities of his style. The publishers were not eager to print his productions. Even the "*French Revolution*," the most brilliant and impressive, and the most characteristic product of his genius, did not immediately find a publisher. The occasion of the removal of Thomas Carlyle and his wife to Chelsea was the publication of "*Sartor Resartus*." Only in America did this work meet with unhesitating admiration. Thomas and Mrs. Carlyle found cordial and appreciative friends among the literary profession, and a knot of eminent writers delighted to gather in their small house in the suburb. Between 1837 and 1840 Carlyle read some courses of lectures in London on "*General Literature*," "*The History of Literature*," "*The Revolutions of Modern Europe*," and "*Heroes and Hero-Worship*," which wrought a profound impression in intellectual society. "*The French Revolution*," the first work which bore Carlyle's name on the title-page, was published in 1837. The first volume he had been obliged to rewrite. He had lent the manuscript to John Stuart Mill, who had confided it to Mrs. Taylor, whose servant, it is supposed, took it to kindle the fire.

In 1839 Carlyle commenced to turn his attention to the wants and hardships of the lower classes. Between that year and 1850 he published "*Chartism*," "*Past and Present*," and "*Latter-Day Pamphlets*," diatribes filled with bitter scorn, directed indiscriminately against the indifferentism of the political economists, and against the doctrine that remedial legislation or the extension of popular rights can be of use in the work of social reformation. In 1845 was issued "*Oliver Cromwell's Let-*

ters and Speeches," a successful book. The Great Protector was only known to the English people before the publication of Carlyle's memoir in the image of the mingled hypocrite and fanatic, lunatic, scoundrel, and buffoon, pictured by his detractors. In 1851 Carlyle published a biography of his friend John Sterling. Between 1858 and 1865 came out Carlyle's "*Frederick the Great*," the product of long labor and critical research. In its preparation he resided some time in Germany, and visited the scenes of Frederick's battles. This was Carlyle's last great work. During the American civil war he gave out, in "*Ilias in Nuce*," his morose reflections on the destiny of the republic and the value of the institution of slavery. In 1865 Carlyle was elected rector of Edinburgh University. In the following year, while he was absent, delivering to the students a lecture on the choice of books, his wife died. The loss of his companion was to him a source of poignant grief; he wrote that "the light of his life had quite gone out." In 1867 the discussion of the extension of the suffrage brought out "*Shooting Niagara, and After*," a dismal vaticination of the terrible consequences of democratic freedom. In 1870 he published, in the London "*Times*," reflections on the Franco-German War, expressing approbation of the prospective annexation to Germany of Alsace and Lorraine.

Carlyle exerted as far-reaching an influence upon the men of his time through his conversation as through his published writings. In speaking, he was less apt to fall into the grotesque involutions of phrase and idiosyncrasies of language which mar his writings. These faults of style grew upon him, and render his later works difficult and disagreeable to read. His letters were free from these vices. In early life, he wrote rapidly, and spent little pains on revision; but in later years he corrected, rewrote, erased, and interpolated with excessive care.

Carlyle was ailing several years before his death. He left some autobiographical materials, which were committed to James Anthony Froude, as his literary executor, and were published by him without excision. The pungent and sometimes unkind reflections on friends and associates of Carlyle caused much indignation against the editor and no little sorrow among the friends of the dead philosopher.

Thomas Carlyle propounded a social philosophy, which did not fall in with the spirit of the age, but which acted as a corrective to the current doctrines. As a critic, he disclosed real flaws in the habit of thinking that has grown up, which regards the collective opinion of the commonalty, which is only derivative, and must often be outstripped by the authors and actors of history, as the prime impulse in social progress. He exalted the value of the individual will, and delighted in the exhibitions of energy and power by the rulers of modern times, with too little discrimination of their

motives or of the effects of their acts on civilization.

CARPENTER, MATTHEW H., born in Moretown, Vermont, in 1824; died in Washington, February 24, 1881. In 1843 he entered the Military Academy at West Point, where he remained two years. He then went to Boston and studied law with Rufus Choate, and was admitted to the bar. In 1848 he removed to Wisconsin, and entered the practice of his profession, in which he soon became eminent for his legal ability and brilliant talent, which won him high reputation in the Supreme Court of the United States even before his entrance into public life. Not until after the war did Mr. Carpenter take an active part in politics. Before and during the war he was a Democrat; but, when the leading men took sides on that issue, he became a Union man. When, at the close of the contest, he espoused Republicanism, his generally recognized ability commanded for him the active support of that party in Wisconsin, and in 1869 he was elected to the United States Senate in place of Senator Doolittle.

Mr. Carpenter served in the Senate from May 4, 1869, until March 3, 1875, and occasionally showed great power as a lawyer and debater, but lacked those qualities necessary to make a public man understand public sentiment. He belonged to that class of brilliant politicians who so strongly influenced the proceedings of Congress from 1869 to 1875, and of which General Butler was a representative man. About this time Mr. Carpenter was the victim of malicious slanders, but he was able to prove to general satisfaction that they were groundless. In 1874 Wisconsin Republicans, like the party elsewhere, were suffering from the injudicious action of Congress upon the salary bill and like matters, and the feeling against the railroad corporations was also a distracting element. The party had, however, a majority in the Legislature, but a considerable portion of it was made up of Independents. Mr. Carpenter received the caucus nomination for Senator, but the independent minority refused to vote for him. After a protracted struggle, the Democrats joined the independent Republicans and elected Mr. Cameron. Mr. Carpenter accepted his defeat, vouched for the Republicanism of his successor, and retired to his extensive law practice, taking little interest in political affairs. During the contest over the presidential succession of 1876-77, Mr. Carpenter appeared before the Electoral Commission as one of the Tilden counsel, and made an argument in his behalf. The Legislature of Wisconsin, which met in January, 1879, was called upon to choose a successor to Senator Howe. The contest between Messrs. Howe, Keyes, and others, was a bitter one, and finally Mr. Carpenter was presented as a compromise candidate. He had been approved on financial questions, and his superior talents rose paramount over all the opposition formerly urged.

His election gave general satisfaction to the Republicans. He took his seat March 4, 1879. Among several speeches which he addressed to the Senate, all remarkable for their ability, that against the Fitz John Porter bill is regarded as his finest effort. His course in politics during his last term in office was much more independent than previously, and as a lawyer he had few equals in Washington, where most of his later years were spent.

CENSUS OF THE UNITED STATES.
(See UNITED STATES CENSUS.)

CHEMISTRY. The president of the Chemical Section of the British Association, Professor A.W. Williamson, made the growth of the atomic theory during the last fifty years the subject of his opening address at the last year's meeting, maintaining that its general validity had been confirmed by the tests of experimental application to which it had been rigorously subjected. The binary or dualistic theory of combination, and the doctrine of multiple proportions which were formerly connected with it, and which seemed to be satisfactorily applicable to the simpler compounds and the salts, broke down when chemists came to deal with double compounds which were not saline in character, and with the carbon compounds; and it became necessary to find other methods of accounting for the phenomena of chemical combinations. As the investigations were continued with reference to this object, the idea of substitution came to be more and more used in the place of that of mere additive combination. Elementary chemical reactions which, according to the binary theory, were supposed to consist of dualistic processes, involving sometimes the assumption of forces (like predisposing affinity) of a purely metaphysical character, were explained as consisting of atomic displacements, or interchanges of a kind well known to be of common occurrence. Many products of the combination of known molecules have been found to be formed by processes of double decomposition, so that each molecule of such products is built up partly of atoms derived from one of the materials, partly of atoms from the other. In the organic compounds, many of the molecules having a very complex structure have been found to undergo in their reactions very simple changes, of the same kind as those which mineral compounds undergo. Families of organic compounds have been discovered whose members are connected by close analogy of constitution and properties, each of them forming a series, each term of which is a compound whose molecule contains one atom of carbon and two atoms of hydrogen more than the previous one. Our knowledge of molecules has undergone a most remarkable and important extension by the discovery that various elements in what we are accustomed to consider the free state, really consist of molecules containing like atoms combined with one another. Those marvelous varieties of matter called isomeric compounds have found

their natural explanation in differences of the respective arrangement of like atoms. The term "equivalent" was introduced to indicate the proportional weights of analogous substances which were found to be of equal value in their chemical effects. Tables of the equivalent weights of acids were made, representing the proportions of the several substances that were found to be of equal value in neutralizing a fixed quantity of a certain base; and similar tables were made for the bases, as well as for the elements themselves. But little attention was paid under the dualistic system to the essential difference between atomic weights and equivalent weights; but under the later developments of the theory of the functions of atoms, it has become necessary to study the relation of equivalence between elementary atoms, instead of studying them from the point of view of elements divisible in any proportion. From this has sprung the division of the elements into classes consisting respectively of equivalent atoms known as monads, dyads, triads, tetrads, etc., the character of which is well represented in the four typical compounds, Cl H , O H_2 , N H_3 , C H_4 , where chlorine appears as a monad, oxygen as a dyad, nitrogen as a triad, and carbon as a tetrad. This has probably been one of the most important steps yet made in the development of the atomic theory, and has been seen to correspond in so clear and striking a manner with a vast number of well-known properties and reactions of compounds as to deserve and acquire the confident trust of chemists. Another great step has recently been made which may be destined to lead to most important results. It has been discovered that if we arrange the elements in the empirical order of their respective atomic weights, beginning with hydrogen, and proceeding thence step by step up to the heaviest atom, we shall have before us a natural series with periodically recurrent changes in the chemical and physical functions of its members. Of course the series is still imperfect, and exhibits gaps and irregularities; but some of the gaps have been filled up by the discovery of elements possessing the anticipated properties, inducing the hope that the others may be filled. The generalization affords a brilliant addition to the previous corroborations of the reality of the units of matter which chemists have discovered. But little account has as yet been taken of atomic motions; but it has been proved that the heat of combination affords a measure of its force, and we know that, in giving off heat, particles of matter undergo a diminution of the velocity of their motion. The force of chemical combination is evidently a function of atomic motion, but a vast amount of work will be required to develop the atomic theory to the point of explaining the force of chemical action in precise terms of such motion.

ATOMIC AND MOLECULAR WEIGHTS.—*Variations in Atomic Value*.—Professor A. W. Will-

iamson regards the opinion that atomic values are invariable, or are variable only within particularly defined limits, as an error. He remarked in a recent address that he had been frequently struck by the fact that two theories, believed at one time to be conflicting, had been shown by the progress of study to be both true. Such was the case with the rival theories, one of which represented molecules as constructed after the pattern of three or four types, while the other viewed them as containing complex groups called radicles. Opposition existed at one time between those who made use of atomic weights and those who employed equivalent weights; and the most important step that has of late been taken is the introduction of the notion of equivalence into the atomic theory. An inspection of the series of hydrogen compounds with chlorine, oxygen, nitrogen, and carbon, will show that the atom of chlorine, which combines with a single atom of hydrogen, has a different value from the atoms of oxygen, nitrogen, and carbon, which combine respectively with two, three, and four atoms of hydrogen. Hence, nitrogen and other elements of like equivalence are called trivalent or triads, while other elements are classed, according to the exponents of their equivalence in groups, as monads, dyads, pentads, etc. Kekulé still holds that an element can belong to only one of these groups; that nitrogen, for instance, is trivalent only, and that in sal-ammoniac, where it is combined with five other atoms, instead of being pentavalent, it is a molecular compound of two chemical compounds—ammonia and hydric chloride; and that the atoms of constituent molecules and the molecules themselves were held together by different forces, one being molecular, the other chemical. We have, however, no grounds for assuming a difference between chemical and physical forces, and Kekulé's theory is no longer tenable. The theory commonly in vogue is that atoms vary in value within certain narrow limits; that nitrogen, for instance, is either trivalent or pentavalent. Professor Williamson recognizes no limitation to atomic value; but he knows that many elements have atomic values greater than those commonly assumed. The character of the atoms often materially affects the result. Thus gold can not combine with more than three atoms of chlorine alone, but it can take up an additional atom of chlorine if supplied with an atom of sodium. In this way we get the common double chloride of gold and sodium, NaAuCl_4 , in which the gold is pentavalent. We are not to consider the sodium as being here combined with the gold as such, but as combined with the whole group. Temperature, also, has an influence upon the atomic value of elements, a rise of temperature tending to diminish it.

Molecular Weight of Hydrofluoric Acid.—Professor J. W. Mallet has made some studies of the atomic weight of hydrofluoric acid, with a view to finding an explanation of some

peculiar differences in the behavior of fluorine in entering into combination with other elements. The analogies of fluorine with the halogens on the one hand, and with oxygen on the other hand, have often been remarked upon. The compounds of fluorine generally bear resemblance to compounds of chlorine, but some striking differences in the character of these compounds have also forced themselves upon the attention; and the tendency of the fluorides to the formation of double salts, with formulas analogous to those of oxygen compounds, and the formation of salts including both oxygen and fluorine, has suggested that some close natural relation may exist between these elements themselves. There has, therefore, been ground for questioning whether fluorine should be classed with chlorine among the monad elements, with the formula HF to represent hydrofluoric acid, and assigned an atomic weight of 19, or with oxygen among the dyads, with the formula H_2F for hydrofluoric acid, and an atomic weight of 38. Professor Mallet's experiments bore a special reference to this question. The result was such as to justify the assumption that at the temperature of 30° centigrade the molecule of hydrofluoric acid vapor should be represented, not as HF , but as H_2F_2 , while at higher temperatures dissociation takes place, leading to the production of diatomic molecules of HF . The structure of the molecule of double weight, H_2F_2 , may be regarded as resulting from fluorine behaving not only as a monad, but also as a triad, and acting in double atoms like those of nitrogen in the di-azotic compounds. In such a condition the element presents a pseudo-dyad character, and becomes capable of replacing oxygen and of manifesting the linking function of that element. This assumption, supported by the experimental evidence brought forward by Professor Mallet, may serve conveniently to explain the composition of a number of fluorine compounds, whose formulas are difficult to write in a satisfactory way if fluorine be considered exclusively monad.

Atomic Weight of Platinum.—The group of metals embracing osmium, iridium, and platinum has until recently exhibited a series of irregularities in that their atomic weights did not manifest those relations to each other which their properties, in connection with Meyer and Mendelejeff's theory of classification, indicated they should bear. Dr. K. Seubert, two years ago, undertook the revision of the atomic weight of iridium, and fixed it at 192.644, putting it below that of platinum. He has since fixed the atomic weight of platinum at 194.177, giving it the place above that of iridium and below that of gold, which the theory requires it should occupy, while the previous estimation of its atomic weight made it above that of gold. The ascending series, iridium, platinum, gold, is now, as to those three metals, agreeable to theory; but osmium still occupies an anomalous position, its re-

ceived atomic weight, 198.5, being above that of gold, while the theory requires that it should be below that of iridium.

Molecular Weights of Decipium and Samarium.—M. Delafontaine, in 1878, described an earth having a molecular weight of about 122, which he had obtained from samarskite, and which he called decipia, regarding it as an oxide of a new metal, decipium. He has continued his studies of this substance, and has been brought to regard it as a mixture of two oxides, one of them having a molecular weight of about 130, and the other a lower molecular weight. The former substance gives no absorption spectrum, while the second gives the spectrum which M. Delafontaine described in 1878 as that of decipia. M. Lecoq has also announced the discovery of a new metal in samarskite, corresponding with the second substance detected by M. Delafontaine, to which the latter proposes to give the name of samarium. The molecular weight of its oxide is believed to be less than 117. Samaria appears to be identical with the earth $\text{Y}\beta$, having a molecular weight of 115, which M. Marignac has found in samarskite, while that chemist's Ya , having a molecular weight of 120.5, may be supposed to be a mixture of decipia and terbia.

Atomic Weight of Aluminum.—Professor J. W. Mallet, considering that the estimation of the atomic weight of aluminum was resting on an insufficient basis of accurate experiment, has pursued, during three years, a course of experiments for the revision of the determination, in which he has kept in view the principles—1. That each process used should be as simple as possible, and should involve as little as possible of known liability to error; 2. That different and independent processes should be resorted to as the means of checking each other's results; 3. That each process should be carried out with quantities of material differing considerably from each other in successive experiments; 4. That only such other atomic weights should be involved as may be counted, among those already known, with the nearest approach to accuracy. Three series of experiments were conducted, of which the first series was based on the purification of ammonium alum; the second on the preparation and purification of aluminum bromide; and the third on the preparation and application of pure metallic aluminum. The mean result of the twenty-five experiments which were regarded as the more accurate of the thirty that were made, gives the atomic weight of aluminum as 27.02. This is believed by Professor Mallet to bear in favor of Prout's law, which assumes that all the atomic weights are multiples of that of hydrogen.

Atomic Weight of Cadmium.—Mr. Oliver W. Huntington, under the direction of Professor J. P. Cooke, of Harvard College, has made a revisionary determination of the atomic weight of cadmium. He used a pure bromide of cadmium, specially prepared for the pur-

pose, and the bromide of silver, likewise specially prepared, for comparison. The mean of a series of eight experiments gave 112.31 as the atomic weight of the metal. This determination is regarded as bearing against the validity of the hypothesis of Prout, that all atomic weights are multiples of that of hydrogen.

New Processes.—Mr. Alfred H. Allen has indicated some valuable simple tests for the presence of hydrocarbon oils as adulterations in animal and vegetable oils. The methods for the detection of these oils are based on the density of the sample, the lower flashing and boiling points, the fluorescent character of the oils produced from petroleum, bituminous shale, and rosin, and the incomplete saponification of the oil by alkalis. The taste of the oil and its odor on being heated are also useful indications. If undoubtedly fluorescent, an oil certainly contains a mixture of some hydrocarbon, but the converse is not strictly true, as the fluorescence of some varieties of mineral oil can be destroyed by chemical treatment, and in other cases fluorescence is wanting. The greater number of hydrocarbon oils employed for lubricating purposes are, however, strongly fluorescent, and the remainder usually become so on treatment with an equal measure of strong sulphuric acid. If strongly marked, the fluorescence of a hydrocarbon oil may be observed in presence of a very large proportion of fixed oil, but, if any doubt exist, the hydrocarbon oil may be isolated. The fluorescence may be seen by holding a test-tube filled with the oil in a vertical position in front of a window, when a bluish "bloom" will be perceived on looking at the sides of the tube from above. A glass rod dipped in the oil and laid on a table in front of the window so that the oily end shall be projected in the view against the dark background of the floor, or a piece of black marble or smoked glass rubbed with a streak of oil and held horizontally before a window, will make a very slight fluorescence, readily perceptible. Turbid oil should be filtered, to get out the minute particles that might, by reflection, give an appearance of fluorescence. Dilution with ether, to which a little mineral oil imparts a strong blue fluorescence, gives an excellent test. The hydrocarbon oil may be driven off by heating it if its boiling-point is comparatively low, but may be better removed and the quantity of it measured by saponifying it, and washing the solution of the soap with ether. The hydrocarbon may, in this case, be recovered pure by separating the ethereal layer and evaporating it at or below a steam-heat. A good alkaline preparation for this purpose can be made by dissolving caustic potash in methylated spirit. The washing with ether should be repeated several times. The ether-process is, however, not applicable to spermaceti and the waxes, on account of the large quantities—so small in the other fats that it need not be taken into account—of matter they contain that is not acted upon by the alkalis

but is dissolved by ether. The nature of the hydrocarbon oil may be determined after it has been isolated, by observing its density, taste, smell, behavior with acids, and other qualities.

Professor G. Lunge, of Zürich, has perfected and described a simple and inexpensive process for procuring pure naphthalen that will not discolor. Presuming that the discoloration of naphthalen is analogous to that of phenol, he sought to remove the agent which caused it by oxidation. For this purpose he added an oxidizing agent in the ordinary chemical washing of naphthalen, using manganese dioxide, with complete success. Other oxidizing agents might be substituted for manganese dioxide, but a cheaper one can hardly be obtained. Naphthalen prepared by this process has kept its pure white color much longer than the "chemically pure" naphthalen made by the secret process of the manufacturers.

A patent has been taken out by M. Closson, of Paris, for a cheap and expeditious method of obtaining magnesia from magnesium chloride. The crude lye of magnesium chloride is treated with burned dolomite, or magnesian limestone, when the chlorine of the lye combines with the lime of the dolomite, so that if the latter is pure a magnesia of from 98 to 99½ per cent standard can be easily made on a large scale. The magnesia bricks prepared by this process at Leopoldshall resist even the flame of the oxyhydrogen-blast. The cost is fifteen shillings a ton. Sulphate of lime is obtained as a by-product of the process through the use of calcium chloride to remove the magnesium sulphate that is present in the magnesium chloride, and is used by paper-makers under the name of pearl-hardening. The value of the new process in its bearing on the manufacture of fire-proof furnace-linings, crucibles, etc., is very great.

Herr A. Wagner recommends the following process, which has proved very satisfactory for the limestone waters of Munich, for the determination of the organic matter in water. After the determination of all the other constituents of the water, he evaporates suitable quantities to dryness and separates the dry residue by means of distilled water into an insoluble and a soluble portion, the latter of which contains the chief bulk of the organic bodies. In the insoluble portion, which in the waters he has to deal with consists almost entirely of calcium and magnesium carbonates, he determines the organic matter by igniting a dried specimen in a platinum crucible and treating subsequently with ammonium carbonate in the customary manner. The portion soluble in water, if nitrates are absent or are present only in a quantity too small to be determined, is dried after evaporation in a platinum capsule, weighed, heated to a very low redness, and weighed again. If nitrates are present in larger quantities, so that the existing organic matter would not suffice to con-

vert the nitrates into carbonates, he adds to the soluble portion, after drying and weighing, a little pure solution of sugar, evaporates to dryness, and heats the platinum capsule gradually and by piecemeal with a very small gas-flame, so that no deflagration may happen. After prolonged but very gentle ignition, the sugar-charcoal is found burned away, when the residue is moistened with water containing carbonic acid, and weighed again after drying. The loss of weight in this case expresses the weight of the organic substances and the difference between the equivalent of the nitric acid which was present and of the carbonic acid which has taken its place. This difference can be easily calculated from the quantity of the nitrates as previously ascertained, and must be deducted. This process is not absolutely accurate, but Herr Wagner considers it more certain than others. Herr Wagner calls attention to the necessity, in experiments for determining the solid residues, of protecting the platinum or porcelain capsule in which the water is treated against the accumulation of a deposit from the gas-flame, through which a liability to error in weight is incurred. For this purpose he uses a thin sheet of platinum, instead of the ordinary wire gauze, between the capsule and the flame.

Mr. Thomas Moore has published the following new process for the separation of nickel and cobalt from iron: Having removed any excess of free acid by evaporation, and dissolving the residue in water, add to the solution a sufficient quantity of ammoniac sulphate to form a double sulphate with the nickel and cobalt present. Dilute to about 150 c. c., and add a rather large excess of oxalic acid, and stir well. In case a precipitate form, more ammoniac sulphate should be added until a clear solution is obtained. Add ammoniac hydroxide in considerable excess; stir, heat gently for a few minutes, and filter; wash well with water containing ammonia; or dilute to about 500 c. c., and, after allowing the precipitate to settle, withdraw a given portion of the clear upper stratum of liquid. This, after a further addition of ammoniac sulphate, to lessen the resistance to the electric current, is ready for electrolysis or any other method of estimating the nickel or cobalt.

Messrs. R. H. Chittenden and H. H. Donaldson, of the Sheffield Laboratory, Yale College, describe a process for the detection and determination of arsenic in organic bodies, which they recommend as very accurate, delicate, and simple. It is based upon Gauthier's process, and somewhat resembles it, but requires for reagents only nitric acid, sulphuric acid, and zinc. The organic matter is destroyed by successive oxidations with nitric and sulphuric acids, as in Gauthier's method, but at a much lower temperature. The suspected matter is then treated for fifteen minutes at 200° C., and allowed to cool, when a hard, carbonaceous residue, free from nitric acid, and containing

the arsenic as arsenious acid, is formed. This is extracted with water till it has been made to give up its arsenic, and the reddish-brown fluid containing some organic matter is evaporated to dryness. The residue is dissolved at a gentle heat with a definite quantity of dilute sulphuric acid, and introduced to a Marsh's apparatus for the decomposition of arseniuretted hydrogen by artificial heat, to which a Bunsen wash-bottle and a device for graduating the admission of the fluid have been added. The resultant gas having been dried in a chloride of calcium tube, is passed through a red-hot glass tube. Not a trace of arsenic passes by if the cooled tube is of proper length. The apparatus is then filled with hydrogen generated by the sulphuric acid-zinc process, and the glass tube, having been heated to redness, the arsenical solution in concentrated form is mixed with sulphuric acid, and the mixture is slowly passed into a separating funnel; then more and stronger acid is added, and the heat is kept up till the decomposition is wholly effected. The arsenic being collected in the form of a mirror of metal, the tube is cut, at a safe distance from the mirror, and weighed. The arsenic is removed by heating, and the tube is weighed again, when the difference gives the amount of metallic arsenic. The method is capable of detecting as little as the one thousandth of a milligramme of the metal. In organic matters the experimenters have detected a millionth of a gramme in urine and in an extract from beef. The experiments are claimed to show that the presence of organic matter in considerable quantity does not interfere with the recovery of the entire amount of arsenic.

VEGETABLE ANALYSIS.—Professor Henry B. Parsons, of Washington, D. C., has described a method for the more accurate analysis of plants. His apparatus includes a worm of block-tin pipe, suitably connected with a glass percolator, within which is suspended a smaller tube, having a bottom of filtering-paper and fine, washed linen. The weighed sample of the finely-powdered herb is placed within this tube for extraction. The solvent is introduced in a glass flask, tightly fitted to the outer percolator, and is volatilized by the application of heat through a water-bath. A tared filter, prepared by allowing fine asbestos, held in water, to settle on the perforated bottom of a platinum crucible, is also provided and connected with the receiving-vessel, while this in turn is connected with a Bunsen's pump. The air-dried specimen of the plant to be analyzed should be ground or beaten till all the particles will pass through a sieve having from forty to sixty meshes to the linear inch. A part of this should be further pulverized till it will pass through a sieve having from eighty to one hundred meshes to the linear inch. The finer part of the sample is employed in the immediate analysis, while the coarser part is reserved for the separation of those proximate principles

which may seem, from the analysis, to be worthy of more extended investigation. The amount of moisture is estimated by ascertaining the loss of weight on drying a small portion of the sample. The crude ash left after ignition is separable into the constituents that are soluble in water; those that are insoluble in water, but are soluble in dilute hydrochloric acid; and those which, insoluble in those substances, are soluble in sodic hydrate. The residue still undissolved consists usually of a little unconsumed carbon. The amount of nitrogen is determined by combustion with excess of soda-lime. Exposure of a part of the sample to the action of pure coal-tar benzole gives the benzole extract, which may consist of volatile oil removable by evaporation; alkaloids, glucosides, and organic acids, soluble in water; alkaloids, and possibly glucosides, soluble in dilute acids; chlorophyll and resins, soluble in 80 per cent alcohol; and wax, fats, and fixed oils which do not yield to either of the solvents. The part of the plant not dissolved by benzole is further treated with absolute alcohol, and afterward with other agents, as water, subacetate of lead, and dilute hydrochloric acid, as special tests. The part which remains insoluble, after treatment in alcohol, is exposed to the action of water; that part still remaining insoluble is boiled in concentrated sulphuric acid, for the conversion of starch, etc., into dextro-glucose. Boiling the residue from this treatment with sodic hydrate gives an extract containing albuminous matter, modifications of pectic acid, Fremy's "cucose," coloring, humus, and decomposition products. The crude fiber from this process, treated with chlorinated soda, bleached, and dried, leaves a residue of cellulose. Treatment with benzole, 80 per cent alcohol, and water, removes from nearly all plants the constituents of greatest chemical and medicinal interest. In analyses of food materials the compounds extracted by dilute acids and alkalies have great value.

A NEW DIGESTIVE AGENT.—In a paper before the French Academy of Sciences, M. Wurtz has drawn attention to the great chemical and therapeutical value of a substance called *papaine*, which possesses the property of exciting the digestive function. It is derived from the juice of the common papaw-tree (*Carica papaya*), which belongs to the family of the *Cucurbitaceae*, or gourds. The milky juice which contains the papaine is slightly bitter and styptic, free from tartness, but with a weak acid reaction, and is so highly charged with albumen that Vauquelin compared it to blood deprived of its coloring matter. It flows from incisions made in the bark and the green fruits, and is immediately bottled and sent to market, either pure or with the addition of ten or twelve per cent of alcohol to prevent fermentation. If pure, it becomes coagulated; if mixed with alcohol, it remains liquid, and, after standing, separates into a clear liquid and a white precipitate, composed in great part of albumen,

fibrine, and a considerable quantity of precipitated papaine. Alcohol precipitates from it crude papaine; this, after being washed in alcohol and ether, to remove fatty matters, is again dissolved in water. The precipitate from this solution is pure papaine, which, when purified by dialysis, has the composition of an albuminoid substance. Papaine, refined with the subacetate of lead, offers several distinctive characteristics, among which are: 1. It is very soluble in water, dissolving like a gum; 2. The solution makes a lather with water; 3. The solution becomes turbid in boiling, without coagulating; when it is curdy it sometimes leaves an insoluble residue in water; left to stand, the solution becomes turbid after some days, and a microscopic examination shows it to be filled with vibriones; 4. In the presence of a saccharine liquid, papaine acts as an alcoholic ferment with an extraordinary energy and promptitude, but the digestive property may be arrested by the application of benzoic or salicylic acid. The most important property of papaine, and one which puts it in the rank of the most powerful digestive ferments, is its action on meats. One part of papaine will digest and transform into soluble peptone from two hundred and fifty to three hundred parts of meat. Its solubility in different fluids allows it to be used in a great many pharmaceutical forms; and, being a vegetable juice, it can be preserved with more stability than animal ferments, and can be kept indefinitely when dry.

REPORT ON PHOTOMETRIC STANDARDS.—The committee appointed by the British Board of Trade to examine and report upon the different standards of photometric measurement which have been proposed for adoption, as well as upon the standard now used for testing the illuminating power of coal-gas, have made a report recommending the standard air-gas flame of Mr. G. Vernon Harcourt as the most exact and trustworthy. This flame is produced by burning a mixture of air with that portion of American petroleum which, after repeated rectifications, distills at a temperature of 50° C. or 122° Fahr. The portion is almost entirely composed of pentane, and is used in the proportion of one volume of pentane at 60° Fahr. to 576 volumes of air. The flame is brought to a height of two and a half inches with a burner a quarter of an inch in diameter. The light is quite uniform, the extreme difference obtained by two observers in nineteen observations being 0.3 of a candle, or 1.8 per cent. The committee found candles very objectionable as standards, and subject to a maximum variation in 115 determinations of 22.7 per cent between two pairs of candles. Messrs. Keates and Sugg's plan for burning sperm-oil with a two-inch flame from a circular wick was found subject to sudden variations; and Mr. Methven's system of allowing only a particular part of a three-inch coal-gas flame to pass to the photometer was not considered sufficiently exact for the work required of it.

COLOROMETRIC ESTIMATION OF CARBON IN IRON.—The great extension which has taken place in the applications of steel has made it desirable to obtain tests for the presence of carbon of a more minute degree of exactness than has heretofore been deemed sufficient. Professor Eggertz has described, in the "Jern Kontorets Annalen," a method of colorimetric estimation which is applicable to cases in which an exactness of 0.01 per cent is wanted. The basis of his process is the solution of ferric hydrate in nitric acid, to which a volume of water equal to that of the acid is added; when the quantity of acid used is commensurate with the proportion of carbon in the iron, the yellow-green color of the solution is cleared on adding an equal volume of water. Care must be taken that no chlorine is present, for the slightest trace of that substance gives a yellowish tint. The quantity of nitric acid required for solution is regulated to a certain degree by the supposed amount of carbon in the iron. For a solution with a lower amount of carbon than 0.25 per cent, 2.5 c. c. of nitric acid should be used for 0.1 gramme of iron; with carbon of 0.3 per cent, 3 c. c.; with carbon of 0.5 per cent, 3.5 c. c.; and for carbon of 0.8 per cent, 4 c. c. of acid. When the amount of carbon is altogether unknown, begin with 2.5 c. c. of nitric acid, and afterward add more as soon as the color of the solution or the amount of separated carbon shows that more acid is required. Too little acid gives too deep a shade, while excess of acid may be remedied by adding more water. The iron to be tested should be finely divided by filing, boring, planing, or crushing. The solution should be made at 80° C., with shaking of the tube. It is often more convenient to put the tube in boiling water; and speed can be gained at the expense of having a reddish-yellow film to deal with, by gently boiling the mixture. Special normal solutions, for comparison, are prepared in the same manner and graduated by successive dilutions from the normal, which represents 0.10 per cent of carbon per c. c. of 0.1 gramme of iron, and may be used for iron with 0.8 per cent and higher of carbon, down to the $\frac{1}{10}$ normal which represents 0.005 per cent of carbon, and is used for iron with from 0.04 to 0.08 per cent, or the lowest amount of carbon found. The distribution of the light in the room should be considered in applying the test, and it should be observed that a tube held on the right is generally a little weaker in color than one held on the left. The presence of manganese in the iron communicates a brown color, which is changed by heating to 100° C. to a weak red-violet; chromium gives a grayish blue; vanadium, a weak yellow; nickel, a green—all of which colors vanish under a greater or less dilution with water. Cobalt gives a red color which can not be regarded as absent till the dilution has extended to 40 c. c. Phosphorus, sulphur, copper, silicon, in the proportions in which they were tested by Pro-

fessor Eggertz, did not perceptibly affect the color.

A NEW VEGETABLE COLORING PRINCIPLE.—Messrs. S. P. Sadtler and W. L. Rowland have analyzed a new vegetable coloring matter found in the West-African wood called *beth-a-barra*, a wood which is much valued for its extreme toughness and its capability of receiving a high polish. The wood is compact, very heavy, and of nearly the color of black-walnut. On close examination the interstices of the fibers are seen to be filled with a yellow, crystalline powder. In this respect the beth-a-barra differs from logwood, barwood, camwood, and red sandal-wood, with which it was compared, in which the color is uniformly disseminated, and the fiber appears as if it had been soaked in a solution of corresponding color. The solution of the coloring matter obtained by extracting from the sawdust or raspings was treated for precipitation with acetic acid, and the pure substance was obtained by successive crystallizations from the alcoholic solution of the precipitate. The material thus gotten is a tasteless, yellow compound, apparently crystallizing in scales and needles, which are found under the microscope to be made up of a series of flat prisms, joined laterally. The crystals are unchanged in dry or moist air, insoluble in cold water, very slightly soluble in hot water, but readily soluble in alcohol and ether; they dissolve with a deep claret-red color in the presence of even a trace of alkali or alkaline carbonate, and melt at 135° C. Analysis gives a composition for the material dried at 125° C. which is represented by the formula $C_{22}H_{22}O_6$, or possibly $C_{22}H_{22}O_4$, and for that dried at 100° C., $C_{22}H_{22}O_6 + 3H_2O$. The beth-a-barra presents a similarity in many of its reactions leading to the suspicion of a relationship with chrysophanic acid and chrysarobin.

ACTION OF SEA-WATER ON CAST-IRON.—Professor A. Liversidge, of the University of Sydney, has made a study of the action of sea-water on cast-iron in the case of the screw of the steam-dredge Hunter, which became so rotten that it had to be removed. Even on the most cursory examination the specimen was seen to differ entirely from the original cast-iron, except in its shape, which remained unchanged. The material was so altered in composition that it might be safely described as a pseudomorph, since it was almost entirely made up of oxide of iron and particles of graphite. It was quite sectile, being readily cut with a knife. The powder under the microscope presented a mixture of brilliant scales of graphite with brown-colored oxide of iron and a few widely scattered minute particles of metallic iron. The external part of the specimen was of a dull-gray color, while within it was rusty brown, with dark bands following more or less closely the outer contour lines. The specific gravity was found to be only 1.63. Phosphorus appeared to have been completely eliminated by the

action which had gone on, and the amount of sulphur was quite small. Several notices of a similar transformation of cast-iron into graphite occur in the annals of chemistry, the oldest one dating as far back as 1740. Wrought or malleable iron does not appear to be subject to it. The plumbaginous masses thus formed frequently but not invariably become red hot and spontaneously inflammable on exposure to the air. The transformation is attributable to the local galvanic action set up between the diffused scales of graphite, films of slag, or other foreign matter contained in the iron. The coating of plumbago and rust is negative to the metal, and hence if left on assists in further corrosion; but the rate of corrosion, according to the observations of Mr. Robert Mallet, appears as a decreasing one when the coating first formed is removed prior to a second immersion. When cast-iron is exposed to the combined action of fresh water and sea-water, the action is said to be much more rapid, for the heavier sea-water below, and the lighter fresh water above, with the iron, form a voltaic pile having two liquids and one solid.

A NEW MINERAL, BEEGERITE.—Mr. George A. König has described and analyzed a new mineral from the Baltic lode of the Geneva Mining Company, Park County, Colorado, to which he has given the name of *beegerite*. The specimen on which the investigation was made was composed of quartz, about one half, and the new mineral in the two conditions of a light gray mass, and of crystals showing a darker gray color but exhibiting a very strong metallic luster, which were chemically identical with the gray mass. *Beegerite* forms minute crystals of orthorhombic habit; has a specific gravity of 7.273; acts before the blow-pipe like a mixture of galenite and bismuthite, with a small quantity of copper, and decrepitates; and is dissolved by concentrated hydrochloric acid, slowly in the cold, but rapidly in the heated acid. The analyses gave it a composition represented by the formula, $Pb_6 Bi_2 S_8 = 6 PbS + Bi_2 S_3$, with some copper. The compound exhibits properties nearly coinciding with those of galenite, and is qualitatively related with the two species, cosalite and schirmerite.

THE ALKALOID OF PITURIE.—Professor Liversidge, of Sydney, New South Wales, has extracted the alkaloid principle of piturie, a vegetable substance obtained from a species of *Duboisia*, of the order *Solanaceæ*, which is chewed by the Australian natives, and exerts an action similar to that of tobacco. Baron von Mueller and M. A. Ladenburg had previously experimented with the alkaloid, but their accounts of it do not agree. As prepared by Professor Liversidge, by distillation of the plant with caustic soda, solution in ether, and removal of the ether by distillation, the alkaloid, piturine, is at first clear and colorless, but becomes yellow and finally brown with access

of air, especially when exposed to sunlight. If air is excluded it will remain unchanged for a long time. It is soluble in all proportions in water, alcohol, and ether, yielding colorless solutions, and produces a greasy stain on paper, which disappears after a time. It is a little heavier than water, is volatile at ordinary temperatures, giving a vapor which forms a dense fog with hydrochloric acid, irritates the mucous membranes very much, and induces violent headaches in those working with it. Its taste is acid and pungent, and very persistent; its smell when fresh is very like that of nicotine, but after it has become darkened is more like that of pyridine. It neutralizes acids completely. Its composition is represented by the formula $C_6H_5N_{14}$.

CULTIVATION OF NITRIC FERMENTS.—Mr. R. Warrington has communicated some preliminary results of a course of experiments he has been making on the conditions in fermentation which respectively determine the formation of nitric and nitrous acid. When a small quantity of fresh soil is employed to seed solutions of chloride of ammonium supplied with nutritive ingredients, a pure, or nearly pure, nitric fermentation is obtained if the solution is sufficiently shallow and dilute, and the temperature low. Under such circumstances only a trace of nitrous acid is formed, and this changes into nitric acid before the conclusion of the action. If the solutions employed are much more concentrated, or the temperature is considerably raised, large quantities of nitrous acid are produced. In all cases in which soil has been used as seed, the nitrous acid exists only temporarily in the solution, the final product of the fermentation being always nitric acid. Soil added to a solution of nitrite of potassium, supplied with nutritive ingredients, readily converts the nitrite into nitrate. When solutions which have been seeded with soil and have undergone the nitric fermentation are themselves employed as seed for new solutions of ammonia, the final result as before is nitric acid, provided the solution used as seed is only a few months old. With older solutions the result of the fermentation is apparently only nitrous acid, which does not further change into nitric acid, except when, as sometimes occurs, a white organism, a bacterium, after a considerable time, appears on the surface of the liquid, and spreads, under favorable circumstances, to cover it. When a solution which has undergone the nitrous fermentation is used as seed, it again produces a purely nitrous fermentation. These results accord with the fact noticed by Pasteur, that the energy of infectious organisms may be reduced by cultivation. The nitrifying ferment appears, then, to exist in the three conditions of the nitric ferment of the soil, producing nitrates; the altered ferment producing nitrites; and the surface organism, which changes nitrites into nitrates.

RELATIONS OF BACTERIA AND VARIOUS GASES.—Mr. F. Hutton has made some experiments to

ascertain the nature of the action exerted by various gases on the life and increase of bacteria, and what influence the bacteria have on the percentage composition of the gases. The organisms, obtained from a meat-extract, flourished well in atmospheric air, pure hydrogen, pure oxygen, and a mixture of carbonic oxide, carbonic anhydride, oxygen, and nitrogen, absorbing oxygen and developing more or less of carbonic anhydride, with an apparent evolution of hydrogen and nitrogen in the latter experiment. Cyanogen seemed to be fatal as such to the organisms, but they appeared to revive, especially in the sunlight, after it underwent decomposition into ammoniac oxalate. The bacteria lived well in sulphurous anhydride, nitrogen, nitrous oxide, nitric oxide, carbonic anhydride, a mixture of hydrogen and oxygen obtained by the electrolysis of water, coal-gas, and a solution of urea and phosphate of potash. With spongy iron and air, the bacteria vanished, and the air when analyzed consisted of N 99.74 per cent, CO_2 0.26, and no oxygen. Acetylen, salicylic acid, strychnine, morphine, narcotine, and brucine, had no effect on the bacteria. Phenol, spongy iron, alcohol, and potassium permanganate, were very destructive to them. Mr. W. M. Hamlet has found that bacteria can exist in carbonic oxide, hydrogen, one-per-cent creosote, phenol, methylamin, methylic alcohol, and chloroform, and Mr. Grace-Calvert has found that they can live in strong carboic acid. The evidence of other observers is to the effect that the virulence of fever-producing liquids is destroyed by chlorine and sulphurous acid; and this suggests the query whether the organic matter to which they owe their power may not be essentially different from the bacteria described by Mr. Hatton.

ACTION OF INORGANIC SUBSTANCES ON THE CIRCULATION OF LIVING ANIMALS.—Dr. James Blake has been led, by the results of a long series of researches on the phenomena elicited by the direct introduction of inorganic matter into the circulation of living animals, to the conclusion that the intensity of the physiological action of such matter increases in direct ratio with the atomic weight. The action of salts of forty-one elements was tested upon horses, dogs, cats, rabbits, geese, and hens, with identical results. The different groups of metallic elements—monads, dyads, triads, and the rest—formed series in each of which the increase of activity corresponding with the rise of the atomic weight was manifested with striking regularity. Among some peculiar features of the experiments were that chlorine, bromine, and iodine agree closely in their physiological action—showing, however, a decrease instead of an increase in intensity; that phosphorus, arsenic, and antimony do not induce any immediately perceptible physiological reaction; and that the salts of potassium and ammonium, the latter of which produce results resembling those of certain nitrogenous alkaloids, exhibit the only exceptions to the rule that isomor-

phous substances act in an analogous manner.

FREE FLUORINE.—Fluorine occupies a peculiar position among the elements the existence of which is satisfactorily established, in that it has never been isolated. This arises from the fact that its chemical affinities are so powerful that when it is released from any of its compounds it instantly attacks and combines with any material out of which it is practicable to make a vessel for the experiment. Loew has very recently announced that he has discovered what he supposes to be free fluorine in a variety of fluor-spar found at Wolsendorf in Bavaria, which is of a dark-violet color, and emits a peculiar odor. The origin of the odor has not hitherto been satisfactorily explained. Loew believes it to be due to fluorine existing free within the mineral, and has made some experiments which appear to bear out his conclusion.

ABSORPTION OF NITROGEN BY IRON.—Professor Ira Remsen has had his attention called to a power manifested by iron, under certain conditions, of exhibiting the reactions of nitrogen. He was making experiments to verify the applicability of the method of Lassaignac for the detection of nitrogen in bodies containing carbon to compounds in which sulphur is present, when, working with a fusion of a compound which had been proved to contain no nitrogen with sodium and iron by hydrogen, he perceived the blue precipitate revealing the presence of nitrogen to be distinctly formed. The experiment was repeated several times, with the same results, while the tests which were applied showed that all the substances operated with were free from nitrogen. Another specimen of iron by hydrogen, which had been kept for several years, and which did not take fire by contact with the air, failed to give the nitrogen-test. This led Mr. Remsen to believe that nitrogen was absorbed from the air by iron, under some power connected with its active condition. Further experiments gave results, both of a positive and negative character, agreeable to this view, so as to induce a confident statement of the conclusion that when iron by hydrogen and certain non-nitrogenous organic substances are heated together with metallic sodium in an atmosphere of nitrogen, a cyanide is readily formed. The action is similar to that which takes place in blast-furnaces when formation of cyanide of potassium takes place. Experiments made with Bessemer steel and other forms yielded results corresponding with those referred to above.

ARSENIC IN WALL-PAPERS.—Mr. Harry Grimshaw, F. C. S., of Manchester, England, has called attention to the presence of arsenic in paper-hangings of other colors than green, which were obtained from the recent stock of a manufacturer in Lancashire, with the assurance that they contained no arsenic. Six specimens of as many different colors, including three greens of different shades, light brown, dark brown, and pink, all contained

arsenic in considerable proportions—the pink, which had the least, having enough on a square foot to poison an adult person. By the side of these papers were placed, for comparison, six other samples obtained from another manufacturer, the colors of which could hardly be distinguished from those of the arsenical papers, but which were wholly free from arsenic. From these and other papers which were compared with the same object, it was found that almost any color that may be desired can be obtained without the addition of that substance. If any difference exists in the appearance of the arsenical and non-arsenical colors, it is that the former are rather brighter. This, however, is not altogether a merit, for wall-colors may very easily be too bright. It is still undetermined whether the cheaper or more expensive papers usually contain more arsenic, and also in which class it is more commonly found.

AMMONIA IN HUMAN SALIVA.—Mr. B. H. Heyward, of the laboratory of the University of Virginia, has made some researches into the presence of ammonia in human saliva. Evidence of the presence of the alkali was obtained by observing the action of heated oxide of magnesium upon filtering-paper moistened with the Nessler reagent. The paper showed a distinct orange tint when saliva was present, but was not affected when the saliva was omitted. In all of nineteen different cases examined, of as many young men in good health, the ammonia reaction was obtained. In ten of the cases the amount was approximately determined to be in proportions varying from thirty to one hundred milligrammes of ammonia per litre of saliva. The proportions in the mixed saliva of a single person varied, on seven successive days, between forty and sixty milligrammes per litre. Special experiments directed to the different salivary glands indicated that most, if not all, of the ammonia came from the parotid and submaxillary glands, the latter furnishing notably the larger share, and that the source of ammonia—at any rate, the sole or chief source—is not to be found as free gas in the expired products of respiration condensed in aqueous solutions in the mouth.

GUM-LAC FROM ARIZONA.—A resinous substance has been found widely distributed throughout Arizona and Southern California, where it forms a coating of considerable thickness on the twigs of the *Larrea Mexicana*, or "greasewood," which exhibits the cellular cavities containing ova of insects, and at certain seasons a red fluid, and other characteristic properties as to color, solubility, the color given to different solutions, action under the influence of heat, and odor, of the gum-lac of India. An analysis of the substance, by J. M. Stillman, of the University of California, gives its composition as consisting of 61.7 parts of resins, 1.4 of coloring matter soluble in water, 26.3 of caustic potash extract, 6.0 of insoluble residue, with a loss (including some coloring matter) of 4.6.

This shows a near correspondence, as to essential elements, with the composition of the Indian shellacs. A gum is also found, but in smaller quantities and having a less amount of coloring matter, on the twigs of the *Acacia Greggii*, which resembles the lac from the *Larrea* in its general appearance and irregular cellular structure, as well as in its essential chemical properties, and behaves in the same manner toward chemical reagents.

THE FREEZING-POINT OF ALCOHOLIC MIXTURES.—Researches which have been made by M. Raoult, of the Faculty of Sciences at Grenoble, on the point of congelation of alcoholic liquors, show that the point at which mixtures of alcohol and water begin to freeze falls as the proportion of alcohol becomes stronger. M. Raoult has made a table of the points of congelation for different mixtures, by a comparison with which the strength of any given mixtures may be determined by subjecting them to the freezing-test. Fermented liquors congeal at a temperature a little lower than mixtures of alcohol and water of the same strength, the difference increasing as the proportion of alcohol becomes stronger. In all cases the ice consists of pure water, wholly free from alcohol. Hence the part of the liquid left unfrozen is richer than the original liquid, and it follows that the point of congelation descends as the congelation progresses.

A NEW THEORY OF STEEL.—Mr. W. Mattieu Williams has proposed a new theory to account for the temperability of steel. It is well known that, if steel is heated red-hot and suddenly cooled, it becomes extremely hard and brittle; if heated again and slowly cooled, it becomes almost as soft and tough as wrought-iron. If it is moderately heated, it becomes partially softened or "tempered," in proportion to the temperature to which it is raised. None of these properties is possessed by either of the materials, carbon or iron, of which the steel is composed. Mr. Williams's theory is based on the fact that there exists a definite compound, consisting of four equivalents of iron to one of carbon, which may be obtained in crystals, and which is more fusible than ordinary steel, and far more fusible than iron, and is excessively hard and brittle, but not temperable like steel. When it is melted at a temperature at which iron is quite infusible, it is capable of dissolving iron, and forming a liquid mixture. When such a mixture is cooled below the solidifying point of one of the substances, while its temperature is still above that of the other, then one must be still fluid while the other is striving to solidify. "If the cooling beyond this goes on slowly, the molecular conflict will have time to settle itself; but, if the cooling is effected suddenly, there must be a 'molecular strain,' due to the inequality of contraction of the different parts of the solid and the liquid portions of the mixture, the internal fluid movements necessary for the adjustment of this irregular contraction of the different parts

of the substance being arrested by the sudden solidification of the whole. We should thus have a solid with its different parts pulling against each other, or set in rigid grasp, or a state in which the opposite character and fluidity or mobility of particles would be excessively developed. This would be excessive solidity, or hardness and brittleness. The molecular strain must be still more severe in the case of a substance which goes on contracting as it approaches the temperature of solidification, and then suddenly expands as it assumes solidity. This is the case with iron." Repeating the heating process would relax the mutual grasp of particles in proportion to the development of that viscosity which is one of the characteristics of heated iron; and steel is tempered at a point approaching the "welding-heat" of iron.

CHILI (REPÚBLICA DE CHILE). To the general statements of area, territorial division, population, etc., given in preceding volumes,* it may here be added that the population on January 1, 1879, has been reported at 2,155,029.

The President of the Republic is Señor Don Domingo Santa-María, inaugurated September 18, 1881, for the usual term of five years.

The Cabinet was composed, June, 1881, of the following ministers: Interior, Señor Recabarren; Foreign Affairs and Colonization, Señor Valderana; Finance, Señor Don J. Alfonso; Justice, Public Worship, and Public Instruction, Señor García de la Huerta; and War and the Navy, Señor Don J. F. Vergara.

General Baquedano, the distinguished commander-in-chief of the Chilian forces in the Chilo-Peruvian War, had been nominated as a candidate for the presidency, but withdrew his candidature. Señor Santa-María had the portfolio of Foreign Affairs in 1880.

The regulation strength of the army in time of peace was fixed by Congress, in 1875, at 3,573 men, deficiencies to be made up by conscription. The regular army, at the time of the latest returns before the commencement of the war with Peru and Bolivia, comprised 712 horse, 2,000 foot, and 804 artillery, with 749 officers of all arms; 7 generals, 14 colonels, 54 lieutenant-colonels, 67 majors, 182 captains, and 425 lieutenants; constituting a total of 3,516. The National Guard consisted of 1,215 horse, 21,147 foot, and 1,925 artillery; total, 24,287. But, on war being declared, the regular army was raised to a strength of 20,000, distributed in three divisions, and the National Guard to 30,000; thus forming a total land-force of 50,000. A single number of the "Official Gazette" was said to contain, in October, 1880, eleven decrees relating to the formation of as many new corps, with an aggregate of 20,000 men.

In an official report published in the second half of 1880, the navy was stated to comprise 11 ships of war, 12 transports, 3 pontoons, and 2 launches (torpedoes)—in all, 28 craft; with an

aggregate of 20,107 tons, 5,459 horse-power, an armament of 83 pieces of cannon, 224 naval officers, and 1,686 seamen; besides six marine officers, commanding 389 marines. In the above number of vessels were included six mail-steamers chartered by the Government until the end of the war, and equipped by their owners.

Touching the question of finances, the most reliable information at hand is that derived from President Pinto's message to the Chilian Congress under date of June 1, 1881. The revenue, ordinary and extraordinary, for the year 1880, was in that document set down at \$43,992,584, and the expenditure at \$43,123,829; the latter sum being only approximate, "inasmuch as, out of the extraordinary number of accounts arising from the war, it is but natural that many should still remain unsettled, the amount of which is not precisely known; as, for instance, the outlays made by the legation in France for military and naval supplies." The ordinary revenue for the year referred to stood at \$27,992,584, while the total revenue, ordinary and extraordinary, for 1879, was but \$27,693,087. It is true that in the revenue for 1880 was included the sum of \$2,500,000 derived from an "accidental source"—the redemption of annuities; and the proceeds of the sales of nitrates, amounting to \$4,000,000 up to October 2, 1880, after which time "this latter source of income was replaced by the export duty, which, besides being almost equal in amount, possesses the advantage of facility of collection without the inconveniences attending mercantile operations." The Tarapacá nitrates, just referred to, yielded considerable sums to the Government, for account of which they were worked until October 2, 1880, as stated above, the sales having been effected first by auction and afterward by British consignees. The working of the guano deposits having been retarded by scarcity of laborers, transactions in that commodity had been limited, the quantity exported up to June 1, 1880, not having exceeded 40,000 tons. The guano shipments were in accordance with the terms of the decree issued by the commander-in-chief of the army on February 22, 1880. In conformity with the act of September 2, 1880, all the stocks of the monopoly office had been disposed of, and the offices established in its stead were working satisfactorily. As, however, these offices were of a temporary character, the President announced his intention of submitting a bill to Congress for their organization on a permanent basis. The issue office had emitted, up to the middle of May, 1881, \$10,626,000, in exchange for a corresponding amount in treasury notes. The total value of notes issued, including the amount on hand, was estimated at \$12,000,000, which, with \$13,000,000 in bank-notes, constituted an aggregate of \$25,000,000 in circulation: an amount of paper that might under ordinary circumstances appear to be excessive, but

* See "Annual Cyclopædia" for 1879.

which was, "in reality, hardly sufficient to meet the requirements of the service now performed by the Chilean paper money, not only at home, but in a considerable portion of the South Pacific coast." The Government was represented as holding, at the date of the message, a sufficient quantity of fiscal notes to replace the entire issue of treasury notes, which, though reduced by rather more than one-third, amounted to \$26,000,000, of which \$12,000,000, deposited in the national Treasury, were bearing interest at 5 per cent, pursuant to the terms of the law of August 19, 1880.

After stating that the custom-house yield for 1880 had exceeded that for 1879 by nearly \$4,000,000, President Pinto remarks, as noteworthy, that such increase was owing to "new markets, and to increased production and consequent development of consumption.

"In the new territories successively occupied by our troops, custom-houses have been established with a view to make the war self-supporting, as far as the unhinged condition of affairs in those regions will permit. With the reduction of the national expenditure to the requirements of a normal situation, taking into consideration the gradual increase of the revenue, and the resources drawn from the conquered country, together with those to be derived from the ultimate permanent occupation of the Araucanian territory (which occupation renders urgent and indispensable the passage of the bill now before you relating to the ownership of the land in that territory), we have the encouraging conviction that the expenses of the war will be defrayed without further sacrifices. So far the Government has not found it necessary to make use of the bill recently passed for a new issue of \$12,000,000, and I believe recourse thereto will not be required in the present month. Nevertheless, care and economy in new outlays are essential to the establishment of our finances on a sure foundation that shall enable us to redeem, at an early day, our paper money, and return to specie currency."

The expenses of the war, up to the middle of 1881, have been reported, on the authority of the Chilean Minister to Washington, at \$60,000,000. Further particulars concerning the war debt and the means for paying it off were given in our volume for 1880 (article CHILI, p. 97, *et seq.*). Reference may be made to the same volume for a detailed statement of the several loans, etc., constituting the national debt of Chili, which debt was officially reported as follows, on January 1, 1880:

Home debt.....	\$27,712,543
Foreign debt.....	34,870,000
Paper money.....	12,000,000*
Total.....	\$74,582,543

The foreign trade of the republic for 1879 was, according to first returns,† of the total value of \$59,360,226, of which \$36,620,226

represented the exports. But in a later official report the exports were set down at \$42,657,839, and the imports at \$23,226,781: total, \$65,884,620. It should here be remarked that in the latter total is included that of the exports and imports at the new port of entry—Antofagasta—\$5,464,991, and \$432,173, respectively. Thus the value of the exports for 1879 exceeded that of the imports by \$19,431,058, a result very largely contributed to by the splendid wheat-crop of the year in question. The quantity of wheat exported, mainly to Great Britain, in that year, was 142,182,985 kilogrammes.

The special trade of the republic in 1880 was of the total value of \$81,404,539—exports, \$51,083,810; imports, \$30,320,729: balance of trade in favor of Chili, \$19,763,081. Included in the exports were agricultural products of the total value of \$11,661,067, against \$12,781,394 for 1879; and minerals of the total value of \$37,250,973, against \$26,248,726 for 1879. The wheat-crop was exceptionally unfavorable in 1880.

The custom-house yield for the ten months of 1880 ending October 31st reached \$7,594,891, against \$6,845,731 for the whole of the year immediately preceding.

The value of the annual exports of copper—the great Chilean staple—to Great Britain, is estimated at from \$12,500,000 to \$15,000,000.

The imports from Great Britain in 1880 were as follows:

Cotton fabrics.....	\$4,423,875
Woolen fabrics.....	286,210
Linens.....	145,285
Railway iron of all kinds.....	178,545
Cast and wrought iron.....	184,790
Total.....	\$5,123,205

According to the report of the Bureau of Statistics of the Treasury Department, the exports from the United States to Chili for the fiscal year 1879 amounted to \$1,254,000, a decrease of \$723,000 from the preceding year, while the imports from Chili into the United States during the same period amounted to \$643,000, a decrease of only \$20,000 from the preceding year. The trade of England with Chili during the year 1878 was as follows: Imports from Chili, \$10,692,000, a decrease of nearly \$12,000,000 from the imports of 1874, which occurred principally in copper, wheat, and flour. Exports to Chili, \$6,000,000, a decrease of nearly \$8,000,000 from the exports of 1874. As the decrease herein noted in the trade of England with Chili is confined to no single year, but runs consecutively through all the intervening years, it shows a steady decline in the trade between both countries. The exports to Chili from England are composed principally of the following articles: cotton manufactures, \$2,466,000, a decrease from the cotton exports of 1874 of nearly \$2,000,000, and of 20,000,000 yards; wearing apparel, arms, ammunition, bags and sacks, beer, ale, coal, earthen and china ware, glass-ware, leather and manufactures of, linens, jutes, machinery, metals and manufactures of, paints, woolens, etc.

The trade of France with Chili during the year 1878 was as follows: Imports from Chili, \$3,000,000, about the same as the imports of 1874; exports to Chili, \$3,500,000, a decrease of \$4,000,000 from the exports of 1874. The principal exports from France to Chili, during the year 1878, in the order of their value, were as follows: Refined sugar, leather and manufactures of, woolen goods, cotton goods, mercery and buttons,

* \$25,000,000 in June, 1881. (See *ante*, p. 101.)

† See "Annual Cyclopædia" for 1880, p. 99.

wearing apparel, wines, paper, pottery and glassware, fish, olive-oil, tools and implements, liquors, felt hats, medicines, jewelry, watches and clocks, etc. During the year 1877, according to the report above quoted, there entered at and cleared from Valparaiso 827 steamers, of 798,656 tons, 1,319 sailing-vessels, of 648,712 tons, a total of 2,146 vessels, of 1,447,368 tons. The United States was represented in this fleet by 63 sailing-vessels. Of the steamships, 36, of a tonnage of 126,000 tons, entered the port direct from Liverpool, *via* the Straits of Magellan. Herein lies the secret of England's large trade with South America.

The following extract from the official organ of the Chilean Government will be found to contain significant considerations on the commercial relations of Chili with the United States:

From the data collected, systematically arranged, and published in the yearly reports of the Bureau of Commercial Statistics, it appears that Chili imported from the United States in 1856 assorted merchandise to the amount of \$2,439,153, and in return exported her own agricultural and mining products to the markets of the United States to the amount of \$3,090,899. Our business thus, in that year, with the great republic aggregated the respectable sum of \$5,530,052, an amount certainly greater than its commerce with any of the other republics of this continent. Nevertheless, in the course of twenty-four years only, this condition of things has totally changed, to the great detriment of both nations. While the commerce between Colombia and the United States reaches the sum of a little over \$7,000,000 per annum, and with Venezuela exceeds \$11,000,000; while her commercial relations with the far-off Argentine Republic and the petty republics of Central America are every day assuming greater importance, our commercial statistics hardly make any record of trade, and this record only shows a trifling amount of the commerce between Chili and the United States, which in other times was so active and profitable. The decline is shown by the following official figures: In 1860 importations from the United States had fallen from \$2,500,000 to \$1,085,000 in round numbers. Three years later, our exports of copper and ores still amounted to \$1,250,000, while the imports of American products amounted to about the same sum. In 1868 the decrease was still more noticeable: our exports scarcely reached half a million, or \$400,000 less than in 1844, in which year the United States were purchasers from us to the amount of \$956,052. From 1874 to 1878 trade continued in the same depressed condition, and it is but reasonable to suppose that the fluctuations in exchange, and difficulties in obtaining exchange, will have, during the course of 1879 and the present year, still further reduced the figures representing the commercial intercourse of the two peoples. In the tables of commercial statistics, which we may properly call a journal of our progress, the total of the trade between Chili and the United States, during a term of twenty-two years, from 1844, is set down at the respectable sum of \$88,780,000; what will be the insignificance of the total for an equal period of time reckoned from 1866 may be easily calculated from the data we have already given, and it is no rash assertion to say that, if the causes which have led to this decay be not considered and some remedy applied, the day will soon come when trade between Chili and the United States will be but a sad reminiscence of our commercial statistics. It is but proper to add, in support of our observations on this decay, that the same is observable with other countries, the Argentine Republic, Ecuador, and Colombia, with which, at a period not very remote, and under circumstances much less favorable for developing and increasing trade, our own country had an active and mutually advantageous commerce.

The causes that, within the last twenty-four years, have led to this extraordinary decay in the commerce of Chili with the United States are apparent.

The astonishing development of the agricultural interests in the old mining regions of California, together with the fact that there, on rich and virgin soil, scientifically cultivated, are produced the same articles raised by us here on worn-out soils, imperfectly cultivated without the aid of fertilizers, constitutes the first and most conclusive of such causes. Not only have our cereals been driven out of the advantageous markets of California, but by the products of this same California they have been supplanted in other markets, which, but a short time since, were our own. United States flour to-day finds its way to Central America, Panama, Ecuador, and occasionally has reached even our own country to supply the deficit created by bad crops, unwise commercial calculations, or our imperfect methods of planting and gathering our crops. It is not singular that in San Francisco Chili flour should be no longer used, inasmuch as that essentially agricultural land produces wheat with such wonderful profusion; but it is very singular that the wheat of California, which is, as it were, but of yesterday, should have absolutely driven Chilean wheat, of long standing and high repute, out of all the markets of the Pacific coast. Our inability to enter into competition with it indicates the existence of questions to be resolved with regard to low rates of interest, the use of agricultural implements in planting, of fertilizers, and means of transportation. These questions must be considered in the light of the requirements of our agricultural interests. If, however, there are reasons why California, so far from buying wheat from us, brings her own extraordinary production of this article into competition with our own, such reasons totally fail when we come to consider other articles which, twenty-five years ago, we exported to the markets of the United States, and to a very considerable extent. Why is it, then, that the United States are no longer purchasers of our copper? Why is it that they have ceased to work up our wool? In 1866 we exported to the United States \$1,000,000 worth of these two articles; in 1862, \$1,943,429; and in 1863, still \$823,600. This trade, far from tending toward an increase, seems to be on the verge of disappearing. Is it, then, because the United States produce all the copper they require in their manufactures and ship-building? Most certainly not, if we are to believe their own statistics and the reports of some of the branches of their manufactures. The yield of copper in the United States is not sufficient for their consumption, and it is necessary to import from England part of that which England receives from Chili. As may be naturally supposed, this reaches the hands of the consumer in the United States with an addition of the charges for the increased freights, expenses, and profits of the first purchaser. The same, or something very nearly so, though perhaps on a smaller scale, occurs with regard to our wool. All this is due to the protective, or rather prohibitory, tariff which the Government of the United States have put in force, more particularly since 1863, when they were called upon to meet the expenses of their tremendous war of secession.

Commerce is nothing more than an interchange of products; and in order that we may become consumers of the manufactures of America, it is indispensable that our products should have easy access to the markets of that country. Drawing against England, as has been the case up to the present time, it is not probable that we shall be purchasers to any great extent of the goods offered to us. Upon such a basis of trade, and however advantageous the prices might be, it would be impossible for them to compete with similar productions from other countries. England, which buys our copper and wool, can always sell us her cutlery and hardware on advantageous terms, for financial reasons that from their obviousness it is not necessary here to state. It is not, then, through the means of education pursued by the State, or the intelligence of the American manufacturer, that the problem of establishing extensive commercial relations between

the two countries is to be solved. Let the manufacturers begin by making their own markets accessible, and asserting the principle of free interchange, without which unlimited production is simply ruinous. Let them seek to exchange for our copper and wool upon equitable terms, as in former times; then may they certainly reckon upon us as permanent consumers of their products. We will pay them for their machinery, hardware, and dry goods with our wool, niter, and copper. Efforts to augment the various agricultural and manufactured products of a country within the natural limits imposed by soil, climate, geographical position, and the grade of civilization enjoyed, are always laudable.

The attitude assumed by the Chilian Government toward the holders of Peruvian bonds was alluded to in detail in our volume for 1879. The following extracts from the London "Times" and from a British financial journal will throw the necessary light upon that question as it stood in the summer of 1881. It may be added that, down to the end of that year, little hope was entertained by the most sanguine of an early dividend. The net proceeds of thirteen cargoes sold on account of the Chilian Government, and to be applied in favor of the bondholders, was reported by the London consignees to amount to but £17,828 10s. 1 The total claim represented by bonds is £32,000,000.

With regard to the reports in the market to the effect that the Chilian Government are going to assume the burden of the Peruvian debt at a smaller rate of interest, the truth appears to be that some large bondholders here, seeing that the committee are practically impotent and that some other combination must be formed to protect the bondholders, have made a proposal to the Chilian minister to accept what, in fact, is a composition, the bondholders agreeing in return to renounce all their rights. The Chilian minister, we believe, is inclined to listen to the proposal, whatever it may be, but nothing can be done now respecting it without conferring with Messrs. A. Gibbs and Sons, with whom communications have been opened. In any case the Chilian Government are not likely to agree to any arrangement which would cause them loss, which would probably be the result of their promising to pay £2 per cent on the Peruvian debt. The most favorable estimate by the best judges is that there will not be a net revenue from the guano sales of more than one per cent on the total amount of the Peruvian debt, and the realization of even that amount depends upon the possibility of obtaining sufficient guano of a marketable quality. On this head very considerable doubts are entertained.

There has been a great deal of excitement in Peruvian bonds on the circulation of various rumors which seem to be mostly devoid of authority. It is eminently improbable that the Chilian Government will adopt the course which some ardent admirers of its generosity have been suggesting. There is no reason that we can see why Chili should take upon her the Peruvian debt, and guarantee two, or any, per cent to the bondholders. She does all she can fairly be expected to do when she gives the bondholders access to the property hypothecated to them in security for the foreign debt of Peru. Sanguine views have, however, been in the ascendant, and the price of the bonds has had a substantial rise. There is this much to be said in their favor, that even at one per cent (if it were sure) the bonds would be cheap at their present market quotations. Calculating on the basis of the vessels chartered and loading, on their way or arrived, allowing for only twenty more ships during the rest of the year, nearly two per cent on the loan

would, it is said, be within sight. There is, we agree with a correspondent of a contemporary, something more tangible in the prospect here than we have at present with the Turks. But no progress—we would remind this correspondent and other critics—is likely to be made by indulging in mere abuse of the committee of Peruvian bondholders. The letter from that body, which we publish elsewhere, proves their anxiety to have done with controversies and wrangling with the Chilian Government or any one else. But it is mere fatuity to call in question the credentials of the committee, or to speak of them as "impotent." Never was a committee appointed by a more indubitable vote. Out of a total of £32,000,000 bonds no less than £26,000,000 were registered or deposited, and £21,000,000 were voted on. The fact that the bondholders paid the assessment on their bonds sufficiently demonstrates how much they were in earnest in the matter, and how little foundation there is for the attempt to discredit their committee on the authority of anonymous "large" bondholders. If there was any pressure put on the bondholders to deposit their bonds and vote, it was applied by the Chilian minister, who caused it to be announced that their not registering or depositing would deprive them of their right to participate in the proceeds of the sales of the guano. The attacks on the committee are baseless clamors.

The subjoined additional extract from the message read by President Pinto at the opening of the Chilian Congress on June 1, 1881, will serve to complete the sketch of affairs in that country in that year:

FELLOW-CITIZENS OF THE SENATE AND CHAMBER OF DEPUTIES: It affords me pleasure to be able to inform you that our relations with friendly powers are on a footing of perfect cordiality.

A slight modification which circumstances appeared to me to warrant has taken place in our relations with Spain.* You are aware of the eagerness with which Peru and Bolivia hastened to sign a treaty of peace with Spain, in the belief that by this means they would be able to obtain warlike elements to use against us. The Peninsular Government, after entering into a treaty of peace with our enemies, maintained, however, the strictest neutrality, notwithstanding that the truce with Chili subsisted and still subsists. In conformity with this lofty policy, it ever showed itself disposed to deny to our enemies all favors which it could not grant to us also. These antecedents, added to the friendly attitude assumed by the Spanish community at Iquique on a sad occasion, induced me to think that it would be proper to show that, on our part, we were not insensible to these conciliatory actions. Believing, therefore, that I faithfully interpreted public feeling in the matter, I issued the decree of January 31st last, opening our ports to Spanish vessels. In conformity with the law of January 12th of last year, which empowered me to give in the adhesion of Chili to the Postal Union, I applied, diplomatically, to the Swiss Federal Council for the incorporation of our country into that convention from the first of April of this year.

While devoting, as you may suppose, particular attention to the requirements of the war in which we are engaged, the different branches of the public service have not been neglected.

The advancement of our frontier, both north and south, has rendered necessary the creation of new provinces and departments, and several bills having this object in view will shortly be submitted to you.

The public roads have been duly attended to with the sums provided for in the estimates, and with private donations. I have issued decrees giving to the inhabitants of provinces some participation in road affairs, which will have the effect of improving the

* A treaty of peace between Chili and Spain, after fifteen years' interruption, was concluded in 1881.

management of those matters, and will be a guarantee for the legitimate outlay of the money expended on them.

Important improvements have been carried out on the existing lines of telegraph for the purpose of affording greater facility for communication.

The prolongation of the line of telegraph to Ancud is being actively pushed on, and in a few days more the forts lately constructed in Aruco will be connected with the rest of the republic by telegraph.

In conformity with the provisions of the act of January 14th of the present year, surveys are being made for the plans and estimates of a railway from Angol to the province of Valdivia, and at an early date I shall apply for power to commence work on the first section of that line.

A bill, framed by the committee charged with the revision of the civil code of procedure, providing for the resort of cassation, will be laid before you.

The Council of Education is discharging its labors with commendable zeal, and it has submitted to the government plans of studies for the course of "humanities" and mathematics, and a plan of examinations for use in superior and secondary educational establishments.

Notwithstanding that during last year the war attained its greatest spread and development, trade has continued its regular and progressive course. The circumstance of our having been able to carry military operations into the enemies' territory from the very commencement of hostilities, thanks to our naval superiority, a fact worthy of being remembered in everything relating to the security and future of the republic, has, by maintaining open their sphere of action, been the cause of trade and industry having been free from uncertainties and fears which would have paralyzed or hindered their progress. On the contrary, the war itself, by its constant successes, has opened up new fields to enterprise by the conquest of extensive territories which have been sources of revenue to the state, and of labor and wealth for private individuals.

(For treaty of limits, see ARGENTINE REPUBLIC; and for narrative of the war, PERU.)

CHILI, PERU, AND THE UNITED STATES.
(See PERU, CHILI, AND THE UNITED STATES.)

CHINA, an empire in Asia. Emperor, Kwang-Su, formerly called Tsaetee, born in 1872, a son of Prince Ch'un, and grandson to the Emperor Tau-Kwang, who died in 1850; he succeeded to the throne in 1875.

The area and population of the provinces of the empire were estimated as follows in 1880:

PROVINCES.	Square kilometres.	Population.
Chihli*	148,857	28,000,000
Shantung*	180,282	20,000,000
Shensi.	170,853	17,056,925
Honan.	173,350	20,069,771
Kiangsu*	103,959	37,500,000
Nganhwul*	139,575	84,200,000
Kiangsi*	177,656	23,000,000
Fokien and Formosa*	157,320	14,500,000
Chihkiang*	92,383	26,900,000
Hinpeh*	179,946	27,400,000
Hunan.	215,555	20,045,969
Shensi.	210,340	10,809,769
Kansuht.	674,923	9,235,377
Szechuen.	479,263	85,000,000
Kwangtung and Hainan*	269,923	19,200,000
Kwangsi.	201,640	8,121,327
Yunnan.	517,162	5,829,670
Kweichow.	172,593	5,679,128
Total China proper.....	4,024,660	880,000,000

* According to "Reports on Trade at the Treaty Ports for the Year 1879." By the Inspector-General of Customs, Shanghai.

† Population in 1880, according to official reports in "Deutscher Reichs-Anzeiger," April 25, 1881.

The area and population of the other parts of the empire were as follows:

COUNTRIES.	Square kilometres.	Population.
Mantchooria.....	963,880	12,000,000
Mongolia.....	8,377,283	2,000,000
Thibet.....	1,687,898	6,000,000
Soongaria.....	404,500	600,000
East Turkistan.....	1,118,713	580,000
Corea.....	236,784	8,500,000
Total tributary countries.	7,759,058	29,680,000
Total Chinese Empire...	11,813,750	409,800,000

The estimates of the population of Peking vary between 500,000 and 1,650,000. The population of the treaty ports, according to the "Returns of Trade at the Treaty Ports for the Year 1880," were as follows:

PORTS.	Chinese.	Foreign.
Canton.....	1,600,000	243
Tientsin.....	980,000	179
Foochow.....	630,000	239
Hankow.....	600,000	129
Shanghai.....	272,234	1,980
Ningpo.....	260,000	152
Takow and Fialwan.....	235,000	48
Chinkiang.....	180,000	69
Tamsui.....	90,000	39
Amoy.....	88,000	292
Wenchow.....	88,000	13
Newchwang.....	60,000	118
Kiukiang.....	48,000	45
Woofoo.....	40,000	17
Chefoo.....	35,000	262
Tchang.....	33,560	17
Swatow.....	30,000	127
Klungchow.....	30,000	10
Pakhoi.....	25,000	11
Total.....	5,219,794	8,995

The number of foreigners of each nationality in the treaty ports, and the number of business houses belonging to each, were as follows in 1879:

NATIONALITIES.	Business houses.	Population.
British.....	299	2,070
American.....	31	469
German.....	64	364
French.....	20	228
Spanish.....	1	153
Russian.....	16	79
Danish.....	5	78
Japanese.....	2	61
Austrian.....	..	35
Swedish and Norwegian.....	1	85
Dutch.....	2	28
Italian.....	1	17
Belgian.....	1	9
Other nationalities.....	9	874
Total.....	451	3,995

The possibility of a war with Russia has caused the Chinese Government to consider plans for the reorganization of the army, and it has actually begun the work of reform. According to the plan adopted, three armies are to be organized: 1. The Army of Mantchooria, comprising 30,000 men, and located between Mukden and Tsitsikhar, with its headquarters at Mukden. 2. The Army of Mongolia, 20,000 strong, which is intended to defend the roads

leading through Mongolia to the Russian frontier. It is stationed in the neighborhood of Kalgan, and is placed under the command of the military chief to whom is intrusted the defense of Peking. 3. The Army of Turkistan, numbering 40,000 men, which is intended to protect the western frontier. Besides these armies of operation, there is to be another army of about 100,000 men which is to occupy the border provinces, and still another of about the same strength for the defense of Peking, and the preservation of order in the interior. This would make a total of about 300,000 men, which in time of war could be increased to 1,000,000 men.

The Chinese fleet is composed of the three squadrons of Canton, Foochow, and Shanghai. According to a report of Captain A. Bocard, in

the "Revue Maritime et Coloniale," January, 1880, it contained the following vessels:

VESSELS.	Guns.	Men.
2 frigates	52	1,200
1 corvette	11	350
47 gunboats	207	4,000
2 steam-sloops	4	40
3 transports	6	270
1 steamer	8	...
56 vessels	283	5,560

Nothing definite is known about the revenues of the Government, which are estimated at 79,500,000 taels of Haikwau (1 Haikwau tael = \$1.40). The customs receipts in the treaty ports have been published since 1861. The amounts received have been as follows (in Haikwau taels):

YEAR.	Imports.	Exports.	Coasting trade.	Tonnage dues.	Transit.	Total.
Average for { 1866-1870...}	3,350,792	5,113,503	475,291	211,271	152,740	9,303,598
1875	3,904,499	6,931,984	645,961	236,694	249,031	11,968,109
1876	4,063,582	6,995,569	611,430	234,314	248,026	12,152,921
1877	4,175,075	6,843,763	570,221	224,035	258,955	12,067,073
1878	4,188,002	7,109,608	659,059	260,181	273,103	12,489,953
1879	4,542,524	7,855,070	719,447	247,533	342,796	13,531,670
1880	4,617,773	8,268,682	786,196	249,501	336,341	14,268,588

In 1874 the Chinese Government contracted the first foreign debt, amounting to 13,500,000 taels; of this amount 7,000,000 taels have been paid, leaving a debt of 6,500,000 taels. The home debt amounts to 30,000,000 taels.

The foreign commerce of China with the United States, Great Britain, Russia, and other countries of Europe, etc., during the years 1875-'81, was as given in the annexed table (values expressed in Haikwau taels).

YEARS.	Imports.	Exports.
1875	67,903,247	68,912,929
1876	70,269,574	80,850,512
1877	73,238,596	67,445,022
1878	70,504,027	67,172,179
1879	82,227,424	72,281,262
1880	79,298,452	77,883,587

The imports from and exports to the different countries in 1879 and 1880 were as follows (values expressed in Haikwau taels):

COUNTRIES.	1879.		1880.	
	Imports.	Exports.	Imports.	Exports.
Great Britain	20,833,000	26,125,000	21,881,000	27,824,000
Hong-Kong	29,641,000	16,403,000	30,253,000	16,609,000
East Indies	24,677,000	550,000	20,706,000	1,106,000
Straits Settlements and other British possessions	1,294,000	2,305,000	1,187,000	2,995,000
United States	2,541,000	8,967,000	1,205,000	9,107,000
Russia (Odessa)	12,000	29,000
Other countries of Europe	1,750,000	10,152,000	2,297,000	12,592,000
Russia and Siberia <i>via</i> Kiakhta	277,000	4,188,000	4,055,000
Japan	8,417,000	2,233,000	8,501,000	2,208,000
Other countries	866,000	846,000	609,000	1,064,000
Total	84,796,000	72,251,000	81,639,000	77,884,000
Re-exportation	2,569,000	2,346,000

The principal articles of import and export were as follows (in Haikwau taels):

ARTICLES.	IMPORTS (EXCLUSIVE OF RE-EXPORTS).		ARTICLES.	EXPORTS.	
	1879.	1880.		1879.	1880.
Opium	86,537,000	82,845,000	Black tea	27,521,000	29,299,000
Cotton goods	22,600,000	23,383,000	Green tea	4,309,000	4,196,000
Woolen goods	4,954,000	5,811,000	Brick-tea	1,393,000	2,182,000
Metals	4,132,000	4,079,000	Silk	28,620,000	29,581,000
Miscellaneous	14,004,000	13,675,000	Sugar	2,225,600	8,264,000
			Miscellaneous	8,218,000	9,162,000
Total	82,227,000	79,293,000	Total	72,281,000	77,884,000

The commerce of the treaty ports in 1880 was as follows (in Haikwan taels):

PORTS.	Imports.	Exports.
Newchwang	250,000	158,000
Tientsin	1,191,000	4,240,000
Chefoo	651,000	94,000
Hankow	25,000	7,644,000
Kinkiang	260,000
Chinkiang	8,000
Shanghai	56,046,000	36,179,000
Ningpo	73,000	10,000
Poochow	2,802,000	9,134,000
Tamsui (Formosa)	747,000	116,000
Takow	1,286,000	1,815,000
Amoy	5,412,000	3,638,000
Swatow	8,214,000	1,240,000
Canton	2,940,000	12,503,000
Kiunchow	825,000	833,100
Pakhoi	1,218,000	211,000
Total	81,639,000	77,884,000
Re-exports	2,346,000

The movement of shipping in the Chinese ports during the years 1879 and 1880 is shown by the following table (entrances and clearances being taken together):

FLAGS.	1879.		1880.	
	Vessels.	Tons.	Vessels.	Tons.
British	10,609	8,126,004	12,397	9,606,156
German	1,907	721,046	1,501	632,044
American	981	270,632	1,070	287,369
French	164	154,995	123	159,207
Japanese	157	133,205	201	167,902
Chinese	4,560	4,206,771	5,335	4,699,255
Others	2,781	309,565	2,333	331,419
Steamers	14,599	12,260,132	17,300	14,572,713
Sailing-vessels	6,900	1,667,059	5,670	1,301,634
Total	21,409	13,927,221	22,970	15,574,352

The first attempt to introduce railways was made by the construction of a short line from Shanghai to Woosung, forty miles in length. One half of this line, from Shanghai to Kangwang, was opened for traffic June 3, 1876, but closed again in 1877, after having been purchased by the Chinese authorities. There are four lines of electric telegraph, having an aggregate length of thirty-nine miles.

Tsze An, known as the Eastern Empress, one of the Empresses-dowager who were jointly clothed with the imperial authority during the minority of the Emperor, died in March. Her co-regent, Tsze Hi, lay dangerously ill for some time. Had her death followed, there would have supervened a political crisis, which might have resulted in a dynastic revolution. The selection of the present infant Emperor has constantly been held by many in authority to have been contrary to the constitutional precedents and religious principles of the empire. There are also serious irregularities in the present regency, to which the orderly minds of the Chinese are with difficulty reconciled. The regency should have been resigned by the Empresses-regent to the widow of the late Emperor; and it was imperatively incumbent upon the father of the present Emperor to keep him away from

court, and entirely remote from public affairs, because the natural authority of a father and the homage of a subject are, according to Chinese conceptions, absolutely incompatible.

The controversy with Russia regarding the restoration to China of the province of Ili, and its capital, Kulja, seemed likely in the summer of 1880 to result in a war, which would have proved most disastrous to China. The influence of the Marquis Tseng and of Colonel Gordon barely prevented the war party, headed by Prince Ch'un, the father of the Emperor, and by Tso-Tsung-t'ang, Governor-General of Eastern Turkistan, and reputed subjugator of Kashgaria, from plunging their country into the unequal conflict. The moderate progressist party, which exerted its influence in favor of peace, although it was led by the most eminent statesmen of China—Ch'un's brother, Prince Kung, and the great Viceroy, Li-Hung-chang—and had more moral weight among the mandarins, lacked the power and prestige which the support of the Empresses-regent gave their opponents. The warnings of Gordon and Tseng sustained the peace party, and prevented a collision after the rejection of the Treaty of Livadia. The Government remitted the sentence of Chung-how, the negotiator of the repudiated treaty, who had been condemned to death, and expressed its willingness to resume negotiations. Russia was reluctant to redeem her promise to retire from the occupied province whenever the Chinese Government was in a position to govern it, without some substantial recompense. The contingency of China's reasserting her sovereignty in Turkistan seemed remote at the time when Russian troops occupied Kulja. The Russian Government were apparently desirous that China, without having a cause which would appear reasonable to Europe, should be provoked into commencing hostilities. This would enable the Russians to seize upon a strip of the Korean coast, which would give the Muscovite Empire the coveted maritime foothold on the Pacific.

The failure of the Marquis Tseng to obtain satisfactory terms, which the folly of his predecessor and the indifference of Russia rendered extremely difficult, brought the martial clement again to the front in the winter of 1880-'81. If Russia had the intention of harrying China into a declaration of war, she defeated her purpose by her own active preparations for the encounter. For it was the dread of her naval power displayed on the sea-coast, and the appreciation of her superior military strength, which enabled peaceful counsels to prevail again at Peking.

Troops were sent forward toward the frontier. The fire-eating Tso, who had the credit of having reconquered the dominion of Yakob Beg, although he had actually contributed nothing toward the achievement, and who was one of the loudest denounciators of the Treaty of Livadia, was summoned to Peking to add his support to Prince Ch'un and the war party.

The Chinese troops in Central Asia were under the nominal command of Liu-Chang-yo, who had his headquarters at Kashgar, and had from 20,000 to 30,000 men in his own command. Besides these there were about 30,000 troops garrisoned in Soongaria, or engaged in maintaining the long lines of communication between Kashgar and Kansu, under command of Generals Kinshun and Liu-Chang-yo. There were large numbers of disbanded soldiers tilling the soil, to furnish supplies to the troops. The Government was concentrating troops at Shan-Hai-Kwan. The military efficiency of the troops which the Government in its ignorance was prepared to put against trained European soldiery was contemptible. They lacked the first elements of tactical training, and were armed for the most part with worthless matchlocks. The Russians with a few thousand men could have cut off the army of 60,000 troops in farther Kansu, and the new dominion from all communication with China, and would have had them entirely at their mercy.

General Gordon, who had been summoned by the Government to advise them in their difficulties, discovered that the Chinese had deceived themselves as to their boasted progress in the military art. The superficial acquirements of the most recent improvements of military science—torpedoes, gunboats, steam-transports, heavy artillery, modern fortifications, rifle-practice, etc.—only deluded them into the belief that they were on a par with European countries, when their military organization was really as defective and primitive as before. Gordon left with Li-Hung-chang, as he returned to Europe, a memorandum upon the military power of China, and the best mode of its development. He advises the retention of the old system of tactics and organization, as better suited to the character of the people. He warns the Chinese that they can not stand up before solid bodies of European soldiery, and advises them never to attempt pitched battles. They should cultivate skirmishing; and, with their facility in throwing up earth-works, and power of quick movement unhampered by pack and baggage, they might by their numbers, frugality, and hardihood, harass and wear out an enemy with whom they could never cope in regular warfare. Their naval defenses should consist of numerous and small armed craft, and plenty of small and cheap torpedoes. The army should be armed with breech-loading rifles, and should not attempt to handle heavy field-guns or be burdened with any equipments which would hinder its movements in the skirmishing tactics of irregular warfare on which it must rely. "China needs," he concluded, "no Europeans or foreigners to help her in carrying out this programme. If she can not carry out what is recommended herself, no one else can."

The moderation and election of a pacific policy on the part of Russia, no less than the influence of the wiser Chinese statesmen and

the tact of the Chinese plenipotentiary in St. Petersburg, brought the international difficulty to a peaceful issue. By the Treaty of St. Petersburg, Russia consented to restore nearly the whole of the territory in dispute, including the important Tekes Valley, which Chung-how had agreed to surrender, and the command of the passes of the Tien-shan. China agreed to pay to the Russian Government a large sum as an indemnity for the cost of pacifying and occupying the province. The other stipulations look toward the improvement of commercial relations and the extension of the overland commerce, and their effect is likely to be for some time to come simply a moral one. The abatement of the jealousy and enmity with which Russians are regarded by the Chinese may be effected by a conciliatory policy, and the knowledge of Russia's military strength might influence the Chinese Government without a breach of friendship; whereas a war would result in the overthrow of the dynasty, and leave no means of resisting the purposes of Russia which would be permitted by other powers, and would excite an animosity which would rankle for generations in the hearts of the people. A friendly Chinese Government may permit the Russians to establish themselves in the really independent Corea. But the project of commercial supremacy in Eastern Asia, which is the practical object of Russia in advancing eastward in the interior and in seeking to establish stations on the Pacific sea-board, would be defeated entirely by an embittered conflict with the Chinese people.

The fleet which Russia concentrated at Vladivostok at the critical stage of the Kulja negotiations was the most powerful ever sent to the Eastern seas. Had hostilities broken out, the two northern provinces of Corea would probably have been occupied by the Russians, giving them a position on the Yellow Sea which would always be within easy striking distance of the capital and northern ports of China, besides the much-desired harbor of Yung Hing, better known under the Russian name of Port Lazareff. The harbor of Port Lazareff on the Sea of Japan is one of the finest in the world, being perfectly sheltered and containing anchoring-ground for any number of vessels of the deepest draught. It lies only about one hundred miles south of the Tumen River, which divides Corea from Russian Tartary. Russian statesmen have desired for generations to secure a harbor which should be open all the year round on the Pacific, and have already been disappointed in two which have been tried. This port, which lies at their door, and can be annexed at any time without a blow and with small risk of serious complications, answers perfectly the commercial and strategic requirements.

The Treaty of St. Petersburg, by which the retrocession of Kulja to China was accorded, secured to Russia in return extended commercial privileges in China. The development of

an active overland trade with the Chinese Empire is the only peaceable object which would yield adequate returns for the Russian operations in Central Asia. The monopoly of the Chinese trade has been one of the traditional aims of the Russian Government. The new treaty opens another free passage through the Great Wall besides Kalgan, which has been the terminus of the Russian caravans for two hundred years. The new entrance at Souchow, near the western end of the Great Wall, will not probably transfer the business of the old route to that town, but will open up a new trade of uncertain value. The Russians will not be allowed to conduct their caravans beyond Souchow, but will have consular representatives in that place, in Turfan, and at other points. The country which is commercially tributary to the new route is not, however, one of very rich resources. Souchow lies west of the province of Kansu and within trading distance of Kulja, Kashgaria, and the neighboring states. The portion of the province of Ili which was retained by Russia is a tract which had been colonized by Russian subjects. It extends from the post Boro-Kudzir to the river Kargos, being the northwest abutting corner of the Kulja district. The indemnity payable by China is ten million rubles. The common frontier between the Chinese and Russian dominions, extending from Kashgaria in the west to the river Tumen-Dham in the east, has a length of nearly five thousand miles.

The difficulties experienced in transporting troops and preparing for the Russian invasion which seemed imminent during certain stages of the Kulja controversy, have had the effect of arousing the practical administrators in China to the necessity of disregarding the prejudices of the court and the academy against railroads and telegraphs, and of providing their country with the defensive advantages of modern means of transport and communication. Apart from the conservative opposition to barbarian innovations, there have been physical difficulties in the way of the utilization of the telegraph by the Chinese, owing to the complexity of their alphabet. This difficulty would be removed by the adoption of the autographic system, or still better by the employment of the telephone, the improvements in which instrument are watched with great interest in China. The Government has authorized Li-Hung-chang to construct a telegraph from Peking to Tientsin and Shanghai. The Government has also taken into consideration a project, approved by the principal officers of the army, to build a railroad from the capital to the port of Tientsin, seventy miles distant, and thence to the Yangtse River, five hundred miles farther south. The latter section, if the plan is adopted, can not probably be undertaken soon in the present state of the imperial finances, at least not until the Russian indemnity is cleared off.

Two additional gunboats were completed for

the Chinese navy by Armstrong in the summer. Like the nine which had before been furnished, they are of diminutive size, and are entirely unarmored; but, unlike the rest of the fleet, they carry large guns of a penetrative power only equaled by those of the huge new English and Italian ironclads. They are fleetier than any armored craft; are so small that they can not be easily hit, and if hit are not likely to be disabled, as their vulnerable parts are under water.

The clearing out of the obstructed waterways of the metropolitan province has been undertaken at the instigation of Tso-Tsung-t'ang, who proposes to employ several thousand veteran soldiers on the work. Prince Ch'un and Li-Hung-chang supported their political opponent in this costly but necessary improvement. The net-work of rivers which intersect this part of China flow through the vast alluvial plain with a current so sluggish that they become filled with silt if they are not periodically dredged out. Neglect to do this for many years past has occasioned frequent and destructive inundations.

The Chinese Government seem to have grown more earnest in their efforts to suppress the opium-vice. In England a growing popular sentiment demands the stoppage of the Indian supplies of the drug. A smaller proportion of the opium consumed in China comes from India than has been commonly supposed. In Western China, where the habit is almost universal and is indulged in openly, the entire supply is locally produced, and in the eastern provinces the lower classes use the coarser Chinese product. In Eastern Sze-Chuen, Kwei-Chow, and Southwestern Hu-Pei, and other parts of the west, there is an enormous production, larger considerably than is reported to the Government. The province of Yunnan has been restored to cultivation, the leading crop being a winter growth of poppies. A large contraband trade is carried on with the eastern provinces. In Eastern China also there are opium districts on the border-land of Chihli, Ho-Nan, Shantung, and Kiang-Su. The crop is seven times as remunerative as grain, but is less sure. In famine years the officials sometimes destroy the poppy-crops according to law, but at other times there is usually no interference with the culture. In the treaty recently concluded with Russia, as in the commercial treaty with the United States, the Chinese Government inserted a clause prohibiting the importation of opium. These provisions indicate an intention to reopen the subject of the Indian imports of opium, either with the design of stamping out the vice, or of preventing India from draining from China through the opium monopoly sums huge enough in the aggregate to pay a large proportion of the enormous expenses of her government. The reports of the trade for 1879 show that the imports were larger than in any previous year, and about 15 per cent in excess of those of the preceding year, being

82,927 piculs in all (1 picul=133½ lbs.). There were 2,300 piculs of Persian opium, which has been much used of late years to mix with the other sorts. The rest of the importation was exclusively of Indian production. The domestic product, whether the culture is forbidden, connived in, or encouraged by the local authorities, is equal to the total imports several times multiplied, and acquires larger proportions annually. The Treaty of Tientsin fixed the maximum tariff which the Chinese Government might impose upon Indian opium. China has persistently endeavored to obtain the rescission of this clause. The income derived by the Indian Government from the monopoly of the opium manufacture has increased meanwhile from £4,000,000 to £9,000,000, and the cultivation of opium in India is still spreading. Financial considerations, supported by the usages of international law, would explain and justify China's attitude in demanding the removal of the restriction upon her right to regulate her own tariff. There are evidences, however, of sincerity in the present efforts of the Chinese authorities to discourage and gradually exterminate the pernicious habit of opium-smoking. The Indian traffic might properly engage their attention pre-eminently on account of the spread of the vice among the respectable classes, who use the Indian-grown article only. The number of persons in China who suffer from the opium-habit is estimated by the inspector-general of customs, Mr. Hart, at not over 2,000,000, or $\frac{1}{3}$ of one per cent of the total population. The Secretary of State of China recently addressed a letter to the British Government, in which he described the pernicious effects of the traffic. There are indications that when the demand to rescind the oppressive clause in the treaty with Great Britain is urged, the power of public opinion in England will compel its abrogation, notwithstanding the grave problem in the finances of India, from one sixth to one third of whose revenues are drawn from this ignoble traffic.

The total foreign commerce of China in 1880, as returned at the treaty ports, was 157,000,000 taels, a larger amount than ever before reached. The share of the British Empire amounted to at least 120,000,000 taels, and that of Great Britain alone to 49,000,000. The proportion of the carrying trade conducted in British ships is as great, 73 per cent of the exports and imports being carried in British bottoms. The coastwise trade, 40 per cent of which was once done by American vessels, is now equally divided between native and British craft. The extraordinary quantities of American cottons brought into China in 1878 and 1879, which caused a tremor in British commercial circles, ceased to be exported as soon as better prices ruled in the United States. The high average prices obtainable in the domestic market seem to deter the American manufacturers from extending their facilities and entering into serious competition with the

British cotton-millers for this important trade which the high reputation of their goods places within their grasp. The import of American drillings fell off from 633,000 pieces in 1879 to 172,000 pieces in 1880, while British drills rose from 387,000 pieces in 1879 to 628,000 pieces in 1880. American sheetings continue in demand at prices which tempt American exporters; but they are being imitated and undersold by an inferior Lancashire fabric. The warning given by the marked preference of the consumers for unadulterated goods in the years of American competition has been heeded in England. There was a much smaller proportion of heavily sized goods imported into China in 1880 than in previous years. The importation of the Manchester staples, gray shirtings and T-cloths, in which there has never been any competition, increased from 3,130,000 pieces in 1865 to 7,519,000 pieces in 1875, and 8,260,000 pieces in 1880, while the prices have fallen.

CHLOROPHYL, PHYSIOLOGICAL FUNCTION
OR. The conversion of the carbonic acid of the atmosphere into living protoplasm in the green organs of plants may be considered the starting-point of animate nature. The first living organisms which appeared upon the planet must have been chlorophyll-containing plants. All the phenomena of life are consequent and dependent upon the constructive operations by which the primary gases and their simple compounds are transformed into highly complex substances within the bodies of plants, chief of which is the formation of hydrocarbons by the leaves. Animals, and the few plants which are without chlorophyll, only subsist by the destruction and resolution into their lifeless elements of the substances thus built up by green plants. The nature of this primary and fundamental process in the chemistry of life is a mystery. The green coloring matter of the leaves has seemed to be the chief agent in vegetable alimentation, and its action seems to be excited by the sunlight. The results of the German botanist Pringsheim, who has devoted several years to an investigation of the office of chlorophyll, even if his theoretical deductions are not conclusive in all points, throw a new light upon the properties and action of chlorophyll and substantially forward the solution of the greatest problem of organic chemistry.

Careful observations of the optical properties of chlorophyll confirmed the findings of previous investigators. Chlorophyll solutions of various degrees of density were found by spectroscopic analysis to absorb the blue and violet rays in a much greater measure than the red, yellow, and green. The structure of the chlorophyll corpuscles has been established for the first time by Pringsheim. They consist of a honey-combed spherule of some solid substance, probably an albuminoid, whose cavities are filled with an oil containing the chlorophyll in solution. In the chlorophyll corpus-

cles he has found a new substance, to which he gives the name of *hypoehlorin*. When chlorophyll-cells are placed for twenty-four hours in dilute hydrochloric acid, and then washed with water and laid in glycerine, in a short time brownish drops are seen to ooze out of the chlorophyll-granules. These consist of hypoehlorin, which has been drawn out of the interior of the granule, probably by the mechanical action of the acid. After a space of time, long spiral needles, which seem to be imperfect crystals, form from the drops of hypoehlorin. No hypoehlorin is obtained from chlorophyll tissue which has been strongly heated. Wiesner found that chlorophyll is destroyed by intense sunlight. Pringsheim has shown that excessive sunshine destroys not only hypoehlorin as well, but breaks down other constituents of the living plant-cell. The destruction of these substances, he found, by subjecting the parts of plants to concentrated sunlight, and interposing different coloring matters, takes place in the cold blue rays as well as in the warm red rays—much faster, indeed, in blue light. The decomposition was clearly due to a peculiar action of light, and not to the heating effect of the sun's rays. Further experiments showed that it only took place in the presence of free atmospheric oxygen. It was therefore a process of oxidation excited by light. It was known that the process of oxidation, analogous to the breathing of animals, took place in plant-cells, not only in the dark, but in the light as well; though it was believed to be more rapid in the dark. Pringsheim's observations prove that light greatly accelerates the process. Light seems, then, to perform two distinct and opposite parts in vegetation, one in the reduction of carbonic acid to substances poor in oxygen and highly combustible, the other in the combustion of certain of these assimilated materials. If the assimilation did not proceed more actively than the process of oxidation, plant-life would be impossible. The function of chlorophyll seems to be, then, to act as a shield or screen to prevent excessive oxidation, protecting the combustible products of assimilation from the action of light, which appears to excite and intensify the oxidation.

The first step in the nutritive process of plants, the primary assimilation product formed from inorganic matter, is an interesting subject of speculation. The laws of arithmetical proportion, which govern the combination of analogous organic compounds, have led to the prediction of numerous substances before they had been obtained in a separate state. The theory of Baeyer, that formic aldehyde, CH_2O , is the primary assimilation product, which forms the basis of the various hydrocarbons, is, therefore, not without justification. Pringsheim advances the hypothesis that hypoehlorin is the product of the assimilative process. It will probably be obtained separate from other bodies and in quantities admitting

of analysis, and then its claim as the product of assimilation can be better considered. Pringsheim's supposition that it is a compound poor in oxygen is rendered likely by its ready combustion under the influence of focalized sunlight. Its generation in the chlorophyll-granules, and the little that is known of its chemical behavior, are indications in favor of its being the radical developed by the assimilative process, if there be but one, which, by a more moderate oxidation in the living cells, passes over into the hydrocarbons, oils, and other organic compounds. It is always associated with chlorophyll. In the seedlings of angiospermous plants which have been kept in the dark, neither chlorophyll nor hypoehlorin are found. After they have been exposed to light awhile, they begin to turn green, and not till then do they show any traces of hypoehlorin. A remarkable exception to the general rule is presented by seedlings of the conifers, since these produce both chlorophyll and hypoehlorin, though kept in a place where no light has access.

CLAYTON-BULWER TREATY. (See PANAMA CANAL.)

CLIFFORD, NATHAN, born at Rumney, New Hampshire, August 18, 1803; died at Cornish, Maine, July 25, 1881. In the Haverhill Academy he received a common-school education, and afterward graduated at the Hampton Literary Institution, being indebted to his own exertions for this advantage. He studied law, was admitted to the bar, and commenced the practice of his profession in York County, Maine, 1827. In 1830 he was elected to the State Legislature as Representative from the town of Newfield, as a member of the Democratic party, of which he was considered one of the ablest leaders. He served until 1834, having been elected Speaker of the House in 1833. By Governor Dunlap Mr. Clifford was appointed Attorney-General of the State of Maine, which office he filled with distinguished ability. In 1838 he was nominated for Congress as a Representative from York district in place of Mr. John Fairfield, who was then the Democratic candidate for Governor. After an excited contest, he was elected by a large majority over Mr. Nathan D. Appleton, Whig. In 1840 he took the field as an advocate of Mr. Van Buren's re-election, and met in public discussions some of the most distinguished Whig orators, being recognized as one of the eloquent champions of the Democracy. He was re-elected to the Twenty-seventh Congress, receiving nine hundred majority of votes over Daniel Goodenow, Whig.

On Mr. Polk's accession to the presidency, Mr. Clifford was appointed Attorney-General of the United States. In this high position he acquitted himself in a manner which received the commendations of the bar and of the Supreme Court. As a member of Mr. Polk's Cabinet his talents were acknowledged by his party, and, when the Mexican War was draw-

ing to a close, and the complications of General Scott, Mr. Trist, and Governor Marcy threatened the success of much that had been won by our arms, Mr. Clifford was sent to Mexico with full powers to conclude a treaty. Superseding all the functionaries as commissioner of the United States, he arranged the treaty of peace by which California became an integral portion of the United States. After bringing about this important piece of diplomacy, and having ratified the treaty with the reorganized Mexican Republic, he received the appointment of minister to Mexico as a testimonial for his valuable services. He remained there long enough to cement the new peace, and to secure the cordial and complete execution of the articles of the treaty, when he resigned, and went back to the practice of his profession in Portland, Maine. Although he did not again appear as a candidate for office during seven years, he found time to advocate the principles of Democracy and State Rights on all important occasions. At the bar of Maine he won an enviable reputation for forensic skill, and commanded a large and lucrative practice. In January, 1858, President Buchanan appointed him Associate Justice of the Supreme Court of the United States, and the intelligence of his elevation to this dignity was received with general satisfaction throughout the country, especially in Maine. He had been the first member of the Cabinet taken from that State, and the only representative she ever had in the Supreme Court.

The many years of his service on the bench were marked by a stern devotion to duty, as well as by integrity and capacity, and his appointment to the presidency of the famous Electoral Commission was everywhere regarded as most appropriate. He was a firm believer in Tilden's title, and his position made it necessary for him to sign the decisions of the commission. The preparation of the papers in the Florida case fell to Senator Hoar, on account of Senator Edmunds's illness, and their completion was delayed until within a few minutes of noon of the 4th of March. By insisting upon a rigid personal scrutiny of the papers Judge Clifford could have put off their execution until too late for the inauguration of Mr. Hayes. He did not, however, throw the smallest obstacle in the way of the work, but showed almost equal anxiety with Mr. Hoar in hurrying it forward, and promptly affixed his signature as soon as the documents were completed. During the administration of Mr. Hayes, however, he never went to the White House. In October, 1880, he was attacked with a serious illness, which was so severe that it not only incapacitated him from work, but affected his reason; despite a robust and hardy constitution, a complication of disorders arose, gangrene supervened, and it was found necessary to amputate one of his feet. From this illness he never recovered, and in his death the country has lost a man distin-

guished for diplomatic and legal talents of a high order.

CLINTON, J. J., died May 25, 1881, at Atlantic City, New Jersey. He was the senior bishop of the conference of the African Zion Methodist Episcopal Church. Bishop Clinton was born about the year 1820, and enjoyed school advantages which were at that time denied to most of his race, and, although not a graduate of any university, he received an excellent academic education, and by his unusual natural abilities soon rose into prominence. He commenced his ministerial labors as an accredited preacher in Philadelphia in 1839, and as local preacher in 1840, entering the itinerant sphere in 1841. He was ordained deacon in 1844, elder in 1846, and was elected and consecrated to the episcopal office in May, 1864. As a worker for the African Zion Connection, he was among the first, and during the forty years of his labors traveled through almost every State in the Union. He was Missionary Bishop to the South during and subsequent to the war, and accomplished remarkable results in establishing missions and annual conferences which were the life of the colored Methodist Church in the South. As a contributor to the press he was forcible, eloquent as a public speaker, and in his preaching wonderfully effective. Possessed of rare executive ability, it was conceded by both white and colored people that as an episcopal officer he had few superiors. His death resulted from paralysis, and memorial services were held by all the churches of the conferences in his honor.

COLOMBIA (REPÚBLICA DE COLOMBIA). For statistics relating to area, territorial division, population, etc., see "Annual Cyclopædia" for 1877. Concerning the boundary question with Costa Rica, an extract of resolutions, passed in the Colombian Congress in 1880, was given in our volume for that year. It has been stated that toward the close of 1881 undoubted information had been received at Washington of a treaty said to have been signed between the two republics, intended for the purpose of securing European arbitration in the disputed question of isthmian territory. By the terms of the treaty, several arbitrators were proposed: First, the King of the Belgians; next, in case of that monarch's refusal, the King of Spain; and, finally, should the latter too decline, the President of the Argentine Republic. Neither of the disputants had made official communication of the treaty to the United States Government. It was hoped that the proposed arbitrators would refuse to act; for, if they accepted the offer, the Washington Government would, in the opinion of the author of the report, protest—"the United States claiming the rights of a virtual protectorate over the States upon the Isthmus of Panama as far as to the northern boundaries of the province of Chiriquí, and not disposed to relinquish that quasi-suzerainty, whatever the decision of a European arbitrator might be. It

is understood that M. de Lesseps is the author of the arbitration scheme, with a view to concentrate upon the Isthmus a European influence as against the United States, whose government is antagonistic to the Panama Canal."

The President of Colombia was General Rafael Nuñez (from April 1, 1880, to March 31, 1882); and the Cabinet was composed of the following ministers: Foreign Affairs and Public Instruction, Señor R. Becerra (*ad interim*); Interior, Señor C. Calderon; Finance, Señor S. de Herrera; Commerce, Señor A. Roldan; Public Works, Post-Office, etc., Señor Gregorio Obregon; War and Marine, General Eliseo Payan.

The chief magistrates of the nine States were as follows:

Antioquia	Señor P. Restrepo.
Bolívar	" B. Noguera.
Boyacá	" J. E. Otalora.
Cauca	" G. E. Hurtado.
Cundinamarca	" W. Ibañez.
Magdalena	" N. Campo-Serrano.
Panama	" D. Cervera.
Santander	" S. Wilches.
Tolima	" J. Santos.

Each of the foregoing functionaries has the title of president, except those of Cundinamarca and Tolima, who are styled governors.

The Colombian Minister Plenipotentiary to the United States is General R. S. D. Vila; and the Colombian Consul-General at New York is Señor Luis de Pombo.

The United States Minister Plenipotentiary to Colombia is General Manney (accredited in 1881); and the United States consuls at Bogotá and the chief Colombian seaports respectively were as follows: Bogotá, Mr. B. Koppel; Panama, Mr. John M. Wilson; Aspinwall, Mr. James Thorington; Cartagena, Mr. Edmund W. P. Smith; Sabanilla and Barranquilla, Mr. E. P. Pellet; Rio Hacha, Mr. N. Davies (vice-consul).

The regulation strength of the army in time of peace is 3,000, and in time of war each of the nine States is required to furnish a contingent of one per cent of its population. The total number of officers in the Guardia Colombiana was officially given at 1,927 in 1880.

The revenue and expenditure of the republic for the fiscal year 1879-'80 were officially reported at \$5,651,905 and \$5,773,575, thus showing a deficit of \$121,670. In the budget for the same year, the revenue and expenditure were estimated at \$4,910,000 and \$8,634,571; while in the President's message to Congress, on February 1, 1880, the revenue was set down at \$10,469,291.07½, and the expenditure at \$9,926,013.52½; but in these last figures must have been included items of expenditure extraordinary and loans to cover deficits.

"Owing to the peace which has been maintained, and which still reigns throughout the country," observes a Colombian newspaper correspondent, "a considerable rise is noticeable in national stocks. The custom-house department, for example, will produce in this financial year (1881-'82) from \$4,250,000 to

\$4,500,000; and it is anticipated that the necessary and increasing development of our industry and commerce will swell this return within two years to at least \$6,000,000."

The national debt was reported as follows, on August 31, 1880:

Foreign debt	\$9,957,000
Home "	7,526,189
Total	\$17,483,189

The subjoined communication on the subject of the debt was published in London, in 1881:

SIR: The bondholders of the United States of Colombia may congratulate themselves upon the era of prosperity now dawning on that country. Colombia, favored by nature and the world's commerce, is destined to become, *via* the Panama Canal, the connecting link between the Atlantic and Pacific Oceans, and the medium of the commerce of two hemispheres. The Colombian Government, recognizing the important position thus assigned to it, has decided to re-establish its credit by recognizing at once its obligations to its foreign creditors, and has, by a circular, dated March 3, 1881, agreed hereafter to pay all coupons on its foreign debt as they fall due, and will pay immediately the coupon due October 31, 1879, in arrear, and also fund six quarterly coupons in arrear, giving bonds bearing 5 per cent interest. The secretary of the Foreign Bondholders' Committee has called a meeting for the 17th instant, to enable the bondholders to accept and ratify the above arrangement. The position of each bondholder will then be as follows: each holder of £100 stock will receive interest quarterly, on and from July 1st next, at the rate of 4½ per cent per annum, hereafter to be increased to 5 per cent, and will receive in addition one coupon in arrear in cash, and six coupons in arrear in stock, making the nominal value of his holding £111 6s. 3d. for each £100, bearing interest at the rate of 4½ and 5 per cent, the present price of which is 45. Colombia, with such a future before her, necessitating her borrowing in the money markets of the world for the construction of railroads and other public works, has the strongest incentives to maintain her credit. Hence her creditors may be of good cheer.

March 10, 1881.

In September of the same year, however, the Council of Foreign Bondholders communicated that they had received authentic information from Bogotá, under date July 6th, that the Colombian Congress had closed without any steps having been taken to secure the ratification of the convention of the 3d of March, 1881, with the bondholders. The resumption of payment was consequently indefinitely postponed.

The foreign trade of the republic, in the year 1879-'80, was of the total value of \$24,391,984 (of which \$13,804,981 was for exports), against \$24,499,165 (of which \$13,711,511 stood for exports).

The chief export staples are gold, silver, Peruvian bark, coffee, skins, tobacco, Panama hats, India-rubber, and cotton.

The trade carried on through the port of Panama is of two kinds, local and transit. Of the former, we shall here mention only that with the United States, whither the exports for the year ending December 31, 1879, were of the classes and values exhibited in the annexed tabular statement:

COMMODITIES.	First quarter.	Second quarter.	Third quarter.	Fourth quarter.	Totals.
Antiquities.....	\$45 00	\$100 00	\$145 00
Balsam.....	\$69 70	69 70
Cigars.....	2,160 00	2,160 00
Cacao.....	544 00	8,815 80	\$480 82	5,098 62
Coffee.....	86 75	6,977 50	2,043 80	1,876 90	10,434 45

Skins.....	669 90	516 00	2,339 60	8,525 50
Vanilla.....	96 80	3,147 80	8,244 60
Wood.....	4,014 27	2,885 30	1,206 40	7,605 97
Whale-oil.....	18 00	18 00
Totals.....	\$111,897 22	\$76,070 70	\$114,008 00	\$187,611 68	\$489,087 60

The value of the imports from the United States it is impossible to determine with precision, Panama being a free port of entry, and no official record being kept of imports thereto; but Consul Wilson estimates that value at \$450,000 for the year mentioned. The commodities received from the United States are chiefly canned goods, fruits, jellies, corn, beef, beans, etc.; bacon, hams, lard, butter, breadstuffs; prints and other cotton fabrics. Since 1878 the trade in American dry goods appears to have greatly increased, from one half to two thirds of the entire quantity imported being of American manufacture, while formerly the supply was almost exclusively from Europe (Great Britain, France, and Germany). Panama merchants attribute this change to the present superiority of quality and style of the United States products, together with their comparative cheapness, but more particularly to the quality and style, since they find our fabrics to be preferred to all others, even at equality of prices.

As all merchandise *in transitu* is carried over the Panama Railway, an idea of the extent of the trade may be formed from the total tonnage of that line for the years 1876-79, as shown by the following schedule:

MONTHS.	1876.	1877.	1878.	1879.
January.....	12,165 4	7,508 7	14,201 3	11,761 3
February.....	8,915 3	10,162 2	12,621 3	12,954 3
March.....	14,404 3	13,170 2	10,765 7	14,558 2
April.....	9,566 7	18,451 1	14,746 7	18,957 1
May.....	11,885 7	16,095 5	14,571 3	14,726 1
June.....	9,671 1	11,291 2	12,245 3	14,908 3
July.....	8,778 7	12,043 2	11,914 3	12,869 7
August.....	7,305 3	11,623 2	11,177 3	12,879 3
September.....	8,718 3	13,746 3	11,079 2	12,214 3
October.....	7,766 1	12,047 2	13,978 7	18,385 7
November.....	6,918 3	12,302 3	12,074 3	12,806 3
December.....	8,092 3	13,500	18,100 1	12,450 3
Totals.....	113,781 3	146,942 3	152,477 3	161,743 3

Here follows a table exhibiting the quantities of the principal commodities received *in transitu* at Panama from Central and South America and transported by the Panama Railway in 1877, 1878, and 1879:

COMMODITIES.	1877.	1878.	1879.
Bark.....bales..	20,169	40,500	39,653
Cotton.....bales..	4,775	13,576	40,026
Cacao.....bags..	115,019	59,466	186,110
Coffee.....bags..	238,181	191,561	351,070
Indigo.....zeroons..	11,584	7,438	9,531
Ivory-nuts.....bales..	56,987	184,596	59,795
Rubber.....bales..	16,516	16,360	16,711
Sugar.....bags..	22,956	18,011	12,348

The quantities and destination of the coffee received at Panama from Central America (principally Guatemala and Costa Rica) in the first four months of 1879, were as follows:

DESTINATION.	Sacks.
Panama.....	8,047
South Pacific ports.....	5,094
Aspinwall.....	57
Europe (by British steamers).....	106,316
Europe (by German steamers).....	44,122
Europe (by French steamers).....	36,400
United States (by American and British steamers).....	24,706

Total..... 219,742

The port of Aspinwall, with a population of some 3,000, imports now from the United States almost everything it requires of foreign production, except liquors and cigars. Heretofore, scarcely anything went from us save cotton fabrics, and these under guise of a British brand! The value of the imports from the United States, in 1879, was estimated at \$800,000.

The exports to the United States from Aspinwall, in 1879, were as follows:

COMMODITIES.	Values.
Bananas.....	\$152,551 35
Cocoa-nuts.....	13,177 99
Hides.....	1,392 27
Ivory-nuts.....	124,450 43
Rubber.....	55,513 85
Tortoise-shell.....	5,510 00
Wood.....	773 72
Old rope.....	1,513 60
Sundries.....	86,614 14

Total..... \$391,511 40

Cartagena, the finest and the only natural harbor in Colombia, has, besides its own local trade, that of the Sinu and Atrato Rivers, for which it is the port of entry, and the prospect of controlling before long much of the commerce now carried on through Barranquilla. This diversion will be effected by means of a canal which,

tapping the Magdalena at Calamar, connects that river with the harbor of Cartagena, and which, reopened to navigation by the national and State governments, was under repairs as early as 1879, by an American engineer, and already navigable by craft of five feet draught. The cotton fabrics are almost exclusively from Great Britain and Germany: those from Manchester alone, in 1878, were of the value of \$100,000.* United States products are little in demand, and the few articles received are regarded as inferior to similar commodities from Europe. French butter, for instance, brings \$1 per pound; American, but 60 cents. The imports and exports at Cartagena for the year ending August 31, 1879, were as below:

IMPORTS.

SOURCES.	Number of packages.	Quantities (pounds).	Values.
United States.....	38,194	2,106,688	\$210,053
Germany.....	12,772	576,510	70,901
England.....	17,507	1,813,106	290,542
France.....	7,148	479,864	99,182
Cuba.....	552	93,130	13,433
Curacao.....	259	45,622	4,559
Italy.....	16,560	401,164	8,053
Venezuela.....	1	41	100
Aspinwall.....	2,425	141,938	40,731
Totals.....	95,418	5,159,060	\$737,559

EXPORTS.

DESTINATION.	Number of packages.	Quantities (pounds).	Values.
United States.....	384,800	3,279,688	\$157,920
Germany.....	24,645	2,341,572	230,736
England.....	4,007	3,604,686	167,980
France.....	1,417	101,400	4,264
Cuba.....	1,549	427,090	37,434
Curacao.....	8,084	16,036	785
Italy.....	3,850	248,400	7,476
Aspinwall.....	10,638	150,353	7,543

Totals.....	460,256	12,920,870	\$631,537

Through the port of Sabanilla the trade with the United States is steadily increasing. The value of the exports to the latter in 1879 was \$2,464,668, against \$2,071,131 in the year immediately preceding, as follows:

COMMODITIES.	Quantities.	Values.
Bark..... bales..	30,893	\$1,141,746 60
Coffee..... bags..	34,293	769,555 07
Hides..... loose..	113,353	448,396 38
Tobacco..... bales..	2,085	42,191 40
Tobacco..... bales..	5,103
Balsam..... boxes..	743	25,281 95
Rustic..... tons..	1,419	20,455 40
Rubber..... bales..	203	2,547 00
Plants..... boxes..	29	682 00
Skins..... bales..	49	2,093 90
Cigars..... boxes..	1	20 00
Mineral..... bags..	1	50 00
Ivory-nuts..... bags..	634	6,534 30
Dividivi..... bags..	157	360 00

Cedar..... logs..	1,371	1,392 00
Cacao..... boxes..	57	2,400 50
Various..... packages..	90	9,733 46
Total.....	\$2,464,667 90

* A single Manchester firm, it has been said, sent to Medellin in Colombia, prints of the value of \$750,000 in the same year.

† Shipped *via* New York for Europe without invoice.

From examination of the foregoing statistics the general impression derived would be that the trade between Colombia and the United States is less than that between Colombia and Europe. But there are figures to demonstrate that such is in reality not the case. For example, let France and Great Britain be taken as points of comparison, and we find the following elements:

Colombia imported from Great Britain in 1878....	\$5,098,000
“ “ “ France* in 1878.....	5,104,000
“ “ “ the United States in 1879	5,585,000
Total.....	\$15,787,000
Colombia exported to Great Britain in 1878.....	\$4,534,000
“ “ “ France* in 1878.....	2,592,000
“ “ “ the United States in 1879..	7,157,000
Total.....	\$14,313,000

Thus our exports to Colombia were, though slightly, in advance of those of either of the other two countries; but we imported from her more than both of the others together.

The chief imports by Colombia from all three countries last mentioned were as follows:

COMMODITIES.	France.	Great Britain.	United States.
Cotton fabrics.....	\$601,000	\$3,606,000	\$664,000
Linen fabrics.....	92,000	382,000
Woolen fabrics.....	774,000	222,000	14,000
Wearing apparel.....	753,000	162,000	76,000
Hardware and cutlery.....	90,000	11,200
Iron, wrought and unwrought.....	47,000	69,000	45,000
Leather and manufactures of.....	1,026,000	50,000	82,658
Arms, ammunition, etc.....	43,000	466,000
Earthen, china, and glass ware.....	64,000	35,000	52,000
Machinery, etc.....	23,000	239,000
Sundries.....	1,747,000	416,000	3,885,117
Totals.....	\$5,104,000	\$5,098,000	\$5,585,000

Four lines of steamers make Panama their terminal port, namely: 1. The line from Panama to San Francisco; 2. That from Panama to Central America and Mexico; 3. From Panama to the South Pacific as far as Valparaiso; 4. From Panama to Guayaquil. The two first-mentioned lines are owned and managed by the Pacific Mail Steamship Company, of New York; the two latter by the Pacific Steam Navigation Company, of Liverpool, England. The line from Panama to San Francisco runs two and, during the coffee season, three steamers a month each way, calling at Punta Arenas, Costa Rica; La Libertad, Salvador; San José, Guatemala; Acapulco, Manzanillo, San Blas, and Mazatlan, Mexico. The Central American and Mexican line runs three steamers per month, each way, calling at Punta Arenas, San Juan del Sur, Corinto, Amapala, La Union, La Libertad, San José, Champerico, Port Angle, and Acapulco. The line from Panama to the South Pacific runs weekly each way from Panama to Callao, calling at the

* About \$1,000,000 of the imports from France were from other countries and in transit through France; and perhaps a like proportion of the exports to France were likewise for other countries.

ports of Buenaventura, Tumaco, Guayaquil, Payta, connecting at Callao with their line to Valparaiso, and calling at eighteen different ports along the coast. The line from Panama to Guayaquil runs one steamer per month, each way, calling at Ballenita, Manta Bahía, Esmeraldas, Tumaco, Buenaventura.

The port of Aspinwall is visited by steamers making seventeen regular monthly arrivals and as many departures, as follows:

1. The Royal Mail Steam Packet Company, from Southampton; nine steamers; four arrivals per month.

2. The West India and Pacific Steamship Company, from Liverpool; twelve steamers; two arrivals per month.

3. The Compagnie Générale Transatlantique, from St. Nazaire and Havre; three steamers per month.

4. Hamburg American Line, from Hamburg; seven steamers; two arrivals per month.

5. Harrison Line, from Liverpool; sixteen steamers; one arrival per month.

6. Atlas Steamship Company, from New York; two arrivals per month.

7. Pacific Mail Steamship Company (American); three steamers per month from New York.

Of the seven lines but one is American.

The shipping movements at the port of Cartagena for the year ending August 31, 1879, were as follows:

REMARKS.	STEAMERS.		SAILING VESSELS.		TOTAL.	
	No.	Tons.	No.	Tons.	No.	Tons.
Entered.....	101	148,667	55	5,006	156	153,673
Cleared	101	148,667	54	5,006	155	153,673

The number of passengers carried by the Panama Railway in 1876 was 22,940; in 1877, 22,110; in 1878, 24,921; and in 1879, 23,729.

There were, in 1880, 1,850 miles of telegraph in the republic, the number of dispatches having been 150,204. The post-office returns for 1879-'80 were as follows: Letters, 463,832; printed matter, 413,350 packets.

In the department of public instruction the spirit of reform persists with its characteristic energy. An industrial feature has of late been imparted to the educational system, for the development of knowledge in the direction of technical professions; and the conversion of all the higher schools into schools of mines, commerce, and agriculture is seriously talked of in the right places.

The construction of the four national railways is being assiduously carried on, writes a native journalist. The Honda and Girardot lines are far advanced. The Honda section avoids the falls of Magdalena River, and will be the first whose valuable services will be available. The link line which has been run along the east bank of the Magdalena is now completed, and is already rendering important aid as a means of communication between the

upper and lower Magdalena. The Colombian Guard, by their energy in forwarding these works, have increased their already numerous claims to national recognition. They can justly boast that their sappers are the best road-makers in the country; five hundred and sixty of these are now working on the Girardot and Cauca lines. Engineers are now surveying the railways of Subachoque, Sanacá, and Pacho, in the valley of the Andes, and the reports already furnished on the first two are highly satisfactory. That of Samacá, which is the joint work of the national and of the local government of Boyacá, is spoken of as "an honor to America." The Scientific Exploration Commission, instituted by legal appointment, is now fully organized, and will shortly initiate its valuable investigations. The dredging and deepening of the river Magdalena are progressing rapidly under the favorable auspices of scientific organization and ample funds. The national elections for the renewal of the legislative and executive staff, as well as those for the partial renewal of a part of the staff of government officials in some of the States, have now taken place, and have been characterized throughout the republic by perfect freedom of expression and tranquillity. Dr. Zaldua is the Federal President-elect of the Congress, and he will be supported by able representatives of every shade of political opinion. The result of the elections may be regarded as highly favorable to the existing national policy of the present Government. This sketch of political consolidation, and of slow but sure industrial and scientific development, is not without its drawbacks. The inhabitants of the towns south of the Tolima, and some in the center of Cundinamarca, are experiencing the ravages of small-pox; while the locusts, which have not yet abandoned the Atlantic coast, still desolate the Cauca, and have appeared on the other side of Chicamocha, in the State of Santander. The seaport town of Buenaventura was almost completely destroyed by fire in April, 1881.

COLORADO. The Legislature met on January 4th and adjourned on February 15th. In his inaugural address Governor Pitkin called attention to the mistaken policy of mining corporations in issuing an excessive amount of capital stock, that practice having a tendency to create a prejudice against mining investments. Upon the subject of Chinese immigration and the Chinese residents of Colorado he spoke at considerable length and with much earnestness, dwelling upon the unwholesome social and personal habits of the Chinese, and upon the evil consequences of bringing their labor into competition with American labor. He deprecated violent outbreaks, such as occurred in Denver in the fall of 1880, but declared that the State, through its Legislature, should unite with the Pacific coast States in demanding congressional action prohibiting further Chinese immigration. He referred to

the death of Lieutenant-Governor George B. Robinson, who died on November 29, 1880, having been shot by mistake by one of the armed guards stationed at his mine, as suggesting the propriety of some legislative restriction upon the power of private corporations to employ armed guards for the defense of their property. He thought it would be wise to impose a severer penalty upon persons guilty of "mine-jumping," which would in part remove the necessity for armed guards. He recommended the establishment of a reform school for boys in connection with a State farm.

Very few important bills were passed by the Legislature. Some local feeling was excited over a new apportionment law passed near the close of the session, in which the ratio of representation in the State Legislature was fixed as set forth in the following sections:

SECTION 2. The ratios for the senatorial apportionment shall be: First, one Senator for the first 5,000 population; second, one Senator for each 9,000 population thereafter, with one Senator for fractions over 7,000 population.

SEC. 3. The ratios for representative apportionment shall be: First, one Representative for the first 1,000 population; second, one Representative for each 5,000 population thereafter, with one Representative for fractions over 3,000 population.

The representation of certain counties was further specifically prescribed in the bill. Arapahoe County was allowed eight Representatives and Lake County four, the former having a population of 38,607, and the latter 23,787. In behalf of these counties there were many protests against the reapportionment. A law was passed forbidding, under severe penalties, any person to engage in, promote, or aid any lottery, gift-enterprise, or any similar scheme in the State, or to advertise in a newspaper or otherwise any matter relating to a lottery. A law was also passed authorizing the Governor to appoint a State Fish Commissioner, with a salary of \$500 per annum, holding office for two years, and the sum of \$2,500 was appropriated to purchase grounds and erect a building for a fish-hatchery. For the expenses of maintaining the hatchery during the year ending June 1, 1882, the further sum of \$3,500 was appropriated, and for the second year \$3,000. Under this law the Governor appointed Wilson E. Sisty to be Fish Commissioner. A fish-hatchery was erected on the river Platte, about three fourths of a mile from Denver. It was opened on the 14th of December and stocked with 400,000 brook-trout eggs from the Old Colony trout-ponds at Plymouth, Massachusetts. The hatchery has fifteen troughs, with a capacity of 1,000,000 eggs.

There were no political conventions held during the year, and no general election took place, the balloting on November 8th being for district judges, district attorneys, and in one district (the sixth) for State Senator. At this election the question of the permanent location of the State capital was submitted to

the people. The Constitution of 1876 contained a provision that the capital should be at Denver until the first general election of 1881, when the electors of the State should by ballot designate their choice for the permanent seat of government. The total vote on the capital question was 45,497, of which 695 were cast for Salida, 2,788 for Canton City, 4,790 for Colorado Springs, 6,047 for Pueblo, and 30,248 for Denver, which city, having thus received a majority of all the votes cast, became the permanent seat of the State government. The vote for Governor in the election of 1880, as officially declared in the Legislature, was: Frederick W. Pitkin (Republican), 28,465; Hough (Democrat), 23,547. Owing to the death before his inauguration of the Lieutenant-Governor-elect, George B. Robinson, the Lieutenant-Governor of the previous administration, H. A. W. Tabor, continues to fill that position. In 1880 the vote for Garfield was 27,450, Hancock, 24,647; Garfield's majority, 1,368.

By the removal of the Utes and the Uncompahgre Indians from the Colorado reservation to Utah the State is rid of several thousand very undesirable denizens, and vast tracts of the most fertile lands in Colorado are made available for settlers. By the terms of the agreement between the United States and the confederated bands of the Utes, as set forth in the act of Congress approved June 15, 1880, it is provided that "the Southern Utes agree to remove and settle upon the unoccupied agricultural lands on the La Plata River in Colorado, and if there should not be a sufficiency of such lands on the La Plata River and in its vicinity in Colorado, then upon such other unoccupied agricultural lands as may be found on the La Plata River or in its vicinity in New Mexico." As no such quantity of lands as was contemplated in this agreement could be found in the locality indicated, its terms were changed and the Indians were induced to consent to a transfer to equally fertile and desirable lands in the Uintah reservation in the Territory of Utah. The Ute Indian Commissioners, Messrs. Mears, Russell, and McMorris, had several parleys with the braves in the course of the summer, and found them not disposed to keep their agreement. The commissioners named the 25th of August as the day for removal. The White River Utes went peaceably enough, but the Uncompaghres were inclined to fight. Under the orders of the Secretary of the Interior, the assistance of General McKenzie and a force of 800 troops was invoked by the commissioners. Though they outnumbered the white troops and were equally well armed, the Indians decided to obey, and on the 28th they started for the Utah reservation. During the autumn months there was a good deal of complaint that the Indians returned to the valleys of the La Plata and Uncompahgre Rivers to hunt, and that they annoyed settlers and interfered with the surveys of the Utah extension of the

Denver and Rio Grande Railroad then going forward. This matter was the subject of a correspondence between Governor Pitkin and Secretary Kirkwood. The Secretary called attention to the fact that as yet settlers have no rights upon the old reservation lands, for the protection of which they can properly invoke the aid of the Government, as those lands have not yet been formally opened for settlement. Nevertheless, white settlers flocked upon them as soon as the Indians retired, and for the most part the issuing of patents will be subsequent to taking possession. In the valleys of the streams on the reservation there is land enough for 1,500 ranchmen and stockmen, and the great fertility of the soil, the mildness of the climate, the abundance of fruit, vegetables, forage, fish and game of all kinds, will cause the whole region to be rapidly peopled. But few Indians now remain in Colorado, and these are in such close proximity to the whites, in the extreme southwestern portion of the State, that there is very little fear of any disturbance from them. The Uintahs and White River and Uncompahgre Utes are now located together along the Uintah River in Utah.

In the annual report of the Director of the Mint, Colorado is credited with a production of \$3,400,000 in gold and \$15,000,000 in silver for the fiscal year ending June 30, 1881, a total of \$18,400,000. The production of the previous fiscal year was somewhat larger, being \$3,200,000 in gold and \$17,000,000 in silver, a total of \$20,200,000. Local estimates put the total bullion product of the calendar year 1881 at \$23,500,000, of which more than half, or \$13,170,576, was turned out by the smelting-works in and about Leadville. There was more hard, intelligent, and well-directed work done in the mines of Colorado in 1881 than in any previous year. The falling off in the out-put was due to failure of one or two leading mines previously yielding large amounts of ore, and the closing of half a dozen others through the incessant flow of water in their best workings. Some new mines were opened, but nothing in the nature of a "bonanza" was brought to light. A more serious falling off in the aggregate production was prevented only by a better system of working existing mines, the avoidance of wasteful methods, and a more careful attention to small results. By the use of better machinery the cost of treatment was in many cases materially reduced; grades of ore which were formerly considered worthless, and were thrown into the waste-dumps or left in heaps in the mines, were taken out and treated with fair profits. Not only in and around Leadville but throughout the mining districts there was evidence that the era of wild speculation and extravagant expectations is rapidly passing away. There is a growing disposition to take a more sober and sensible view of the business of mining, to be content with returns which would be recognized as liberal in any other business, and to manage a mine with a

view to a production within reasonable limits, but constant, rather than in the foolish hope of sudden and enormous gains. Instead of issuing an excessive amount of capital stock and trying to pay a dividend on the first batch of ore smelted, mine-owners are now beginning to put faith in the wiser policy of moderate capitalization, with a sufficient amount paid up to develop the mine and put it in order for uninterrupted and productive working. In fissure-mining, for instance, experience has proved that a manager can not undertake to pay dividends before the shaft has been sunk 500 feet, with four or five levels at intervals of from 75 to 100 feet; and, until adequate hoisting and pumping machinery has been provided, and a large reserve of ore is on hand or in sight, no prudent manager will attempt to divide any money among the share-holders. It was through following the old, reckless methods of mining development that the state of things described in the following paragraph from an article in a Denver newspaper was brought about:

The records of each mining county, and those of the Secretary of State, are burdened with mining corporations with capital stocks ranging from ten thousand to twenty million dollars. Outside of Leadville very few of these have paid any dividends at all. It is safe to estimate that ninety-five hundredths of them never will pay dividends as at present organized and conducted. A large proportion of them are conceived in fraud and full of iniquity from top to bottom. A great many are dangerous schemes, to be avoided by honest men.

The horizontal veins in the vicinity of Leadville have thus far yielded large returns. It is the opinion of the State Geologist that upright or inclined fissures will ultimately be found in the granite formation beneath the volcanic rocks in which ores are now being mined. This theory is confirmed by discoveries lately made in various parts of the State. Some of the telluride veins are of enormous richness. One mine yielded ores which, for nearly two years, gave an average of over five thousand dollars per ton in gold, and some ores yield as high as eighty dollars per pound.

Coal, iron, and petroleum are now among the products of Colorado, the two former being turned out in considerable quantities. At Rico, coking coal of a high quality is found in great abundance. A valuable lignite is produced at Como, in the South Park; and unlimited quantities of anthracite and bituminous coal are found at Gothic, Irwin, and Rugby mining-camps. The lignitic coals, found in the northern part of the State, are very dense, jet-black in color, of a high luster, and without any fibrous or woody structure. They have an average specific gravity of 1.33, are remarkably free from sulphur, the average admixture not exceeding one per cent; and they burn readily and freely, with a high heating power, and a small residuum of ash. Some of the mines from which these coals are obtained have been worked continuously for twenty years. None

of them are exhausted, and only one or two show signs of a failing supply. Large deposits of excellent iron-ore are being worked at Salida, in Chaffee County; and in the San Luis Valley, in Las Animas, Boulder, Jefferson, El Paso, and Arapahoe Counties, there are immeasurable stores of the metal awaiting future demand. Even in the Leadville silver-mines, iron-ore is yielded, as an incidental product, in sufficient quantities to supply a large part of the demand of the Pueblo Iron and Steel Works. Of oil-wells the State has at present but three—one, nine miles south of Cañon City, 1,448 feet deep; one, six miles north of the same city, now only eighty-five feet deep; and one other, in the same vicinity, which was bored to the depth of 1,200 feet, and then abandoned, though not until oil was obtained in small quantities. It is the opinion of experts that great oil discoveries are yet in store for Colorado.

The State is growing rapidly in agricultural importance. The soil is naturally of high fertility, and, through the cheap and effective method of irrigation by which the farmer is able to make a stream of water follow the plow almost at will, the risk of damage from long droughts is reduced to a minimum. The wheat-lands are made to yield twenty-five bushels to the acre, and the luxuriantly growing native grasses furnish an abundance of excellent hay and forage. The extremely cold weather of the winter of 1880-'81 caused an unprecedented mortality among the herds of cattle on the plains. Herdsmen estimate the loss at nearly thirty-three per cent of the total stock in the State. The tax-list of 1880 showed a total of 541,563 head of cattle in the State, but, as it is well known that about one third of the herds escape the assessor, the actual number was probably quite 850,000. The number at the close of the year 1881 was estimated at not over 600,000, with a valuation of \$16,000,000. The early spring and fine summer enabled the stock-raisers to make up for their winter losses in the year's sales, which surpassed those of any previous year, the price being from eight to twelve dollars higher per head than in 1880. Sheep also suffered severely in the storms of March and April, from forty to seventy-five per cent of the flocks perishing, according to location and the degree of exposure. The estimated number of sheep in the State is now 1,000,000, and their value is \$3,000,000.

It was believed that 100,000 buffalo skins would come from the Yellowstone region in 1881. This is without precedent in the fur trade. The last season 30,000 were received from the same region. The winter of 1880-'81 having been very severe and long, immense herds of bison concentrated in the few valleys where they could find subsistence. Their destruction continued during several months.

The population of the State, by counties, with the native and foreign distinguished, as returned by the census of 1880, is as follows:

COUNTIES.	Total.	Native.	Foreign.
The State.....	194,649	154,869	39,570
Arapahoe.....	38,645	29,353	9,292

Boulder City.....	3,176	Greeley.....	1,303
Golden.....	2,731	Ouray.....	1,004
Central City.....	2,626		

The records of the Auditor of State show the assessed valuation of Colorado for the year 1881 to be \$96,059,985.48. The valuation of 1878 was \$43,072,648.26; for 1879, \$59,590,761.30; for 1880, \$73,050,761.89, showing a steady annual increase of about thirty per cent. The number of acres of assessable land in the State is 2,155,340, which, with improvements, is valued at \$15,168,790. The State Board of Equalization, in April, increased the assessment-rate on the main lines of railroads running through the State by \$500 per mile. This makes the rate \$6,500 per mile on broad-gauge and \$5,000 per mile on narrow-gauge roads. With 1,584 miles of railroad in the State, this gives a valuation of \$11,638,055. The other items of the tax-list are as follows: Merchandise, \$6,674,322; capital and manufacturing, \$865,626; town and city lots, \$32,910,993; horses, numbering 70,133, \$2,732,568; mules, \$458,128; asses, \$6,558; cattle, numbering 411,970, \$4,611,359; sheep, numbering 634,542, which is far below the real number, \$1,000,041; swine, \$19,102; goats, \$5,277; all other animals, \$30,247; musical instruments, \$239,230; watches and clocks, \$250,513; jewelry, gold and silver plate, \$106,866; money and credits, \$3,473,847; carriages and vehicles, \$767,753; household property, \$607,138; all other property, \$13,354,120; bank and other

shares, \$882,780; insurance premiums, \$186,669. The number of business failures was 107, against 78 in 1880. The total liabilities were \$763,000, and the assets \$502,000, a net increase in loss sustained of \$57,000 over the preceding year. The increase in the number of dealers was about one fourth. The total State debt on November 30, 1881, was \$330,185.78, against which there was a balance in the Treasury of \$45,064.97.

The following is a statement of the operations of the State Treasury for the year ending November 30th, showing receipts amounting to \$373,302.31, exclusive of cash in the Treasury, and an expenditure of \$395,384.33:

RECEIPTS.

Balance in Treasury on November 30, 1880.....	\$67,146 99
Receipts of general revenue (four-mill tax).....	245,880 26

Murder on Indian reservation.....	5
Embezzlement from army department.....	2
Embezzlement as Indian agent.....	1
Perjury before United States Receiver of Land-Office.....	1
Bigamy.....	1
Counterfeiting.....	4
Cutting timber on United States mineral lands.....	45
Total.....	108

The railroad system and railroad business of the State developed with surprising rapidity during the year. In the ten months ending November 30th, the Denver and Rio Grande road, the most important line in the State, laid 629 miles of steel rails, and built 374 miles of new road. In that period its net earnings were \$2,158,693, against \$1,372,468 in the corresponding ten months of the preceding year. The Union Pacific Railroad's Omaha and Denver Short Line was completed, bringing the two cities fifty miles nearer together than by any other route. The wheat-crop of the State was about 1,600,000 bushels, against 1,425,104 in 1880, and 258,474 in 1870. Congress, by various acts, has granted to the State of Colorado 713,322 acres of land, divided as follows: For internal improvement, 500,000 acres; for public buildings, 32,000; State penitentiary, 32,000; State University, 46,080; miscellaneous, including salt springs, 46,080; school lands, 57,152. For 420,596 acres of these lands the State has already received patents from the United States, and is in possession.

Colorado is becoming a favorite resort for invalids, its many mineral springs and extremely salubrious atmosphere giving it a high reputation among the world's sanitarium. The subjoined table gives the elevation above the level of the sea of some of the prominent towns in the State:

	Fet.		Fet.
Alamosa.....	7,000	Green Lake.....	10,060
Alma.....	11,044	Hot Sulphur Springs..	7,715

Greeley.....	4,776		

A system of sewerage, on what is known as the Waring plan, has been begun in Denver, and is being rapidly pushed forward. The death-rate of the city for the year was only 17.50 per thousand; the total number of deaths was 698, divided, in respect to diseases and causes, as follows: zymotic diseases, 213; constitutional, 148; local, 223; developmental, 27; violence, 57.

COMMERCE AND FINANCE, AMERICAN, IN 1881. The grandeur of the present epoch of American commerce and production can be measured by the magnitude of the agricultural exports which are its chief cause and characteristic. The total value of the exports of breadstuffs for the three years ending June 30, 1881, was \$749,470,445, having been \$265,561,328 in 1881, \$282,132,168 in 1880, and \$201,776,499 in 1879. The exports of wheat

and flour were 185,000,000 bushels in 1881, about 180,000,000 bushels in 1880, and 143,000,000 bushels in 1879, aggregating for the three years 508,000,000 bushels, valued at \$591,524,024. The exports of 1880-'81 thus exceeded those of the previous year, notwithstanding the better crops in Great Britain and Western Europe. This was owing to the depletion of stocks as well as to an increase in consumptive capacity. A reputation for American brands of flour has been established in England with such success that 8,500,000 more bushels of wheat were exported in the manufactured form in 1881 than in 1880. Prices ranged lower in 1881 than in the year preceding, so that while the quantity exported was 5,500,000 bushels greater, the total value was \$13,000,000 less, or \$211,277,588, against \$224,705,803; while the value exported in 1879 was only \$155,540,633. A calculation of the average export prices gives \$1.15 per bushel in 1881, \$1.25 in 1880, and \$1.09 in 1879. Wheat exports for the last six months of the fiscal year 1880-'81 were unusually large for that portion of the crop year, being 11,000,000 bushels in excess of the exports for the corresponding half of 1879-'80. While the good crops of the West of Europe did not, therefore, lessen the demand for wheat, the exports of rye and oats showed a great falling off from those of the preceding fiscal years. The rye exports were 1,928,355 bushels, against 2,912,744 bushels in 1880, and 4,848,249 bushels in 1879; the oat exports, 358,250 bushels in 1881, 710,890 in 1880, and 4,654,794 in 1879. The exports of Indian corn were about 91,000,000 bushels in 1881, against 98,000,000 in 1880, and 86,000,000 in 1879. The only cereal of which the exports form a considerable portion of the crop is wheat. While the normal export demand will probably prove considerably less when crops are fair in Western and Central Europe, there must be a constant and increasing demand for American wheat, which can be much more cheaply grown on the prairie humus than on the heavy and manure-requiring soils of Europe. If the American producers can adjust themselves without hardship to the normal demand, there will continue in action a favorable stimulus even after European rents have, to a considerable extent, vanished; while any cheapening in the cost of transportation will give the American producer a new advantage. Counting the crop of 1880 at 480,000,000 bushels, the exports of 1880-'81 constituted about 38½ per cent of the total wheat product.

The trade returns for the year ending June 30, 1881, show a larger total commerce than any previous year; a larger exportation of merchandise by 8 per cent than the preceding year, the next largest on record, and 33 per cent larger than the average of the last five years previous; merchandise imports almost as great as those of 1879-'80, when they were stimulated by a mania for speculation preva-

lent in the first part of the year; and a net importation of specie exceeding considerably that of the first year of resumption. The excess of exports over imports exceeded that of any other year except 1878-'79. The imports exceeded in value, and greatly exceeded in quantity, those of the years preceding the panic, which consisted largely of railroad-iron, etc., which left an adverse balance of unprecedented magnitude, and which, it was thought, were far beyond the natural consumptive powers of the people, and would not be equaled again in many years to come. The export movement was so heavy in the earlier part of the calendar year, as soon as the railroads were free from obstructions and the canals open, that in the month of June they fell off nearly \$9,000,000. The high price of provisions was the cause of much lighter shipments under that head. The table on page 122 affords a comparative survey of the foreign trade movements for the past twenty-one years.

Including the specie imports and exports, the total foreign commerce of 1880-'81 amounted to \$1,675,024,378. The increase of exports over those of the preceding year was \$66,738,688. Since 1876, when the exports began to exceed the imports, the aggregate excess of exports has been \$1,180,668,105 for the six years. The total value of the exports of domestic merchandise in 1880-'81 was \$883,925,947, exceeding those of the preceding year by \$59,979,594. The exports of breadstuffs, \$270,332,519; cotton and its manufactures, \$261,267,133; provisions, \$151,528,268; mineral oils, \$40,315,609; tobacco, \$20,878,884; wood and its manufactures, \$18,600,312; iron and steel and their manufactures, \$16,608,767, and live animals, \$16,412,398—constituted 90 per cent of the total domestic exports, the eight items summing up \$795,943,890. The grain exports fell below those of 1879-'80 \$17,704,316. In the exports of raw cotton there was an increase of \$36,159,841; in the value of provision exports, \$24,485,026 increase; in petroleum, \$4,096,984; in tobacco, raw and manufactured, \$2,436,611; in wood manufactures and timber, \$2,362,932; in iron and steel and their manufactures, \$1,892,243; in live animals, \$530,278. A comparison of the returns of 1880-'81 with those of 1870-'71 shows that over four fifths of the total increase, amounting to considerably more than 100 per cent, is made up of the increased exports of breadstuffs, provisions, and tallow, cotton, live animals, leather, and wood and manufactures thereof. The increase in the annual exports of these commodities in twenty years amounts to \$374,059,476; and four fifths of this collective increase is due to the increased exports of breadstuffs, provisions and tallow, and live animals alone. The products which have thus swelled the export trade are chiefly products of the Western and Northwestern States. The increase in the exportation of the products of that part of the country is traced by the Chief

Value of Imports and Exports of Merchandise from 1861 to 1881, inclusive—Specie Values.

YEAR ENDING JUNE 30.	Total exports.	Imports.	Excess of exports or imports.	Total imports and exports.
1861	\$219,553,838	\$289,310,542	Imports, \$69,756,709	\$508,864,375

of the Bureau of Statistics to the recent extension of railroads and the great reduction in the cost of railroad carriage from the West to the Atlantic sea-board. Of the total receipts of grain in 1880 at New York, Baltimore, Philadelphia, Boston, and Portland, amounting to 319,696,057 bushels, 76·97 per cent was brought by rail, and only 22·24 per cent by the Erie canal. The average freight-rates for transporting grain from Chicago to New York for the last three years compared with the average rates for 1870, 1871, and 1872, show a reduction in this charge of 9·8 cents on a bushel. The average reduction in the railroad transportation rates amounts to 14·4. The mean reduction in the cost of carriage between the two points is about 13 cents per bushel. This is equivalent to 11·7 per cent on the export price of wheat and 23·55 per cent on the export price of Indian corn in 1881. According to the researches of Joseph Nimmo, Jr., Chief of the Bureau of Statistics, the tonnage on twelve of the leading railway lines increased between 1873 and 1880 from 45,557,002 to 78,150,913 tons, or 71·5 per cent, while the freight receipts increased from \$112,004,648 to \$143,388,178, or only about 28 per cent. The average rate per ton per mile was reduced from 1·72 cent to 1·07 cent, a decrease of 39·5 per cent. The tonnage transported on the New York Central, Erie, and Pennsylvania Railroads was three times as great in 1880 as in 1868, while the average freight charges were 60 per cent less. Between 1870 and 1880

there was a reduction of 39·45 per cent in the freight charges of those roads, and of 32·51 per cent on the rates of the New York canals, while the decrease in the average prices of the prime necessities of life in the same period was only 12·32 per cent. The wheat exports have increased under these changed conditions from \$47,171,229 in 1870 to \$167,698,485 in 1881; the value of maize exported, from \$1,287,575 to \$50,702,669; of provisions, from \$29,175,539 to \$151,528,268; of live animals, from \$1,045,039 to \$16,412,398. The value of all the exports of agricultural products in 1881 amounted to \$729,650,016, an increase of \$43,688,925 over those of 1880. Their value constituted 82·55 per cent of the total exports of domestic merchandise. It was seven times the value of this class of exports in 1850, nearly thrice the value of such exports in 1860, and more than twice their value in 1870. The growth of the total export trade has been at about the same rate of progression. The ratio of agricultural products to the whole value of the exports does not deviate, in comparing the years 1830, 1840, 1850, 1860, 1870, and 1881, more than 3 per cent.

Of the total value of imports in the fiscal year 1881, aggregating \$642,664,628, the imports of sugar and molasses constituted 14·53 per cent, amounting to \$93,404,288; the value of the imports of coffee amounted to \$56,784,391, or 8·84 per cent of the total; of iron and steel and manufactures thereof, to \$46,439,747, or 7·23 per cent; of silk, raw and manufactured,

to \$42,944,965, or 6.68 per cent; of chemicals, drugs, dyes, and medicines, to \$36,590,473, or 5.69 per cent; of the imports of cotton manufactures, and cotton, to \$31,976,637, or 4.97 per cent. The total value of these seven classes, \$349,000,895, constituted 54.30 of the total imports of merchandise.

The excess of exports decreased in the last half of the calendar year, due mainly to the smaller supply of breadstuffs for exportation. The wheat crop, though only 400,000,000 bushels, against 500,000,000 in 1880, yielded about 3 per cent more to the farmers.

The total value of imports of merchandise entered for consumption in the United States amounted to \$650,618,999. The value of dutiable merchandise amounted to \$448,061,537.95; merchandise free of duty to \$202,557,411. The total amount of duties collected upon imports amounted to \$193,800,879, and constituted 43.25 per cent of the value of the dutiable merchandise entered for consumption. Of the total amount of duties collected on imports the duties on sugar and molasses amounted to \$47,984,032, or 24.79 per cent; the duties on wool and woolen manufactures to \$27,285,624, or 14.10 per cent; the duties on iron and steel and manufactures thereof to \$21,462,534, or 11.09 per cent; the duties on manufactures of silk to \$19,038,665, or 9.84 per cent; the duties on manufactures of cotton to \$10,825,115, or 5.59 per cent; the duties on flax and manufactures thereof to \$6,984,374.90, or 3.60 per cent. The duties collected on these six commodities and classes of commodities amounted to \$133,580,347, and constituted 69.01 per cent of the total duties collected on imports. There was collected at the port of New York \$136,211,127.38, or 70.28 per cent of the total import duties received during the year by the Government. The aggregate balance of trade in favor of the United States in the commerce of the year with those countries which received American exports in excess of the value of the imports from them, was \$441,675,687. The aggregate adverse balance in the commerce with those countries from which the United States imported merchandise to a greater amount than the value of the exports to them, was \$181,962,969. The countries which received American exports largely in excess of their imports into the United States, are the United Kingdom, France, Belgium, Netherlands, Germany, Russia, Spain, and Denmark. The countries the imports from which largely exceeded American exports taken by them, were Cuba, Brazil, India, China, Japan, Spanish possessions other than Cuba and Porto Rico, and the Dutch East Indies. The subjoined table gives the percentage of the total imports of the year furnished by each country, the percentage of the domestic exports taken by each, also the foreign exports, and the percentage of each one in the total import and export commerce of the United States, according to values:

COUNTRIES.	Per cent of im-ports.	Per cent of domestic ex-ports.	Per cent of foreign exports.	Per cent of imports and exports.

The proportion of each of the principal sea-ports in the total export and import commerce of the year, as compared with 1879-'80, is shown in the table below, which gives the percentage of each port in the total merchandise trade each way. The gain of the minor ports not named is explained by the increased cotton shipments. An increase in the imports of one or two lake ports in October was due to shipments of Canadian grain, attracted by the spec-

ulative prices prevailing. The diminished percentage of New York is chiefly attributable to the same cause. The larger share of New Orleans in the export trade comes from its new business as a shipping port for grain:

PORTS.	EXPORTS.		IMPORTS.	
	1880-'81.	1879-'80.	1880-'81.	1879-'80.
	P. c.	P. c.	P. c.	P. c.
New York.....	45·12	46·98	67·77	68·86
New Orleans....	11·50	10·82	1·90	1·50
Baltimore.....	8·08	9·18	2·52	2·99

Total.....	100·00	100·00	100·00	100·00

Of the total merchandise exports and imports of the year, 54 per cent, or \$842,631,927, passed through the port of New York. The navigation returns for the fiscal year 1880-'81 show that the decline of the American merchant marine still continues. Although the tonnage of vessels built increased from 157,409 tons in 1879-'80 to 280,459 tons in 1880-'81, the decay of vessels and losses by casualties was not made good by the increase in ship-building. On the 30th of June, 1881, the total tonnage of the country amounted to 4,057,734 tons, as against 4,068,035 tons at the close of the preceding fiscal year. The tonnage employed in the foreign trade of the United States decreased from 1,314,402 tons in 1880 to 1,297,035 tons in 1881, but the tonnage employed in the coast-wise trade of the United States, embracing tonnage employed between American ports on the sea-board, on the Mississippi River and its tributaries, and on the Great Lakes, increased from 2,637,886 tons in 1880 to 2,646,011 tons in 1881. The foreign commerce of the United States has nearly doubled since 1866, but the increase in the carrying trade has fallen almost entirely to vessels of foreign nationality. The total tonnage of foreign vessels entered at sea-ports of the United States increased from 3,117,034 tons in 1856 to 12,711,392 tons in 1881, an increase of 308 per cent; whereas the American tonnage entered for foreign ports increased from 1,891,453 tons in 1856 to 2,919,149 tons in 1881, an increase of only 54 per cent. Of the total foreign tonnage entered at ports of the United States during the year ended June 30, 1881, amounting, as above stated, to 12,711,692 tons, the British tonnage amounted to 8,457,957 tons, or 66·5 per cent; the German tonnage to 1,112,566 tons; the Norwegian and Swedish to 1,035,078 tons; the Italian to 658,861 tons; the French to 304,809 tons; the Spanish to 277,163 tons; and the tonnage of all other nationalities to 805,121 tons.

The annual values of the total imports and exports of the United States carried in American and those carried in foreign vessels, and the percentage of American shipping in the total carrying trade, are given for the last thirty years in the following table:

FISCAL YEAR.	Carried in United States ships.	Carried in foreign ships.	Percentage carried in U. S. ships.
1852.....	\$294,785,404	\$128,219,817	70·5
1853.....	346,717,127	152,287,677	69·5
1854.....	406,698,639	170,591,875	70·5

1879.....	272,015,692	911,269,282	23·0
1880.....	280,005,846	1,809,466,596	17·6
1881.....	268,080,608	1,375,556,017	16·2

The American cotton-crop of the year 1880-'81, as estimated by the "Commercial and Financial Chronicle," aggregated 6,589,329 bales. The largest crop picked in slavery times was in the second year before secession. This was first equaled by the crop of 1878-'79. The next year's crop, counted in bales, was 13½ per cent greater, and last year 14½ per cent greater than that. The average crop of the last three years exceeds the average of the three prolific years preceding the civil war by nearly one third. Below is reprinted a table giving every year's cotton-crop since the record was first kept, completed to date:

YEARS.	Bales.	YEARS.	Bales.
1880-'81.....	6,589,329	1854-'55.....	2,932,389

The average gross weight of the bale in 1881 was 485·88, or 4·33 pounds more than the average of the preceding year, indicating an actual increase in the total weight of the crop of 15·48 per cent. The total weight of the last eight crops and the average weight of the bales each year were as follows:

SEASON OF	Weight of crop in pounds.	Average weight of bales.
1880-'81	8,201,546,730	455.88
1879-'80	2,772,448,480	481.55
1878-'79	2,400,205,525	478.08
1877-'78	2,309,905,907	450.10
1876-'77	2,100,465,086	465.23
1875-'76	2,201,410,024	471.46
1874-'75	1,786,984,765	468.00
1873-'74	1,956,742,297	469.00

The crop of 1880-'81 was matured and picked amid heavy rains, and packed in a damp and dirty condition. The waste was consequently exceptionally great, while the preceding crop had been remarkably clean and superior in spinning qualities. The crop of Sea-Island cotton in 1880-'81 was 36,442 bales, against 26,704 bales in 1879-'80, 22,963 in 1878-'79, and 24,825 in 1877-'78. The largest previous crop was 32,228 bales in 1866-'67. American consumption of Sea-Island cotton for the year was 11,270 bales, or 1,881 more than in 1879-'80.

The extension of cotton cultivation falls in with and responds to an expansion of the world's demand, which has been progressive since the commencement of a new era of activity in the summer of 1879. The revival commenced with the return of prosperity in the United States. European consumption has increased over one million bales in two years, as seen from the following statement:

IN BALES OF 400 LBS.	Great Britain.	Continent.	Total.
1878-'79	2,843,000	2,596,000	5,439,000
1879-'80	3,350,000	2,725,000	6,075,000
1880-'81	3,572,000	2,956,000	6,528,000

The increase in the consumption of Great Britain over that of 1879-'80 was $7\frac{1}{2}$ per cent, in that of the Continent $8\frac{1}{2}$ per cent; but $2\frac{1}{2}$ per cent must be deducted as representing increased waste in the crop, leaving the actual increase in European consumption $5\frac{1}{2}$ per cent. Ellison estimates the requirements of Europe for the year commencing October 1, 1881, at 6,708,000 bales of 400 pounds, of which 1,960,000 bales may be expected to come from India, Egypt, and countries of smaller production, and 4,748,000 bales, or 4,165,000 bales of 456 pounds, from the United States. To supply this and furnish 2,050,000 bales for American consumption, a crop of 6,215,000 bales in 1881-'82 would be sufficient.

The exports of American cotton to foreign ports, during the year ending September 1st, were 4,589,075 bales; the overland shipments to Canada, 22,898 bales. The total exports of raw cotton to foreign ports for the last six years were, 4,596,279 bales in the crop year 1881; 3,865,621 bales in 1880; 3,467,565 in 1879; 3,346,640 in 1878; 3,049,497 in 1877; and 3,259,994 in 1876.

The takings of American mills from the crop of 1880-'81 were 1,891,804, and the total consumption is estimated as high as 1,915,000

bales. The takings of the Northern and Southern mills, and the estimated total consumption in the United States for a period of years, were as follows:

CROP YEAR.	Northern takings.	Southern takings.	Total takings.	Estimated consumption.
1881	1,686,804	205,000	1,891,804	1,915,000
1880	1,624,805	179,000	1,803,805	1,760,000
1879	1,416,960	152,000	1,568,960	1,625,000
1878	1,395,295	148,000	1,546,298	1,530,000
1877	1,288,418	147,000	1,435,418	1,435,000
1876	1,211,595	145,000	1,356,595	1,310,000

The state of the markets was favorable to American manufacturers. The domestic demand was active enough to keep every spindle going. Prices kept up well, and afforded a good margin of profit. A long drought diminished the water-power in the North, reducing the productive capacity 12 or 15 per cent for about four months, but there was enough to work up the stock of material into the heavy drills and sheetings which were in demand. The addition of new spindles is estimated at 375,000, making the total number in the country at the close of the year 11,875,000. A considerable substitution of new spindles for old ones further increased the capacity for the production of yarn. The price of printed cloths was $3\frac{1}{2}$ cents at the commencement of the crop year, ranged up to $4\frac{1}{2}$ cents in the winter, standing above 4 cents until March, and between that and $3\frac{1}{2}$ cents most of the time afterward, and closed at $3\frac{1}{2}$ cents a yard at the end of the year. Standard sheetings were quoted at $7\frac{1}{2}$ cents in the opening months, $8\frac{1}{2}$ cents in the winter and spring, 8 cents in the early summer, and $8\frac{1}{2}$ cents at the close of the year. Prices thus ruled lower than the figures to which they were pushed by speculation in the preceding season. Trade was active the year round, without any dull interval. The prices of material were lower than in the previous season, but the difference was partly offset by the additional wastage. Low middling uplands commenced at $11\frac{1}{2}$ cents per pound in September, went down to $10\frac{3}{4}$ cents in November, recovered to $11\frac{1}{4}$ cents in December, stood above 11 cents till March, fell off to $9\frac{1}{2}$ cents in May, and advanced again to $11\frac{1}{4}$ cents at the year's close. The higher price of wages was an element of cost which must be taken account of in estimating the results of the year's business. An estimate of the average profit has been made by the editor of the "Commercial and Financial Chronicle." Those managers who have bought their cotton at favorable times, and conduct their mills most economically, may have realized two or three times the estimated rate of profit. Assuming the cost of cotton for standard sheetings to have been 12 cents a pound, the waste 2.26 cents, and the cost of manufacture and sale 6.50 cents, the cost of the product per pound would be 20.76 cents, or 7.27 cents per yard, which at an average selling price of 8.50 cents per yard

would yield a profit per yard of 1·23, or 3·52 cents on the pound of cotton. Counting the cost of material for print-cloths at 11·25 cents a pound, the waste 2·30 cents, and the cost of making and marketing 12 cents, the cost of the goods would be 25·55 cents a pound, or 3·65 cents a yard on delivery; at 4 cents a yard selling price there would remain a profit of ·35 cents a yard, or 2·45 cents a pound.

An increase in the exports of cotton goods in 1880-'81, when the home demand was suffi-

cient to exhaust the stocks and keep all the mills busy, is a gratifying indication that improvements in manufacturing facilities and the acuteness of domestic competition are approaching the point where American manufacturers will be disposed to contest the neutral markets with Great Britain. The lower prices of cotton are favorable to the export movement. The values and quantities of cotton manufactures exported in the last four fiscal years were as follows:

EXPORTS OF COTTON GOODS.	1881.	1880.	1879.	1878.
Colored goods, yards.	68,184,293	87,758,166	45,116,058	87,765,313
" value.	\$4,983,818	\$2,956,760	\$3,209,255	\$2,959,910
Uncolored goods, yards.	80,399,154	63,821,567	84,051,819	58,528,192
" value.	\$6,624,374	\$5,884,541	\$6,288,181	\$7,053,463
Other manufactures of goods, value.	\$1,963,601	\$1,190,117	\$1,356,534	\$1,422,287
Total cotton manufactures exported, value	\$13,571,287	\$9,981,413	\$10,553,950	\$11,435,660

There were 2,133 national banks doing business on November 1, 1881, a larger number than in any previous year since the passage of the banking act in 1863. The number of banks organized during the year was 86, a larger number than in any previous year. The number of banks which went out of business during the year was 26, having an aggregate capital of \$2,020,000 and a circulation of \$1,245,530. The capital of the 86 newly started banks aggregates \$9,651,050; the notes issued to them, \$5,233,580. The total number of banks which have been organized since the introduction of the system is 2,581. The number which have voluntarily gone into liquidation is 340; the number which have been placed in the hands of receivers, 86. The insolvent banks have paid \$18,561,698 in dividends to creditors out of \$25,966,602 of proved claims. The annual loss is therefore about \$346,000 on \$450,000,000 of average capital, and \$800,000,000 of deposits. The capital of the 2,115 national banks in operation on June 30, 1881, was \$460,227,835, not including the surplus, which amounted to about \$126,000,000. The total capital of all the State banks, savings-banks, and private bankers, aggregated \$210,738,203, or but little more than a third of the combined capital and surplus of the national banks. The number of private bankers doing business in sixteen of the principal cities of the Union is 717; their aggregate capital, \$58,534,300; deposits, \$89,996,545; reserve invested in United States bonds, \$12,370,012. Private bankers outside of these cities with over \$10,000 capital, to the number of 2,255 in 31 States and Territories, have an aggregate capital of \$84,169,435, and deposits to the amount of \$148,178,652. Private bankers in the remaining States and Territories, to the number of 66, have \$620,120 aggregate capital, and \$3,670,357 deposits. Massachusetts and Maryland (outside of the cities of Boston and Baltimore), Maine, North Carolina, New Hampshire, New Jersey, Delaware, and Vermont, have but 27 private banking houses together. In New

York city there are 508, in Philadelphia 52, in Boston 47, in Chicago 24, in Baltimore 19.

The following table exhibits the amount of loans, capital, surplus, net deposits, specie and paper money in the national banks in New York city, in the other reserve cities, in the States and Territories, on October 1, 1881:

ASSETS AND LIABILITIES.	New York city, 48 banks.	Other reserve cities, 189 banks.	States and Territories, 1,895 banks.
Loans.	\$246,757,659	\$346,221,151	\$576,048,494
Capital.	51,150,000	119,799,890	292,572,155
Surplus.	19,947,316	84,162,895	74,030,407
Net deposits.	268,769,373	335,669,226	507,200,770
Specie.	50,627,368	34,535,367	27,509,521
Legal tenders and U. S. certificates..	10,898,871	21,899,231	27,093,002

The loans of the banks on October 1st were \$1,169,022,304, which is an increase of \$132,000,000 over the corresponding date in last year. The total individual and bank deposits, not deducting the amount due from banks and the clearing-house exchanges, have increased \$225,725,496, amounting to the unprecedented sum of \$1,381,852,887. The rate of the total loans to capital, surplus, and net deposits was then 68·9 per cent; in 1880 it was 67·3 per cent, and in 1879 75·3 per cent. The proportion of cash to net deposits was 15·5 per cent on October 1, 1881, and for the corresponding dates in 1880 and 1879 it was 17·9 and 18 per cent.

The bonds held by the banks to guarantee their circulation are now principally $3\frac{1}{2}$ and 4 per cents, there being about \$241,000,000 of the former, and \$92,000,000 of the latter.

The national banks, with the exception of those of New York city, have been steadily accumulating a gold reserve since the date of resumption. The specie reserve held by the New York banks on the 1st of January, 1879, was \$18,161,092; by the other banks of the country, \$23,338,665; together, \$41,499,757. By the end of the year the New York banks had increased their reserve to about \$50,000,000, and the other banks to about \$30,000,000. At the

beginning of 1881 the New York banks held \$55,221,200, and the banks of the rest of the country \$51,650,269. In March the New York reserves had fallen to \$51,000,000, in May they had increased again to \$65,000,000, and on June 30th to \$67,393,400, falling off afterward to \$51,000,000 in October. The reserves of the other banks of the country increased progressively to \$53,500,000 in March, \$57,500,000 in the first week of May, \$61,245,000 on June 30th, and \$63,000,000 in October.

The Comptroller of the Currency states in his report that he has been unable to obtain any evidence showing that the action of the banks in depositing legal-tender notes and withdrawing bonds pending the action of Congress on the funding bill, was concerted in order to derange the money market. Such a course, he says, would dangerously affect the value of the securities held by the banks against call loans. The banks of New York city had loaned out \$97,000,000, and all the banks throughout the country \$196,000,000 on demand, secured by collaterals which would be seriously depressed in value in a money panic.

The number of national banks which deposited legal-tender notes for the purpose of obtaining possession of their bonds in anticipation of the passage of this bill was one hundred and forty-one. These banks were located in twenty-four States, and the amount of legal-tender notes deposited by them was \$18,764,434. Only about one third of the bonds which were thus released were subsequently redeposited, and for some months thereafter the total amount of bonds redeposited by the one hundred and forty-one banks which reduced their circulation was less than \$7,000,000.

From an investigation made by Comptroller Knox, it appears that the financial settlements made by checks and bills of credit through the banks of New York amount to about three fifths of the business transacted by the aid of such instruments throughout the United States. The clearing-house settlements for the year ending October 1st aggregated about \$48,000,000,000. The total financial transactions of the country effected by instruments of credit would be, therefore, some \$80,000,000,000 for the year. That portion of the total payments which are due to fictitious operations on the Stock Exchange should be subtracted in order to arrive at the volume of the legitimate business of the country indicated by the bank exchange. About 5 per cent of the total transactions, it is found, are liquidated in money, and 95 per cent are discharged by means of checks, drafts, and other instruments of the kind.

From the date of resumption to November 1, 1881, the imports of gold in excess of exports amounted to \$197,434,114, and the estimated gold production of the country for the same period was \$104,150,000. The increment from both sources for the year ending November 1st was \$114,749,390. Silver dollars are

coined at the rate of about \$2,300,000 a month, the total coinage for the year ending November 1st having been \$27,824,955. The total amount of coin and currency in the United States at the date of the Comptroller's report, compared with the amount a year previous, was as follows:

	November 1, 1880.	November 1, 1881.
Gold coin.....	\$453,832,692	\$562,568,971
Silver coin.....	158,320,911	186,087,365
Legal-tender notes.....	846,681,016	846,681,016
National-bank notes.....	343,834,107	800,344,250
Totals.....	\$1,802,718,726	\$1,455,681,602

The amount of legal-tender notes in circulation has remained the same since May 31, 1878, in accordance with law. The additional issue of national-bank notes during the year was \$16,510,143. The increase of bank-notes, gold coin, and silver coin, amounted to \$152,912,876. On November 1st there was held in the Treasury \$167,781,909 of gold, against \$133,679,349 at the same date in 1880; \$66,576,378 in standard silver dollars, against \$47,156,588 in 1880; \$3,424,575 in silver bullion, against \$6,185,000; \$25,984,687 in fractional silver currency, against \$24,635,561; \$22,774,830 in paper currency, against \$18,221,826. The national banks held \$107,222,169 of gold coin and certificates, against \$102,851,032 in 1880; \$7,112,567 of silver dollars, against \$6,495,477; \$77,630,917 of currency, against \$25,828,794. The State banks held \$19,901,491 of gold, against \$17,102,130. In the savings-banks there was \$11,782,243 of currency, against \$17,072,680 in 1880 at the same date. The total amount of coin and currency in the Treasury and the banks on November 1, 1881, was \$537,583,083, as compared with \$485,668,362 on the same date in 1880. Deducting the amount thus retained from the total amount in the country, the amount of money in the pockets of the people on November 1, 1881, was \$918,048,519, against \$817,050,364 in 1880.

The total amount of silver dollars coined up to November 1, 1881, was \$100,672,705. Of the \$66,576,378 in the Treasury, \$58,838,769 was represented by certificates in the hands of the people and the banks, leaving only \$7,737,609 actually belonging to the Treasury. Of the \$100,672,705 coined, therefore, \$34,096,327 were circulating in the form of coin and \$58,838,769 in the form of certificates. The remainder of the silver, \$85,364,660, is in subsidiary and trade dollars and bullion, of which \$29,409,262 is in the Treasury, and \$55,955,398 is in use in place of the previous fractional paper currency, which at its highest point, on March 23, 1874, amounted to \$49,566,760.

The product of the precious metals in the United States reached its highest point in 1877, when the mines of Nevada alone yielded \$51,580,290—within a few hundred thousand dollars of the total product of all the States and Territories in 1870. Since that time there has

been a progressive decline in Nevada, where the product sank to \$15,031,621 in 1880, but a large increase in Colorado and Arizona. Utah has fallen off slightly, but Dakota more than makes up the deficiency, while the production of California remains at about the same figure which it has now maintained for some years.

The fluctuations in the product of the various States and Territories since 1877, the year of the largest production, may be seen from the following table, made up from the annual reports of Wells, Fargo & Co. :

STATES AND TERRITORIES.	1877.	1878.	1879.	1880.
California.....	\$18,174,716	\$18,920,461	\$18,190,978	\$18,276,166
Nevada.....	51,580,280	35,181,949	21,997,714	15,081,621
Oregon.....	1,191,997	1,218,794	1,087,961	1,050,641
Washington.....	92,226	73,811	85,836	105,164
Idaho.....	1,832,495	1,868,122	2,091,800	1,594,747
Montana.....	2,644,912	3,763,640	3,629,020	3,822,879
Utah.....	8,113,755	6,046,613	5,468,579	6,450,953
Colorado.....	7,913,549	6,232,747	14,413,515	21,284,989
New Mexico.....	379,010	453,813	622,500	711,300
Arizona.....	2,388,622	2,287,953	1,942,403	4,123,081
Dakota.....	1,500,000	2,215,804	3,205,957	4,472,471
Mexico.....	1,432,992	1,594,995	1,638,571	2,090,557
B. Columbia.....	1,177,160	1,283,460	976,742	844,867
Totals....	\$98,421,754	\$81,154,622	\$75,849,501	\$80,167,936

The decline in the product of Nevada, which amounts to \$36,548,679 as compared with 1877, is mainly due to the decreased product of the Comstock, which in 1880 yielded but \$5,312,592 as against \$37,911,710 in 1877, a falling off of \$32,509,118; but some of the other districts have also declined, as for instance the Eureka, which yielded \$4,649,025 in 1880 as against \$5,840,261 in 1879.

The production of gold in the United States in the fiscal year 1881 is estimated, by Director of the Mint Burchard, at \$36,500,000; that of silver, \$42,100,000. As the result of the inquiry into the consumption of the precious metals in the arts, the total use reported by manufacturers for the year 1881 was \$10,000,000 of gold and \$3,500,000 of silver; \$3,300,000 of the gold consumed was reported as United States coin remelted. The Assay Office in New York delivered to manufacturers \$5,700,000 worth of gold bars and \$5,100,000 in silver during the year. The consumption of gold and silver in arts and manufactures, if all reported, would likely, therefore, amount to at least \$11,000,000 in gold and \$6,000,000 in silver.

The total imports of gold during the year ending June 30th were \$100,031,259, against \$80,758,396 in 1880. Of this, \$7,577,422 was in American coin, against \$18,207,559 in 1880; \$61,454,918 was in foreign coin, and \$30,998,919 in bars, bullion, and dust. The gold exports were \$2,565,132. The silver imports were \$10,544,238, against \$12,275,914 in 1880. The silver exports were \$16,841,715, against \$13,503,894 in 1880. There was a net importation of gold of \$97,466,127, against \$77,119,371 in 1880; and a net exportation of silver of \$6,297,477, against \$1,227,980 the year before.

The net imports of specie amounted to \$91,168,650, against \$75,891,691 in the fiscal year 1880.

During the first six months of the year the stock and security markets exhibited an activity almost unparalleled. A veritable struggle among buyers for every investment of ascertainable value had given to the market a constant character of intense pressure and eager excitement, such as usually marks the sharp and brief crises in the game of stock speculation when operators are threatened with checkmate. The unprecedented production of the country for the two years previous, and the profitable disposal of a large surplus abroad, were the cause of the strong demand for investments. The earnings and profits of the people were so great an aggregate that the demand was in constant excess of the supply, and vast sums were invested at rates of interest 2 or 3 per cent lower than any which had ever before been accepted as permanent in America. The simultaneous redundancy of capital in London and Paris sustained the investment market; though the placing of great blocks of American stocks and bonds in the European market was no longer possible, for of dubious stocks the Europeans had grown wary, and on valuable investments the returns exceed but little the average interest in their own countries. The discrepancy was quite balanced by their comparative unfamiliarity with the conditions of the enterprises offered, and the certainty of occasional legal disputes and uncertainty of their issue.

As at all times when money is procurable, there were large fictitious dealings on the Stock Exchange. The ascending prices were discounted by speculators. The class who are in the habit of venturing money on their guesses as to the tendency of the market, were more numerous and better supplied with cash than usual. Yet the vast overplus of capital seeking investment, and the steady upward impulse of prices given by genuine competition, left less opportunity for the chancing of heavy wagers and for the finesse and strategy of the stock-gambling game than is afforded by a fluctuating market. The calling in and changing of United States bonds in the first half of the year flooded the market with money, and displaced a large amount of capital. This disturbance greatly augmented the demand, which without it would have been enormous, for permanent investments in property which does not call for the personal enterprise and supervision of the investor. The supply of desirable shares and securities, though outstripped by the demand, streamed into the market in an unprecedented volume. Companies which had years before ceased to divide any profits now began for the first time to return dividends, and their stock rose rapidly in the market. This class of scrip swelled the aggregate values in request with all the effect of a fresh supply. The fresh issues were hardly inferior in mag-

nitude. The season's railroad construction was progressing at the rate of thirty to fifty miles of track per diem, for which stocks and bonds were being issued at the daily rate of from \$1,200,000 to \$2,000,000. The capital actually absorbed in the work must have approached \$20,000 a mile. The promoters of railroad enterprise took advantage of the over-supply of the money market to obtain subscriptions for railroad construction a year and two years in advance. Scrip dividends to an immense aggregate amount were declared by established companies and newly amalgamated corporations, ostensibly based upon improvements made in the corporate property and additions made to it by the purchase of other properties or fresh extensions of their own and paid for out of recent earnings. The stock thus distributed was fed in large quantities into the market. Yet the whole vast influx of new and rehabilitated stocks and bonds did not stay the overflow of the money market, brought about by the national prosperity and by the extraordinary financial operations of the Government, the success of which is attributable to the same general cause. The prices of stocks rose higher and higher, and the market showed no signs of relapsing again to a lower level, although many capitalists refrained from purchasing, placing their money in the trust companies at 2 or 2½ per cent interest, in expectation of a decline. The calculations of the speculators were all at fault. The most venturesome sold out repeatedly, thinking the flood-mark was reached, only to buy in again at an advance, upon being convinced of the continued upward drift.

One incident occurred in February to disturb the smooth surface of the swelling tide of prosperity. This was the sudden and simultaneous action of the national bankers of New York city and of a number in other parts of the country in withdrawing gold and United States currency from circulation to deposit with the Government for the purpose of redeeming their bank currency. Proceeding thus in concert while the obnoxious 3 per cent funding act was awaiting the final action of the House of Representatives and the approval of the President, they brought Wall Street to the extreme verge of a money panic. The tone of the money market was only partially restored by an order of the Secretary of the Treasury for the redemption of \$25,000,000 of bonds on presentation. These bonds did not come in fast enough to afford much material relief, but the moral effect of the order was to allay anxiety and prevent serious embarrassments. About \$5,500,000 were purchased, and money flowed in from other sources after a week of severe strain. There were about \$18,000,000 of gold and legal tenders deposited by the national banks throughout the country, principally those of New York, to enable them to withdraw their bonds. The rate of money on call loans rose on the 25th to 1½ per cent a day commission in addition to the legal rates, from which point

it receded in five or six days to the normal low rates. Stocks fell heavily on the 25th, but recovered in a few days. From the time of this financial spasm until Secretary Windom formulated his refunding plan in April and the great Treasury transactions commenced, although an undertone of hope and confidence prevailed, the monetary situation changed day by day, with a tendency to improve, however. The real strength of the situation could not be brought out while money was still only moderately abundant and occasionally quite stringent. But when the Treasury began to pour out its accumulations, the tidal rise in values set in.

In midsummer various causes combined to produce a sharp decline in stocks. The superabundance of money was succeeded by dearth. In addition to the usual flow to the rural districts for harvesting purposes, great sums were drained to the West to maintain gigantic speculations in grain and provisions. The shooting of President Garfield, and the anxious doubts of his recovery, could not but strongly affect the most sensitive part of the commercial system. Exaggerated reports of failures in crops had a still more depressing influence on the stock market. A bitter war between the great trunk lines was equally potent with the last cause to disturb confidence in the values of railroad properties. Some of the most powerful operators in Wall Street were actively working at this time to bring prices down to a lower level. For three or four months the surplus in the New York banks oscillated about the 25 per cent minimum required by law, and several times sank below it. Money which had lately been freely supplied at from 2 to 4 per cent on call, was so scarce that high daily commissions were charged in times of greatest demand. The drain of money to the West continued until October. Upon the cessation of large disbursements by the Treasury, a great quantity of currency was abstracted from the circulation and accumulated on the hands of the Government. The only relief was given by large importations of gold, stimulated by the stringency of the money market. In October, at the critical moment, the immediate pressure was relieved by the action of the Treasury Department in redeeming a large amount of bonds before maturity. The inland requirements began at this time to abate, so that an easy money market again prevailed.

At the same time the tone of the stock market improved and prices began again to ascend. The underbidding of the through lines for the summer business was seen to have still left a profit. The shortage of crops was found to have been overestimated. The impression prevailed that the deficiency would not seriously harm the general prosperity, and would not have the effect of diminishing railroad earnings. The political fears and forebodings all vanished after the inauguration of President Arthur.

The Western Union Telegraph Company in the beginning of February took possession of

the property of the American Union, upon the dissolution of an injunction to prevent the consolidation of the two corporations. The Western Union stock was increased to \$80,000,000, \$22,473,500 of the \$38,000,000 increase being assigned the American Union stockholders, and \$15,526,500 being distributed as a dividend among the Western Union stockholders.

A syndicate, headed by Henry Villard, was organized for the purpose of acquiring a controlling interest in the Northern Pacific Railroad, in order to connect that line with the roads of the Oregon Railway and Navigation Company, and prevent its extension into Washington and Oregon as a competitive establishment. The passage of a law by the Legislature of Tennessee to pay the whole of its debt eventually while reducing the interest one half, was the signal for active speculation in the State bonds, which were in default, and had fallen to very low prices. In the spring, the Gowen project for bridging over the financial difficulties of the Reading Company, by issuing deferred bonds to meet the floating liabilities, was adjudged by the United States Circuit Court illegal and contrary to the charter. Mr. Gowen was finally supplanted in the management about the same time through the efforts of the Messrs. McCalmont. The affairs of the elevated railroad companies of New York were in an embarrassed condition, and the lessee company, being unable to meet the fixed charges, prayed for a remission of taxes. The Attorney-General threatened to dissolve the company by authority of the State; but refrained, and the concern was placed in the hands of a receiver. Toward the close of the year a consolidation of the three companies was effected.

The condition of the markets in July was particularly favorable to speculative schemes. The intermittent and frequently stringent state of the money market and the oversold stock market, which had been depleted of its usual stock of floating securities by the purchases of investors, enabled cliques of operators to control the supply of money or of special lines of stock; while the above-described elements of doubt, amid the general flourishing outlook, permitted them to play upon the hopes or the fears of the speculating and investing public. A general and heavy decline in all but the highest class of securities, which initiated the speculative phase, was precipitated by the active co-operation of the great manipulators of values. A curious episode of this period was a slyly effected corner in Hannibal and St. Joseph common stock, a third-class property, by which some of the magnates of the market were forced to pay many times the value of the stock for which they stood engaged. The war between the trunk lines, which was waged by the competitive lowering of passenger and freight rates between Eastern and Western termini, was supposed to have had for its motive the desire on the part of the manager of the New York Central and its continuations, Will-

iam H. Vanderbilt, to obtain the revocation of the conditions of the pool entered into between the through lines, which fix the charges for freight on the roads terminating at Baltimore and Philadelphia too low to afford a maximum of business and profit to the New York Central road, and which draw to those cities a portion of the foreign commerce which would go to New York under the desired rearrangement of the covenanted tariff. The competition of the water-route was sufficient, however, to warrant the reduction of freight rates, great as it was, if it did not first prompt it; for the reports of the roads show an actual increase of the net profits over the previous year. The New York Central company demonstrated its remarkable economical strength, but did not accomplish the object of compelling the other lines to enter into a new compact. The contest could not be continued when, toward the time for closing the canals, business so increased as to tax all the roads to their full capacity. About the end of October one road after the other set up the old schedule of prices, and all had more custom than they could attend to.

At the rates ruling in the early part of the year for the new Government bonds, the interest received by investors is not above 3 per cent per annum. Of railroad bonds, ten of the larger loans of the highest standing netted from $4\frac{1}{2}$ down to $3\frac{1}{2}$ per cent annual interest, and averaged only 4.20 per cent, calculated on the prices ruling in April, with deduction of the loss of premium on maturity. The majority of bonds, however, gave better returns, the average net rate of interest on all classes standing at or above par being about $5\frac{1}{2}$ per cent, including those of many enterprises whose future was not yet assured. States and cities whose credit was sound, issued no new bonds bearing a higher rate of interest than 4 per cent, and at that rate they usually commanded a premium. The rise in the selling value of forty-seven prominent stocks of the par value of \$964,000,000 was between July 1, 1879, and July 1, 1881, from \$643,000,000 to \$1,166,000,000, or over 81 per cent in two years.

Railroad enterprises, as usual, engrossed the main bulk of the capital offered for investment. Railroads are the most important of the tools which enable the agricultural resources of the country to be utilized with commercial advantage. As the development of the country is now mainly in this direction, and as the foreign demand for agricultural products enables every newly opened district of rich land to be tilled with profit, railroads yield surer and larger returns than almost any other species of property into which accumulated savings can be placed. At the beginning of the year there were upward of \$5,000,000,000 of railroad securities of all sorts outstanding. The favorable reports of railroad business furnished good grounds for the growing confidence in this species of property and the strong demand

for railroad securities, which began early in the year and supported an unprecedented expansion of the total volume of values. Severe snow blockades, a large falling off of the corn and wheat traffic compared with 1880, and freshets in the early spring, coupled with the critical condition of the money market, caused fluctuations in the first quarter of the year. When it was found that the railroads were taking in more money than the year before, that passenger traffic and miscellaneous freight showed a remarkable increase, the confidence in the future became general. For the first three months the gross earnings upon a mileage 15 per cent greater were over 9 per cent in excess of those of the same part of 1880. In April the receipts of wheat and corn began to exceed those of the previous year, and the railroads reported 25 per cent greater earnings than in the April of 1880.

Between the 1st of January and the 1st of September the total amount of stocks and bonds for the construction of new lines or branches of railroad or of telegraphs amounted to \$390,312,200. The cash payments undertaken by the subscribers, extending through

the year and through a good part of 1882 in the cases of some of the heavier loans, amount in all to \$234,683,000. Besides these issues placed upon the market there were others, amounting to at least 15 per cent in addition, which were subscribed privately by large companies for the construction of tributary lines. For improvements, purchase of other roads, and on consolidations, \$243,684,200 of stocks and bonds were issued, calling for an estimated amount of \$155,194,200 in cash. The aggregate cash requirements of the new issues for the first eight months of the year were thus \$389,877,200, covering the remainder of the season and a portion of the next. There were issued in addition, in the form of stock dividends or otherwise, \$26,933,700 of stocks and bonds which called for no cash payments. The grand total of the financial adventures in extending and improving the means of intercommunication taken up in the market during the first eight months of the year amounted to \$389,877,200 in engagements for cash payments, and \$660,930,100 in certificates of indebtedness and ownership given therefor, divided as follows:

ISSUED TO SEPTEMBER 1, 1881.	Mortgage bonds.	Income bonds.	Stock.
For construction of new road.....	\$221,183,000	\$25,759,200	\$143,370,000
For improvements, for purchase of other roads, or on consolidation.....	75,169,000	21,500,000	147,015,200
Without valuable consideration.....	4,225,000	22,708,700
Grand total.....	\$296,352,000	\$51,484,200	\$313,098,900

Of the subscriptions for the construction of new roads, the mortgage bonds were sold at or near par, and called for full value in cash. The income bonds and stock were added as a bonus, except \$13,500,000 cash subscriptions for stock. The amount of cash capital provided for new lines and extensions is therefore \$234,683,000. For the increase of stocks and bonds issued on consolidation, some \$155,194,200, as recited above, are payable. The third class represents improvements made out of surplus earnings or a higher capitalization for political reasons, and asks for no cash contributions. Some of the largest of the new issues of stocks and bonds for railroad and telegraph construction were as follows: \$16,000,000 of mortgage bonds and an equal amount of stock issued by the New York, Chicago and St. Louis company, and taken by a syndicate for the construction of road between Buffalo and Chicago; \$20,000,000 of Northern Pacific bonds for extensions which will bring the mileage of the road up to 2,600 miles; \$12,200,000 of bonds and half that amount of stock of the Oregon Short Line, a spur of the Union Pacific to run into the State of Oregon, length 600 miles; \$15,000,000 of bonds and stock to an equal amount of the New York, West Shore, and Buffalo road, which will join the projected line up the west bank of the Hudson; \$5,000,000 of mortgage bonds, \$5,000,000 of income bonds,

and \$6,250,000 of stock for the new division of the Richmond, Alleghany and Ohio consolidated railroads; \$6,000,000 of bonds and the same amount of stock of the new Georgia Pacific line from Atlanta to the Mississippi River; \$3,000,000 of bonds and \$6,000,000 of stock to extend the Denver and Rio Grande narrow-gauge line; \$6,000,000 of bonds and \$3,000,000 of stock to complete the Denver and Rio Grande system; \$5,000,000 of bonds, accompanied by stock of the same amount, of the Texas and Pacific Railroad building from Fort Worth to El Paso; \$3,000,000 of bonds, and the same amount of stock for the New Orleans Pacific, a combination of the above from Shreveport to New Orleans; about \$6,250,000 of bonds and \$12,500,000 of stock to carry on the construction of the Southern Pacific; \$7,500,000 of bonds and stock to the same amount to construct the Mexican National Railway, for which the Palmer-Sullivan concession was granted; \$5,715,000 of mortgage bonds, \$1,139,200 of income bonds, and \$4,572,000 of stock of the Mexican Central, for which a Boston syndicate secured concessions; \$10,000,000 of mortgage bonds and \$7,000,000 of income bonds of the Atlantic and Pacific line to be built from Albuquerque to the Pacific coast, about 600 miles; \$5,000,000 of stock, with bonds of the same amount given as a bonus, to construct new lines of the Mutual Union Tele-

graph Company; and \$10,000,000 nominal capital of the Cable Construction Company to lay two new Atlantic cables.

The largest amounts of new stock and securities issued for improvements and to effect consolidations, not including the huge amounts issued on reorganization in lieu of the existing obligations of the merged lines, were as follows: \$14,492,000 of mortgage bonds, \$16,500,000 of income bonds, and \$39,000,000 of stock representing the addition by purchase and construction of 850 miles to the 1,123 miles of road owned or being built by the East Tennessee, Virginia and Georgia company; \$10,000,000 of bonds and \$2,000,000 of stock for new lines acquired by the Wabash, St. Louis and Pacific company; \$30,000,000 of stock of the Oregon Transcontinental company, which has expended \$16,000,000 in purchasing an interest in the Northern Pacific road; \$5,000,000 of income bonds and \$22,500,000 of stock of the Alabama, New Orleans, Texas, and Pacific Junction, offered in London; \$7,000,000 of mortgage bonds for improvements and acquisitions of the Louisville and Nashville Railroad; \$7,600,000 increase of stock of the Ohio Central company; \$10,237,700 of new stock issued to stockholders of the Union Pacific Railroad for extensions and betterments; \$6,000,000 of stock for additions to the property of the Oregon Railway and Navigation Company; \$10,000,000 of bonds issued by the Pennsylvania company for the purchase of leased roads; \$10,000,000 of 4 per cent bonds issued by the Pennsylvania Railroad Company for the purchase of the Philadelphia, Wilmington and Baltimore line; \$4,000,000 of bonds and \$5,000,000 of stock of the Chicago, Milwaukee and St. Paul company.

The largest issues of dividends in stock, certificates, and bonds, and increased allotments of stock to shareholders on reorganization, were an increase of \$13,000,000 in the stock of the roads consolidated into the Columbus, Hocking Valley and Toledo; \$4,225,008 of loan certificates issued to old stockholders by the Georgia Central company; and \$15,526,500 of stock issued to former holders of Western Union Telegraph stock upon the absorption of the American Union lines.

The extent of new railroad definitely undertaken and destined to be completed before the end of 1882, was 15,886 miles. For the construction of that amount of new track within fifteen months, engagements were known to have been entered into before October 1, 1881. This does not include the roads projected but not yet subscribed for, nor those for which the means were provided and the plans matured, which had not been advertised to the public. Of the prospective extensions, 4,791 miles were to be built east of the Mississippi River and north of the Potomac and Ohio Rivers; 2,352 miles east of the Mississippi and south of those two rivers; 4,063 miles west of the Mississippi and north of the latitude of St. Louis; 4,140

miles west of the Mississippi and south of that line; and 540 miles on the west side of the Rocky Mountains.

Railroads require for construction an expenditure of about \$20,000 per mile. Counting equipment and other expenses, they actually absorb about \$25,000 per mile of new line. The railroads undertaken, as estimated above, reduce therefore about \$397,000,000 of floating capital to this form of fixed capital. As new enterprises of the same sort were being matured with the same frequency during the remaining months of the year, that sum represents only a part of the aggregate capital provided for railroad extension in 1881 and 1882. A considerable part of the railroad-building of the earlier part of 1881 was done with money engaged for the purpose in 1880. The advance subscriptions for railroads to be constructed in the ensuing year were vastly heavier in 1881. Six new through or connecting lines have been projected between the Atlantic coast and the West, two of which are to be completed before the end of 1882, and all of them before 1884. The capital for these routes has nearly all of it been raised by private subscriptions of capitalists. The New York, Chicago and St. Louis road is being put down rapidly between Chicago and Buffalo. The Chicago and Atlantic is to connect with the Erie and Pennsylvania Railroads at Marion, Ohio. The New York, West Shore and Buffalo road is to run from Buffalo to Schenectady, and thence along the right bank of the North River, terminating opposite New York at Weehawken. The Boston, Hoosac Tunnel and Western follows a straight route from Boston to Buffalo. The New York, Lackawanna and Western runs parallel to the Erie road, and connects New York with Buffalo *via* the Delaware, Lackawanna and Western. The New York, Pittsburg and Chicago is to use the Central of New Jersey and its connecting lines in Pennsylvania, and to reach Chicago by the new Chicago and Atlantic Railroad.

The result of the railroad war, which strongly affected the stock market, was that the gross earnings of the five trunk lines were \$126,500,000, against \$121,000,000 in 1880; the net earnings \$48,250,000, against \$51,500,000.

In the autumn of 1878, just previous to the resumption of specie payments, the first signs of a revival in business appeared. Prices then stood at a lower figure than had been known for forty years. Since that date there has been a continuous general rise in values. In a table printed below are given the New York wholesale prices for the staple articles of American commerce on or about the 1st of November for 1878, and each succeeding year. A computation based on those prices, and the quantities of the different commodities entering into consumption or into commerce, gives the following comparative estimate of the general rise in values, and its proportional distribution among the main classes of commodities:

ARTICLES OF	1878.	1879.	1880.	1881.
Food.....	\$62 55	\$76 47	\$75 56	\$92 01
Clothing.....	27 57	33 19	33 88	33 96
Iron, etc.....	20 57	25 95	26 43	25 69
Lumber, etc.....	12 55	18 96	19 91	16 19
Total.....	\$123 07	\$149 57	\$155 91	\$167 85

The average effect was thus a mean advance of 21·54 per cent in November, 1879, on the prices of 1878; of 4·2 per cent in 1880 on the prices current in November, 1879; and of 7·65 per cent in 1881 on the prices of 1880. The rise in the general average of prices between 1878 and 1881 was 36·4 per cent. The mean rise in articles of food is seen to have been nearly 50 per cent, in other classes of articles about 25 per cent. The quotations for staple articles in the New York markets in the first week of November, on which the above computation is based, were, for the four years to which we have alluded above, as shown in the following table:

ARTICLES.	1878.	1879.	1880.	1881.
Wheat, No. 2 red winter, bush.....	\$1 01	\$1 41	\$1 17½	\$1 44½
Corn, No. 2 mixed, bushel.....	46½	60½	56	69
Oats, No. 2 mixed, bushel.....	28½	41	39	47

Soda-ash.....	1 65	1 70	1 55	1 45

Prices are about 10 per cent higher than in 1860, while in 1878 they were about 18½ per cent lower. The purchasing power of \$100 in 1860 is estimated to have been equal to that of \$78 in 1843, \$126 in 1837, and \$111 in 1825. The sums equivalent to \$100 in 1860 for each year since the civil war have been calculated as follows:

YEAR.	Currency.	Gold.
1864.....	\$225 00	\$125 00
1865.....	184 00	127 00
1866.....	167 00	131 00
1867.....	189 00	138 00
1868.....	195 00	140 00
1869.....	156 00	116 00
1870.....	136 00	113 00
1871.....	134 00	120 00
1872.....	138 00	122 00
1873.....	132 00	113 00

Of the churches, 2,800 were returned as "with pastors," 945 as "vacant"; of the ministers, 2,412 as "in pastoral work," 1,165 as "not in pastoral work." Number of licentiates, additional to "ministers," 224. Number of additions by profession of faith during the year, 12,230; number of baptisms, 5,893 of adults, 4,989 of infants; number of families

connected with the churches, 187,617; number of persons connected with Sunday-schools, 444,628. Total amount of benevolent contributions from 2,896 churches reporting them, \$1,032,272; amount of contributions for home expenditure from 2,613 churches reporting, \$3,446,489.

The seven theological seminaries (Andover, Andover, Massachusetts; Bangor, Bangor, Maine; Chicago, Chicago, Illinois; Hartford, Hartford, Connecticut; Oberlin, Oberlin, Ohio; Pacific, Oakland, California; and Yale, New Haven, Connecticut) returned altogether, 36 professors, 19 lecturers, and 279 students.

According to the tables given in their "Year Book" for 1881-'82, the Congregationalists of the *Dominion of Canada* have 91 churches with 51 pastors, 28 assemblies not churches, 84 preaching-stations, an average attendance on worship of 13,210 persons, with a total of 17,627 persons under pastoral care, 5,653 church-members, and 6,753 Sunday-school scholars.

The "Year-Book" of the *Congregational Churches of England and Wales* for 1881 gives lists of 4,188 churches and 2,723 pastors, lay pastors, and evangelists. Seventy-five ministers had been ordained during the year. Eighteen ministers left the denomination, and as many had been received from other churches.

I. CONGREGATIONALISTS IN THE UNITED STATES.—The working capital of the *American Congregational Union* for the year ending May 1, 1881, was \$55,359. The society had made grants and loans (mostly grants) to 71 churches. During the twenty-eight years of its existence, the Union had aided in the erection of 1,120 houses of worship, and it was now pledged to sixty additional ones.

The fifty-fifth annual meeting of the *American Home Missionary Society* was held in the city of New York, May 8th. The receipts of the society for the year had been \$290,953, and its expenditures \$284,414. It sustained missions in thirty-four States and Territories, employing 1,032 missionaries, who served 2,653 preaching-places. Five of the missionaries were commissioned to congregations composed of colored people, and twenty-six to congregations of foreign nationalities, chiefly of Welsh. The number of pupils in Sunday-schools was 99,898. Seventeen more missionaries were employed than during the previous year, and 131 churches had been founded.

A committee appointed to consider the subject of amending the constitution of the society has made a report proposing certain provisions for securing its constant control by influences favorable to the "evangelical" side of religious belief. The society was founded as an undenominational agency to assist congregations unable to support a minister, and to send the gospel to destitute places, and was supported for many years jointly by Congregationalists and Presbyterians. The Presbyterians having formed their own societies, it was left in the hands of the Congregationalists, who, however,

exercised no direct control over it as such. The committee recommended that the articles defining the object of the society be amended by the insertion of the words "but no minister or teacher shall be employed by this society who is not in regular standing in some Protestant evangelical church," and that the several State Congregational bodies be given the right to nominate, according to their membership, one or more directors, to be chosen by the society at its annual meeting. The committee also proposed that the Board of Directors thus chosen, besides selecting the Executive Committee of fourteen, as now, be also given authority to name the secretary and treasurer of the society.

The thirty-fifth annual meeting of the *American Missionary Association* was held at Worcester, Massachusetts, November 1st, 2d, and 3d. The total ordinary receipts of the association for the year had been \$243,795, or \$56,315 more than the receipts of the previous year. Besides this amount, the following sums had been received by institutions in which the association has an interest: Berea College, \$60,106; Hampton Normal and Agricultural Institute, \$102,579; Atlanta University (appropriation from the State of Georgia), \$8,000—making, with \$114,563 received for endowment and special funds, the total receipts for the work in which the association is engaged, \$529,046.

The association conducts missions and schools among the freedmen in the Southern States; at the Mendi mission on the west coast of Africa; among the Indians at the Skokomish agency; and among the Chinese on the Pacific coast of the United States. Its work among the freedmen included, according to the report for the past year, eight chartered institutions, and forty-six normal and common schools, with 230 teachers and 9,108 students, and 78 churches, with 5,472 church-members and 8,130 persons in Sunday-schools. The pupils in the schools were classified as follows: theological, 104; law, 20; collegiate, 91; collegiate preparatory, 131; normal, 2,342; grammar, 473; intermediate, 2,722; primary, 3,361; studying in two grades, 136. Seven State Conferences, holding annual conventions, had been organized among the freedmen's churches. Eleven missionaries had been commissioned to labor in the homes of the poor and destitute colored people. The Mendi mission, in West Africa, comprised a church and school, which had been well kept up, a coffee-farm that promised to make a good return, and a profitable saw-mill. Three lads from the Mendi country were at school in the United States. Commissioners had been dispatched to arrange for the establishment of a mission on the Upper Nile, near the mouth of the Sobat, in aid of which \$30,000 were expected from English friends of the work, conditioned upon the association providing \$20,000 more. The two churches among the Indians enjoyed an average attend-

ance of about one hundred and twenty persons in the congregations, and had contributed \$614 to benevolent objects. Indian youth under the tutelage of the society were attending school at the Hampton Institute, Virginia, and at Carlisle, Pennsylvania, and the Executive Committee was contemplating the provision of accommodations for Indian youth in connection with other institutions. Sixteen hundred and thirty-two pupils were enrolled in the schools for the Chinese on the Pacific coast of the United States.

The seventy-second annual meeting of the *American Board of Commissioners for Foreign Missions* was held at St. Louis, Missouri, October 18th. The ordinary receipts of the board for the year had been \$451,214, and the appropriations, including provision to meet the deficit of the previous year, had been \$453,273; and the Prudential Committee was able to report, for the first time for several years, that the current annual expenses had been met by the current annual receipts; it also reported that the deficit at the beginning of the year, of more than \$14,000, had been reduced to \$2,059. Nine missionaries and thirty-one assistant missionaries had been added to the roll of the laborers of the board. The reports from the mission-fields included accounts of the progress of the work of evangelization in Africa (Zooloos), the Turkish Empire (European Turkey, Asia Minor, and Armenia), India, Ceylon, China, Japan, Micronesia, among the North American Indians, in Mexico, Spain, and the Austrian Empire. The report named, as events worthy of especial mention, the establishment of a new mission in Bihé, Central Africa; the advance in the higher Christian education in the Turkish Empire and in India; the success which had attended the work of the women "in nearly every mission-field"; and the illustration of the value of the boarding-schools in the development of Christian character.

Missions.—Number of missions, 17; number of stations, 81; number of out-stations, 733.

Laborers employed.—Number of ordained missionaries (5 being physicians), 159; number of physicians not ordained, men and women, 11; number of other male assistants, 10; number of female assistants, 253; whole number of laborers sent from the United States, 433. Number of native pastors, 141; number of native preachers and catechists, 365; number of native school-teachers, 1,005; number of other native helpers, 206. Whole number of laborers connected with the missions, 2,131.

The Press.—Pages printed, as far as reported (Turkish, Japan, North China, Zooloo, and India missions), 25,000,000.

The Churches.—Number of churches, 272; number of church-members, as nearly as can be learned, 18,446; added during the year, as nearly as can be learned, with additions not previously reported, 2,161.

Educational Department.—Number of training, theological schools, and station-classes, 51; number of pupils in the above, 1,468; number of boarding-schools for girls, 36; number of pupils in boarding-schools for girls, 1,420; number of common schools, 791; number of pupils in common schools, 30,472; whole number of pupils, 33,360.

The National Congregational Council of 1880 appointed a committee to which it intrusted the duty of selecting a commission of twenty-five persons to consider the matter of preparing a new *Creed and Catechism* for the Congregational churches. This committee, in June, 1881, announced the appointment of the following persons as members of the commission:

Rev. Julius H. Seelye, D. D., Amherst, Mass.
 Rev. Charles M. Mead, D. D., Andover, Mass.
 Rev. Henry M. Dexter, D. D., Boston, Mass.
 Rev. Edmund K. Alden, D. D., Boston, Mass.
 Rev. Alexander McKenzie, D. D., Cambridge, Mass.
 Rev. Samuel Harris, D. D., New Haven, Conn.
 Rev. George P. Fisher, D. D., New Haven, Conn.
 Rev. George L. Walker, D. D., Hartford, Conn.
 Rev. William S. Karr, D. D., Hartford, Conn.
 Prof. George T. Ladd, Brunswick, Me.
 Rev. Samuel P. Leeds, D. D., Hanover, N. H.
 Rev. David B. Coe, D. D., New York, N. Y.
 Rev. William M. Taylor, D. D., New York, N. Y.
 Rev. Lyman Abbott, D. D., Cornwall-on-the-Hudson, N. Y.
 Rev. Augustus F. Beard, D. D., Syracuse, N. Y.
 Rev. William W. Patton, D. D., Washington, D. C.
 Rev. James H. Fairchild, D. D., Oberlin, O.
 Rev. Israel W. Andrews, D. D., Marietta, O.
 Rev. Zachary Eddy, D. D., Detroit, Mich.
 Rev. James T. Hyde, D. D., Chicago, Ill.
 Rev. Edward P. Goodwin, D. D., Chicago, Ill.
 Rev. Alden B. Robbins, D. D., Muscatine, Ia.
 Rev. Constans L. Goodell, D. D., St. Louis, Mo.
 Rev. Richard Cordley, D. D., Emporia, Kan.
 Rev. George Moor, D. D., Oakland, Cal.

In announcing the appointments, the committee stated that, in making the selection, different sections of the country had been drawn upon somewhat in proportion to the membership in the Congregational churches in each. The list embraced men who were understood to represent different shades of opinion, while holding fast to the essential doctrines of the gospel. With a large proportion of pastors were joined representatives of theological seminaries and colleges, of the religious press, and of the missionary work of the churches.

The commission met at Syracuse, New York, September 28th; Professor Julius H. Seelye, of Amherst College, presided. The work assigned to the body was considered, and a plan of operations was adopted. The commission was divided into three committees, namely: a committee on the larger confession of faith, President James H. Fairchild, of Oberlin College, chairman; a committee on the smaller statement of belief, Rev. Dr. E. P. Goodwin, of Chicago, chairman; and a committee on the catechism, Rev. Dr. Alexander McKenzie, of Cambridge, chairman. The reports of the committees are to be made to the full commission, to be called together before July 15, 1882.

II. CONGREGATIONALISTS OF ENGLAND AND WALES.—The forty-ninth annual meeting of the *Congregational Union of England and Wales* was held in London, May 9th. The Rev. Dr. Allon presided, and delivered an inaugural address on the subject of "Congregationalism," treating the subject with especial reference to the approaching jubilee of the Union. He showed that of the eighty-two million persons constituting the religious denominations of the English-speaking world, twenty-five millions, including the Baptist churches, held to the Congregational, thirty-two million Anglicans and Roman Catholics to the Episcopal, and twenty-five million Presbyterians and Methodists to the Presbyterian form of government. He believed that the New Testament laid down no principle, injunction, or precedent concerning church government, but that the validity of the congregational church life could be justified by an appeal to the congregationalism of the earliest Christian communities. Referring to the history of the Union, the speaker remarked that it had given birth to evangelizing agencies of various kinds which had nearly doubled the forces of English congregationalism during the last fifty years. Since 1838, the number of chapels had increased from 1,879 to 3,102, with 1,081 preaching-stations; of hearers, from 563,200 to 962,100; and of communicants from 169,110 to 313,807. The committee on the special jubilee fund reported that it had decided to recommend two objects, viz., the Church Aid Society, and the project for liquidating church debts, which were stated to amount, in the aggregate, to half a million pounds sterling. These propositions were unanimously approved. A resolution was passed recommending "a godly, scriptural discipline, both in the admission of members and in the rebuke or exclusion of the unworthy." The Rev. J. A. Macfadyen, of Manchester, was elected president of the Union for the next year.

The fiftieth anniversary of the organization of the Union was celebrated at the autumnal meeting, which was held in Manchester, beginning October 4th. A large deputation was in attendance from the United States, and delegates were also present from Canada, Ireland, Scotland, Africa, and Australia. The opening address of the president, Dr. Allon, was on "The Church of the Future," and embodied an argument to show that the "future will be with the church that has in it the greatest moral forces," those being declared the greatest moral forces which most powerfully affect the "conscience and the religious heart of man." The Rev. Dr. Stoughton read a paper also at the opening meeting on "Reminiscences of Congregationalism Fifty Years ago." A committee which had been appointed to raise a jubilee fund reported that it had obtained subscriptions to the amount of £50,179. Lectures on the history and condition of Congregationalism were contemplated in aid of the

enterprise. The fund was intended to remove the load of debt under which many of the churches were suffering, and to supplement the pay of ministers, but the institution of a system of permanent endowment was not contemplated. The subscriptions would be spread over three or five years, at the end of which time it was expected that the income of the churches would be permanently and voluntarily increased.

The eighty-seventh annual meeting of the *London Missionary Society* was held in London, May 12th. The Earl of Aberdeen presided. The receipts of the society during the year from all sources had amounted to £108,247, and the expenditures to £111,659. The report of the foreign secretary contained a general comparative review of the operations of the society during the last ten years. The number of European missionaries had been reduced from 175 in 1867 and 160 in 1871 to 139, but the reduction had not been attended with a corresponding contraction in the sphere of labor of the society, for the principle of self-support had been extended. Ten churches in South Africa and eleven churches in the West Indies had become independent during the last ten years. The number of native laborers had also largely increased to a degree represented by the return of 371 native ordained pastors in 1880 to 106 in 1870, of 4,529 native preachers in 1880 to 1,644 in 1870, besides a considerable increase among the independent churches of the West Indies and the Cape Colony. New missions had been begun in Central Africa and New Guinea, which employed twelve missionaries. Training institutes were in successful operation in the South-Sea Islands, Madagascar (Antananarivo College), and in South Africa (Moffat Institute). Fourteen women missionaries additional to wives of missionaries had been sent out since 1876, of whom eleven were still engaged in work. The most successful work had been accomplished in Madagascar and the South-Sea Islands, and substantial progress had been made in India and China. The Rev. Ralph Wardlaw Thompson entered upon the office of foreign secretary of the society in January, 1881, in place of the Rev. Dr. Mullens, deceased.

III. FREE CHURCHES OF FRANCE.—The Synod of the Union of *Free Evangelical Churches of France* met in Paris, November 10th. Dr. E. de Pressensé was chosen president. The Synodal Commission reported the present number of members to be 3,139, or 88 less than were returned at the previous synod. Three pastors had left the synod for the Reformed Church, while the synod had received three pastors from abroad and had ordained six new ones. The total contributions of the churches had been 55,389 francs, besides which the synod had received 30,180 francs from abroad. The Commission for Evangelization had received 96,606 francs, and maintained thirteen stations, which were supplied by fourteen agents.

CONGRESS, UNITED STATES. The third session of the Forty-sixth Congress commenced at Washington on December 6, 1880, and closed on March 4, 1881. The Vice-President of the United States took the chair in the Senate, and Samuel J. Randall, of Pennsylvania, the Speaker, presided in the House. (For the President's message, Rutherford B. Hayes, see "Public Documents," in ANNUAL CYCLOPEDIA, 1880.)

In the Senate, on January 12th, Senator Logan, of Illinois, introduced the following joint resolution:

Resolved, etc., That the franking privilege is hereby extended to all official business sent through the mails by Senators, Representatives, and Delegates in Congress; in all other respects to be under the restrictions and limitations of existing law.

Mr. Davis, of West Virginia: "I have no objection to the joint resolution being taken up, but it occurs to me the Senator had better let it go to the Committee on Post-Offices and Post-Roads. There may be further privileges which ought to be given. I do not know whether the joint resolution embraces all the privileges that ought to be granted or not. I am with the Senator in what he now asks, but it is highly probable that the joint resolution ought

to be considered by the committee, and a report made on it."

Mr. Logan: "A matter of this kind certainly every Senator in the Chamber is just as familiar with as the Committee on Post-Offices and Post-Roads. This is a mere resolution authorizing Senators and Representatives and Delegates to frank official letters sent to their constituents by them. That is what it embraces. How can the committee give any more information on it than there is in the resolution?"

Mr. Davis, of West Virginia: "I appeal to the Senator to allow the reference to be made; but if he prefers not, I reckon we had just as well take a test vote on it, and therefore I move that the joint resolution be referred to the Committee on Post-Offices and Post-Roads."

Mr. Logan: "I move, as an amendment to that motion, that the committee be instructed to report back immediately."

Mr. Conkling, of New York: "I have no objection to a reference of this resolution to the Committee on Post-Offices and Post-Roads; but if it is to be referred I agree with the Senator from Illinois that it should be with a direction of the Senate that it shall come back presently, a direction which I can not doubt is proper; and I say that for this reason: the whole question is whether we want the legislation of Congress to so continue that every clerk in a post-office, every clerk in a department from the head clerk of that department down, may send through the mails matters of public business, while at the same time the members of this body and of the House of Representatives shall be compelled to defray each from his own pocket the great volume of postage which is borne upon communications coming from the soldiers, the sailors, the widows, the beneficiaries under the pension acts, and other persons who send letters not touching our business but their business. That is the whole question."

Mr. Edmunds, of Vermont: "I think that the idea in a republic like ours that the representatives of the people are to be taxed for communicating with them about any matter of public concern, whether you call it official business or political business, is wrong. I believe the more you can encourage the people by carrying their letters and communications to members of Congress from and upon all possible subjects, the more good you do to republican government and the dissemination of intelligence upon which it rests. Therefore I have always voted against the abolition of the franking privilege, so called, and always voted in favor of its restoration, and I mean to do it again. We all understand how this notion of abolishing it got up. A few great city papers started it because they thought they would increase their circulation by cutting off as far as possible communication between Members and Senators at the capital and distant parts of the country; and it is a

strange thing, as the Senator from New York has said, that year after year by our own laws we have declared that the only public servants not fit to be trusted in communicating with the people about public affairs are Senators and Representatives. A head of department, any of the department clerks, everybody in the executive service of the country is thought worthy to be trusted to communicate concerning public affairs with everybody else through the advantage of the mails, it costing the United States nothing to carry the free communications except on a very few routes. It is true that the postage that you would force Senators and Members and citizens to pay, and which otherwise they would not pay, is so much loss to the accumulated taxation of the people. That is true; but I think that every cent that you lose in allowing a citizen to send to any Senator a letter on any subject of public concern—and we all know that ninety-nine hundredths of these letters are about subjects of public concern—is ten thousand times counterbalanced by the advantage that there is to a country constituted like ours in this absolutely free intercommunication. Therefore I am not afraid of the opinions of my constituents or anybody else on such a subject. The present course of procedure is very unjust to Senators and Members. Every chairman of a committee in respect of the absolute performance of his duties is taxed day by day. When I had the honor to be chairman of the Committee on the Judiciary, I found that I was taxed to the extent of several dollars a week, and I have no doubt my friend from Ohio [Mr. Thurman] is now to a large sum, in paying postage in respect to matters that we had no more individual concern in than a resident of France, but that the public had concern in. I am in favor of this reference and for an immediate report, in order that the committee may consider whether they shall not extend this right—I would not call it a privilege; rather a right and a duty—to all the correspondents of Senators and members of Congress; or if they think it unfit to do that, to be careful to define the word 'official' in some way, so that we can honorably and honestly understand it all alike as to what is covered by what is called 'official business' of Senators. I do not know precisely what that would mean."

Mr. Eaton, of Connecticut: "Mr. President, I have no doubt about the propriety of this resolution. I have been paying postage, as my friend from Vermont says he has been. I have done it to-day and every other day, as well as I can remember, for a long time past; but after the remarks which have been made here, is there any necessity to instruct the committee? In my judgment the committee will report as speedily as possible."

Mr. Thurman, of Ohio: "Mr. President, I have a little delicacy in speaking on this subject. My political life is so nearly at an end that it might be supposed I was interfering

with those who are to remain here. But I can not forbear making a remark.

"The franking privilege was taken away because it was so flagrantly abused. If there had never been any abuse of that privilege, it never would have been taken away. It was really misnamed a privilege; that is, in the sense of being a privilege of the members of Congress. It was the privilege of the people far more than of any member of Congress. It enabled the people to receive what they otherwise would not have received, in the form of documents and other information of the workings and doings of the Government. It was the people's privilege, and not the privilege of the members of Congress. But it was flagrantly abused, and when I say that I speak with some knowledge on the subject—and do not let anybody suppose that I am going to make a confession, for I am not conscious that I ever did abuse it myself—but it was so flagrantly abused that there was a demand, and I believe both political parties had a sort of struggle with each other who could go the farthest in advocating the repeal of that privilege.

"Some years ago (I will not say what year it was, but it was the year of a presidential election) I was passing, in the recess of Congress, through one of the corridors of this Capitol, and seeing three or four hundred people at work, sending off all sorts of matter, I asked a friend of mine, the chairman of the committee under whom these men were working, 'Won't you give me one of those bundles that you have put up there, and let me see what kind of food you are sending off to the people?' 'Why, certainly,' said he, and he told one of them, 'Give Mr. Thurman one of those bundles.' He gave it to me and I have it yet, and I could show that it contained not one single line of frankable matter; and furthermore, that in the case of one man whose frank appeared upon it, it was written in four different handwritings, showing that four different clerks had been writing that man's name, and that man, as I know, was not less than five hundred miles from this Capitol at that time."

Mr. Logan: "At the time the law was repealed, it was done at the dictation of a few newspapers of the country and of a Postmaster-General, who sent out instructions to every postmaster in the United States to have a petition signed and sent to Congress to repeal the law, and the postmasters were instructed to get names to these petitions. That was the way it came to be stricken from the statute-book, and it was not for the reason assigned by the Senator from Ohio."

Mr. Thurman: "Has the Senator never heard of the speech of a distinguished member of the Government made to his constituents, a political speech?"

Mr. Logan: "I have heard of many of that kind."

Mr. Thurman: "Of one that was sent, as it was stated in the newspapers, by thousands

and hundreds of thousands under the official frank of a department?"

Mr. Logan: "What has that got to do with official communications from the departments?"

Mr. Thurman: "I should say that was an abuse of the privilege."

Mr. Conkling: "That was under the law as it stands now."

Mr. Garland, of Arkansas: "Mr. President, so far as the principle of the resolution is concerned, as I understand it, I indorse it; for, in brief, I think that Senators and Representatives ought to be entitled to the franking privilege upon all official business sent through the mails by them. But this subject is like most other subjects, the more it is considered the larger it grows. I once heard a soldier say as to the beef they got in the army, that the more they chewed it the thicker it got; so the more we masticate this subject the larger it seems to get.

"The joint resolution proposes to make an addition to a regulation that already exists. It would necessarily form a portion, either by an addition or an amendment of some character, of the postal laws that now exist in the United States. I am in favor of the Committee on Post-Offices and Post-Roads taking the joint resolution and incorporating its theory in the present existing laws and modifying it further, and in their own good time reporting it back to the Senate. In the first place the existing law provides that—

"Senators, Representatives, and Delegates in Congress, the Secretary of the Senate, and Clerk of the House of Representatives may send and receive through the mail free all public documents printed by order of Congress; and the name of each Senator, Representative, Delegate, Secretary of the Senate, and Clerk of the House shall be written thereon, with the proper designation of the office he holds, and the provisions of this section shall apply to each of the persons named herein until the first Monday of December following the expiration of their respective terms of office.

"There is one provision in reference to congressional documents. Then there is a provision relating to the Agricultural Department, as to how Senators and Representatives may transmit seeds, etc., through the mails. Then we have the 'Congressional Record' and extracts from that, which go free:

"The 'Congressional Record,' or any part thereof, or speeches or reports therein contained, shall, under the frank of a member of Congress, or Delegate, to be written by himself, be carried in the mail free of postage under such regulations as the Postmaster-General may prescribe.

"That by the laws is put under regulations to be prescribed by the Postmaster-General. Now, we have gone further, and provided that letters, etc., on Government business may go free:

"It shall be lawful to transmit through the mail, free of postage, any letters, packages, or other matters relating exclusively to the business of the Government of the United States: *Provided*, That every

such letter or package to entitle it to pass free shall bear over the words 'official business' an indorsement showing also the name of the department, and, if from a bureau or office, the names of the department and bureau or office, as the case may be, whence transmitted.

"What I have read embraces the features in reference to free postage. The difficulty in the proposition of the Senator from Illinois, it occurs to me, is that it is too loose, it is too liable to misconstruction; in other words, it is not sufficiently guarded in its language to make it safe. We have heard from several Senators who have been in the Senate longer than I have of abuses under these sections that I have just read as to letters, etc., on Government business. In order to make it, in common phrase, the more binding, the protection is to require an indorsement of the words 'official business' upon the matter, and there it ends with the signature of the person or persons sending it or a stamp showing that. If all the abuses existed in reference to this feature that were indicated by the Senator from Ohio [Mr. Thurman], and the Senator from Vermont [Mr. Edmunds], what may we not expect under the utmost scrutiny in the way of abuses under this phraseology indicated by the Senator from Illinois?"

Mr. Blair, of New Hampshire: "Does the Senator from Arkansas mean to be understood that we receive under franks speeches not made in Congress?"

Mr. Garland: "Yes, speeches and documents, and pamphlets of various kinds."

Mr. Blair: "Under the frank of members of Congress?"

Mr. Garland: "No, but under this section 249 from governmental officers. There is no one to determine whether the matter is 'official business' or not, or what kind of official business it is. In the section which I have just read allowing the indorsement of the superscription 'official business' upon official envelopes signed by the head of a department, or a clerk in the office sending them, no one is provided to determine whether they are on 'official business.' This joint resolution in regard to Representatives or Senators uses the same words 'official business.' It is possible that neither the Senator from Illinois nor any other Senator could go into enacting a law so as to define specifically what is meant by 'official business,' and what particular letters would come under that characterization. To protect against that in the matter of the 'Record' it is provided that that shall be sent under regulations prescribed by the Postmaster-General; but here this is left without any protection. It is not worth while for a Senator to say that we all know what 'official business' is, because we know in the practice of the law that words very simple in every-day use and common acceptation, when they are to be interpreted in law sometimes mean very different things, and are sometimes construed to be very different from their plain meaning.

"I recollect in the course of my reading to have seen that it was once a very grave question before one of the courts of England whether a turkey came within the designation of a bird, and after a long argument and long examination it was solemnly decided that a turkey came within the classification of the word 'bird.' It is possible some one might doubt as to whether, if I was writing to my constituents about a peck of oats, that could be deemed 'official business.' I might feel inclined, for the purpose of self-protection, to say it was official business, but the Senator from Missouri or the Senator from Tennessee might not think so."

Mr. Conkling: "Will the Senator allow me to make an inquiry? Am I right in supposing that he stated that speeches which are not a part of the 'Congressional Record,' not made in Congress, go free through the mail?"

Mr. Garland: "I say I have received under these superscriptions pamphlets of different kinds that it did not occur to me referred to any particular official business or any legislation in Congress or pending before either House."

Mr. Conkling: "But speeches?"

Mr. Garland: "Speeches."

Mr. Conkling: "Speeches not made in Congress?"

Mr. Garland: "Speeches not made in Congress; a speech made, for instance, before the Bankers' Association in New York."

Mr. Conkling: "Mr. President, if I understand the Senator from Arkansas aright, he says that he himself has received through the mail communications covered by the official frank of the executive officers of the Government, which communications contained no public or official business, but speeches made by somebody—I did not hear by whom—and not made in either House of Congress. Do I understand and report the Senator aright?"

Mr. Garland: "The Senator from New York quotes me with literal correctness, with this exception: that so far as I could see they pertained to no official business and no matter of legislation pending in either House of Congress."

Mr. Conkling: "Mr. President, if a stinging commentary, if a sharp and thorough criticism upon the absurdity of the law as it now stands were needed or possible, the Senator from Arkansas has pronounced that commentary. Here are provisions under which any and every clerk in the Post-Office Department and in every other department; every postmaster, every deputy-postmaster, every postmistress, every deputy-postmistress, every man, woman, and child, as far as I know, engaged in conducting the public business, may determine each by himself or herself at the time that it is 'official business,' place upon mail-matter a frank which exempts it from postage and carries it free through the mail wherever the mail goes on land or sea, or inland on water or on

horse, wagon, or stage-coach. How is this done? Not by the sign-manual of the person, not as the honorable Senator from Illinois is compelled to frank, what he is not privileged to frank, but compelled to frank in the course of his duty, by putting his name broadly upon it and the title of his office, so that everybody may know exactly the individual from whom that frank comes, but by placing upon it a printed stamp as good in the hands of one man as in the hands of another, a stamp which like money has no color, and leaves no track and no trace.

"I believe the Senator from Vermont [Mr. Edmunds] said that the men who make the laws are picked out as the only public servants unsafe to be trusted with franking official matter; and they whose business is, not even to interpret the laws but only to execute them, and that not only in the highest but in the most paltry function, they *en masse*, not some of them, but all of them without exception, are denoted by the law as safe and proper trustees and custodians of this franking power. And then, as if to cap the climax of absurdity, they are to do it, not by making a mark, not by putting an initial, not by signing a name, not by leaving a track or trace by which they can be known, but by an anonymous printed stamp, which one man's hands as well as another's can affix to a document. Thus you have it said that a Senator or Representative is not fit, although he signs his name, to exert this power, and that any and every other officer of the Government is fit without any sort of responsibility connected with the act, or any mode of identifying him; and thus, as might not unnaturally be supposed, although I should like to know, if I could, without prying into it unduly, from which department such a speech as the Senator refers to came, and who was the author of that speech, it turns out that speeches oratorical, political, didactic discourses made by we know not whom, whether as electioneering documents for a party or electioneering documents for an individual, are sent out, not I infer in an exceptional case to the Senator from Arkansas, but sent out generally. It is possible that the Senator from Arkansas, ardent and well known as he is as a supporter of the present Administration, may have been selected from pure favoritism and a little compliment and decoration sent to him, a speech with an official frank, perhaps intended to make the Senator from Arkansas feel good, to let him understand that he was on a footing with 'the most favored nations,' that compliments and attentions were paid to him such as are withheld not only from the rest of his fellow-citizens but even from his brother Senators. But making all allowance for the distinction of the Senator, making deduction for his intimate relations with those who wield this franking privilege, I take it that the result of his statement is that generally and at large this particular

mail-matter to which he has referred was transmitted through the mail.

"Mr. President, I submit that if a condition of things could exist which would show plainly and clearly the peremptory and urgent duty of changing this condition of the statute, here it is. If any Senator will affirm by a bill that the franking privilege should be cut off altogether, that there shall be a special account of postage in every department, that each shall pay its postage and have it charged to that fund, so be it. I will not say I will vote for it, but I say it will be respectable comparatively; but to leave the law to stand as it does now, to leave the Senator from Illinois to be mulcted because he happens to come from a large and populous State, and because he happens to have been a distinguished military officer, which leads pensioners naturally to resort to him over the country—to leave him to be mulcted at the rate of ten dollars a week to pay out of his own pocket, not his own but official postage, while every head of a department is furnished with official stamps under which editions of speeches may be sent out and all manner of other matter, is, I humbly submit, an absurdity so gross and an injustice so indecent that it rightfully appeals to the self-respect of every Senator and of every Representative, and it also appeals to the regard that they have for the interest of the cripples, the mourners, the orphans, the pensioners of this country, who I think have quite as much right to receive, being exempted from the three or twelve cents it would cost to pay the postage on them, their pension papers as any Cabinet minister has, when he is moved to utter his voice to his countrymen, to command the means out of the public purse to send out an edition to fall like a snow-storm from the mail over the whole country."

The joint resolution was referred to the Committee on Post-Offices and Post-Roads.

In the Senate, on January 14th, a joint resolution appropriating \$2,500 to meet the expenses of the International Sanitary Conference at Washington was considered:

Mr. Davis, of West Virginia: "There is a letter here from the Secretary of State, which in justice to the committee ought to be read."

The Presiding Officer: "The letter will be read."

The Chief Clerk read as follows:

DEPARTMENT OF STATE, }
WASHINGTON, December 27, 1880. }

SIR: In reply to your letter of the 21st instant, touching the joint resolution approved by the House of Representatives and now before the Senate, appropriating \$2,500 to meet the expenses of the International Sanitary Conference, I have the honor to inform you that the amount estimated for by this Department was \$10,000, or so much thereof as might be found necessary. The expenses which the Department will be required to meet under the joint resolution of May 14, 1880, will consist (besides ocean telegraphy incident to obtaining the responses of foreign governments) mainly of the employment of skilled stenog-

raphers and clerks capable of reporting speeches and propositions made in French or Spanish, and of the daily composition and printing of the protocols of the session. It is, of course, impossible to say in advance just how much these items will amount to. If the conference remains in session only a few days, it is possible that the sum appropriated by the resolution of the House of Representatives may be sufficient to defray expenses. But if the sessions are at all protracted, and especially if the discussions should take an extended range, the necessary cost of the most economical management of the conference might amount to the sum originally suggested by this Department. I have the honor to be, sir, your obedient servant,
WILLIAM M. EVARTS.

HON. HENRY G. DAVIS,
Chairman of the Committee on Appropriations,
Senate.

Mr. Carpenter, of Wisconsin: "Mr. President, I find myself once more compelled to sit at the feet of the Democratic doctors on a constitutional question. I want to know from them what authority is conferred by the Constitution of the United States upon Congress to vote any money out of the Treasury for any such purpose. I want to know, in the second place, whether Congress can appropriate any public money for a cause over which and as to which it has no jurisdiction. I want to know, in the third place, who will vote for an appropriation of money touching a subject not committed to the Federal Government by the Constitution of the United States. I would be very glad indeed if any Senator on any side of this Chamber would furnish me the information in reply to those three questions, or either one of them."

Mr. Harris, of Tennessee: "It was my purpose to say that I had no hope of being able to give to the Senator from Wisconsin such information as will be satisfactory to him, having heard the views of the Senator upon previous occasions as well as upon this in respect to this question."

"If there be a constitutional warrant, as I have believed and still believe there is, for this appropriation and kindred appropriations that have been made, it will be found to rest upon the power to regulate commerce with foreign nations and among the several States."

Mr. Carpenter: "That would be touching the communication of diseases?"

Mr. Harris: "It is touching commerce; and if the Senator will take the trouble to investigate the legislation of Congress upon the subject of commerce (which he has doubtless done very many times, and is very much more familiar with it than I am), he will find that there are innumerable instances in which Congress has legislated regulating commerce in the interest of health and comfort as well as in other respects, regulations as to what passenger-vessels shall carry and what they shall not carry, all of which regulations are in the interest of human health and the safety of human life."

"But the power to regulate commerce the Senator and I can not possibly differ about. I do not think it probable we can differ very

widely as to the extent of the meaning of the term commerce, and what is embraced in it. Intercourse, travel, and whatever is connected with the travel of persons as well as the transmission of goods, is commerce, and falls within the scope of the general power that Congress has to regulate it."

"Upon a former occasion, where a similar question arose in respect to the creation of the Board of Health and clothing it with certain powers, the same question arose. Of course I do not pretend that Congress ever had the authority to appropriate money to any such purpose unless the things to be done, the powers to be exercised, are proper and legitimate regulations of commerce and falling within that clause of the Constitution, but I think that Congress has the power in the regulation of commerce to so regulate it as to strip it of elements dangerous to human health as well as those which are injurious to the pecuniary interests of trade or revenue."

Mr. Carpenter: "Mr. President, nothing is more ungracious and nothing more unpleasant than to be constantly compelled to interpose objections to things which everybody will agree are desirable to have done. Take the subject of agriculture. Everybody says it would be a good thing to improve it, and to improve the conveniences for carrying it on. So with education; so with public health; so with a thousand things, which in the frame-work of our Constitution has been left to the States and not conferred upon the General Government. If the proposition were to be submitted to amend the Constitution so as to commit the regulation of education to the General Government, I would vote for it. If the proposition were to be submitted to permit the United States to provide for the public health of the Union, I might vote for that; but when I came into this Chamber I was compelled under the rules of this body to go to the desk and swear to support the Constitution of the United States, by which I understood then, and understand now, that I took an oath that in any act or thing done by me as a Senator I would observe and obey the Constitution; I would exercise my best judgment and reason, and in all things act in conformity with the Constitution."

"Upon this question I can see no more power in Congress to enter upon the regulation of the health of the Union, or to invite conventions with foreign nations to consult with and advise us, any more than I can see the power to do anything in the world that you can demonstrate is desirable to have done by somebody."

"I believe sincerely that the prosperity of this country depends upon an honest and faithful observance of the constitutional distribution of sovereign powers between the great Republic and the States; and although \$2,500 for this purpose is a mere bagatelle, yet the vote of Congress appropriating any money for

such a purpose does strike a blow at the Constitution."

Mr. Davis, of West Virginia: "How about the 'general welfare' clause? Does not the Senator think this is just in that direction?"

Mr. Carpenter: "I refer the Senator to the commentaries of Judge Story, and to all writers upon that clause. If the general welfare clause gives Congress power to do what it thinks the general welfare requires, what was the object of enumerating what Congress may do? Upon that construction ours is an unlimited government. Judge Story, *Federalist* as he was, says that that construction would carry the Government beyond all restraint, because if Congress has but to say that the public welfare requires a certain thing to be done, then it has the power to do it—"

Mr. Hoar, of Massachusetts: "The Senator does not say that Judge Story was a *Federalist*, that is, in any technical political sense?"

Mr. Carpenter: "I do not mean that; but I mean that he was a *Federalist* in his construction of the Constitution—that is to say, he was for construing the Constitution so as to give it some power. So am I. He was for construing it so as to give full play to all the powers which the convention framing it and the people adopting it intended and attempted to confer upon the General Government, and there he stopped. Discussing this question, and the very clause to which the Senator from West Virginia refers, he says that if that construction be given to that clause, then the Government is an unlimited one; that it was utterly unnecessary to proceed and enumerate the powers which might be exercised by the General Government."

Mr. Saulsbury, of Delaware: "I desire to ask the Senator from Wisconsin if the phrase 'general welfare' was not incorporated from the Articles of Confederation, where it evidently meant general interest in contradistinction to the local interests of the several colonies, and whether it has not the same import in the Constitution that it had in the Articles of Confederation?"

Mr. Carpenter: "Turn to the preamble of the Constitution:

"We, the people of the United States, in order to form a more perfect union, establish justice, insure domestic tranquillity, provide for the common defense, *promote the general welfare*, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution for the United States of America.

"Nothing can be plainer, it seems to me, than that this is the true construction of that clause. For the purpose of securing the ends recited here, the public welfare among others, this Constitution is adopted.

"Now we proceed to see what is the Constitution adopted. The Constitution creates Congress. It then gives Congress power to do all the things which they who framed this instrument believed were essential to promote

the common welfare, and so of all the other ends intended to be secured and reached by this preamble in the Constitution. It was a mere statement of the reasons which induced our fathers to create this Government, of the reasons which induced them to give these certain enumerated powers to the General Government; but was not intended to so provide the means by which these ends were to be secured. That was done by the Constitution. So Congress is authorized to raise money to secure the common welfare in the way the Constitution has adopted to secure the general welfare. And in no other way.

"Whoever construes this clause so as to say that whatever will conduce to the general welfare, Congress shall have the power to do that, must do it as to all other subjects, as to everything that will contribute to establish justice, insure domestic tranquillity, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity. I ask what can be conceived of within the scope of governmental powers that will not contribute, if wisely conducted, to one or the other of these ends? In other words, if you hold the preamble of the Constitution as conferring power, this Government is as absolute as the Government of Great Britain. We have not a republic limited by the Constitution, its powers specified, and their exercise regulated, but we have a Government that can do everything which it deems necessary to promote justice, insure domestic tranquillity, provide for the common defense, promote the general welfare, etc.; and what greater power has Great Britain?"

"That is the argument not of myself, but of Judge Story, upon this subject, and of all the men I have ever read who are regarded as authority upon the Constitution in discussing the effect of that clause.

"This whole subject of the regulation of health may be important, but to say that it is a part of the regulation of commerce, seems to me to be fanciful; it seems to be furnishing a pretext for doing what we have made up our mind to do and really have no power to do.

"The thing under consideration is providing for the public health, but he says this may be done because it is a mere incident to commerce. If you were regulating commerce in the proper sense of the word, by regulating the construction of ships, and the conveniences they should have, and all that, you would undoubtedly be authorized to take into consideration the effect of the construction upon the health of your sailors and passengers. That would be a part, a detail, an incident to the regulation of commerce in the proper sense; but we are not regulating commerce; we are not providing for the building of ships; we are not contemplating any such thing. We are contemplating the single subject of human life and of health, important, I concede. As I have said, perhaps I might vote for an amendment to the Consti-

tution which would confer the power, but I deny most respectfully that it is conferred. I deny that any man who is supporting the Constitution can vote for an appropriation in aid of any subject, no matter how important and generally useful, that is not committed to the jurisdiction of the General Government."

Mr. Garland: "Mr. President, the objections urged by the Senator from Wisconsin have been urged before, and a great many more. Some two years ago, when a similar question was up, everything that is said by him to-day and much more was said. He was not here at the time, I believe, to participate in that argument. The question was argued by a number of Senators on both sides for and against the general proposition, and every case was referred to and commented upon, from *Gibbons vs. Ogden*, in 9 Wheaton, down to the celebrated cattle case in 5 Wallace, on the subject of commerce between the States. The general power to take care of the health of the country was put upon three different clauses of the Constitution, one of which the Senator from Wisconsin has not referred to: first, the commercial clause, which was referred to by the Senator from Tennessee; second, the general-welfare clause; but clause No. 2 of section 10 of Article I was also referred to and commented upon to some extent by myself, and I was supported in that by Judge Story, the authority that has been referred to by the Senator from Wisconsin. That clause is as follows:

"No State shall, without the consent of the Congress, lay any imposts or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws; and the net produce of all duties and imposts, laid by any State on imports or exports, shall be for the use of the Treasury of the United States; and all such laws shall be subject to the revision and control of the Congress.

"Judge Story said in the second volume of his 'Commentaries' on the Constitution that there was ample authority for the exercise of this power. It is now late in the day to urge an objection of that character. We have had sanitary regulations or a quarantine law, so to speak, ever since 1790 upon the statute-book of the country. In 1879 that statute was considerably enlarged by the Congress of the United States by an act entitled 'An act to prevent the introduction of contagious or infectious diseases into the United States.' That act was passed April 29, 1879. The following year that statute was considerably enlarged by a general health bill, which was reported from the special committee by the Senator from Tennessee, and which received the sanction of the two Houses of Congress with some amendments. On the 14th of May last Congress passed the following joint resolution:

"That the President of the United States is hereby authorized to call an international sanitary conference to meet at Washington, District of Columbia, to which the several powers having jurisdiction of ports likely to be infected with yellow fever or cholera shall be invited to send delegates, properly authorized, for the

purpose of securing an international system of notification as to the actual sanitary condition of ports and places under the jurisdiction of such powers and of vessels sailing therefrom.

"As I understand, in pursuance of that joint resolution this conference was invited, and in pursuance of that invitation the conference has met.

"It is now in session in the city of Washington. Now the question comes up, Shall we simply discharge an obligation upon us to meet the exigencies of this conference, which we have solemnly invited by three laws, and the constitutionality of every one of which was discussed, if I may be permitted to use such an expression, *ad nauseam*? The question now is, Shall we defray the expenses of that sanitary conference that we have invited to meet here? I do not see that at this day there is any argument left in respect to that matter."

Mr. Carpenter: "That is not the question I put. The question I put was whether the Constitution authorizes us to do it?"

Mr. Garland: "I think it does."

Mr. Carpenter: "Then I do not see that the other is the question. I agree with the Senator that if we ask a man to work for us, if we can pay him we ought to do it; but the question with me was, Where do we get the authority to do this? We are not giving our own money to pay these men. That would be very proper, and I should be very willing to contribute half of all I have got (and I should not be out more than the price of a cigar at that), but the question is whether I have got any right to vote the money of the people of New York for such a purpose."

The joint resolution was reported to the Senate without amendment, ordered to a third reading, and read the third time.

The roll-call having been concluded, the result was announced as follows:

YEAS—Allison, Anthony, Beek, Booth, Burnside, Call, Coke, Davis of West Virginia, Dawes, Ferry, Garland, Groome, Hampton, Harris, Hoar, Johnston, Jonas, McMillan, Morgan, Morrill, Platt, Pugh, Randolph, Rollins, Slater, Voorhees, Wallace, Whyte, Williams, Windom—30.

NAYS—Brown, Carpenter, Cockrell, Farley, Ingalls, McPherson, Pendleton, Plumb, Saulsbury, Saunders, Teller—11.

ABSENT—Bailey, Baldwin, Bayard, Blaine, Blair, Bruce, Butler, Cameron of Pennsylvania, Cameron of Wisconsin, Conkling, Davis of Illinois, Eaton, Edmunds, Grover, Hamlin, Hereford, Hill of Colorado, Hill of Georgia, Jones of Florida, Jones of Nevada, Kellogg, Kernan, Kirkwood, Lamar, Logan, McDonald, Maxey, Paddock, Ransom, Sharon, Thurman, Vance, Vest, Walker, Withers—35.

So the joint resolution was passed.

In the House of Representatives, on January 28th, the following bill was considered:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Secretary of the Treasury be and he is hereby authorized and directed to pay, out of any money in the Treasury not otherwise appropriated, to Mrs. Elizabeth P. Page, widow of the late

Captain Hugh N. Page, the sum of \$136.85, being the balance of pay due the said Hugh N. Page, as captain in the United States Navy: *Provided*, Said payment shall not be made until the said Elizabeth P. Page files with the Secretary of the Treasury copies of her letters of administration, showing that she is the lawful representative of the said Hugh N. Page.

Mr. Brewer, of Michigan: "Mr. Chairman, I do not wish to take any great length of time in discussing the question involved in this case. It is simply this, that the husband of the claimant in 1811 entered the naval service of the United States. He served as a faithful officer until 1861, when the State of Virginia withdrew her allegiance from the General Government. He sent in his resignation, setting forth those facts to the Secretary of the Navy. The resignation was accepted soon after. After the resignation had been forwarded to the Secretary of the Navy he immediately entered the Confederate service. How long he served in the Confederate Navy I am unable to state. Whether he was killed in the service of the Confederacy or not I am wholly unable to state. But we find that he died at some time afterward, and that the widow now comes to Congress and presents her bill, asking that the sum due him when he sent in his resignation to the Secretary of the Navy shall be paid. There is no question between the majority and the minority of the committee but what there was due to Captain Page, at the time he resigned, the sum of \$136.85.

"In 1867 Congress sought to cut off and prevent the payment of all such claims, and passed an act which prohibited any department of the Government to pay any account, claim, or demand against the United States which accrued prior to the 13th day of April, 1861, in favor of any person who promoted, encouraged, or in any manner sustained the rebellion, or who during such rebellion was not known to be opposed thereto and distinctly in favor of its suppression.

"Now, Mr. Chairman, it may be stated by the gentleman who made the majority report, that the time has come for ordering otherwise. These claims were not to be paid 'until otherwise ordered,' and the gentleman sets forth in his report that the time has now come, in the judgment of the committee, when it should be otherwise ordered.

"I should like to know why it should be ordered now, any more than at the time the act was passed, that these claims should be paid. If it was right that these claims should be paid, then it was wrong to enact the law. If it was right they should not be paid, then it is no less right now.

"Our friends who make this report may come and say this is but a small sum, \$136.85. They may say that this lady who now presents this claim as the widow of Captain Page is poor and needy. They may seek to play upon the sympathies of this committee and of the House, so as to secure the passage of this claim. I know how easy it is to raise a sym-

pathetic feeling in the minds and hearts of members of this House. We saw it illustrated here in the passage of a bill, which but a little while ago was before the committee. And it is the fact that claimants come here before the House and before the Committee of the Whole and present but one side of the case, and appeal to the sympathies and hearts of the members for relief.

"Now, I say the widow of Captain Page could acquire no higher rights against the Government than those possessed by her late husband; and if it had been right to have paid this claim, then it should have been and would have been paid to Captain Page years ago, instead of its being claimed for the widow now. The same principles are involved upon this claim, and in this case, as would be involved if there was a million dollars concerned; no more and no less.

"We are establishing a precedent to-day, and if we pass this bill then we ought immediately to repeal the act by which the payment of this claim and those of others like it is prevented. If this claim is right, which is presented by Mrs. Page, then I say there are a thousand others who have equally meritorious claims, and they should be paid as well as this widow. I insist we ought not to attempt to do here in part, what we in my judgment, in this Committee of the Whole or in this House, will not do in whole, and what the country would not approve of our doing."

Mr. Goode, of Virginia: "Mr. Chairman, I regret that the gentleman from Michigan [Mr. Brewer] seems disposed to make such strenuous opposition to this little bill. What is it? If I can get the attention of the committee for a moment, I am sure that gentlemen on both sides of the Chamber will agree with the majority of the Committee on Naval Affairs that the bill ought to be favorably considered.

"And I want to say, Mr. Chairman, for the information of gentlemen on the other side of the House surrounding the gentleman from Michigan who has just spoken, that this is a unanimous report from the Committee on Naval Affairs, with two exceptions.

"It appears from the report that Captain Hugh N. Page entered the United States Navy as a midshipman in 1811. He was present at the battle of Lake Erie under Commodore Perry, and exhibited such conspicuous gallantry on that occasion that the Government voted him a sword. He remained in the service of the United States until the breaking out of the civil war in 1861, when he tendered his resignation for the reason stated by him, because his native State had adopted her ordinance of secession.

"Now just here let me say that the report of the committee is slightly inaccurate. I do not attach any blame to the gentleman from Michigan [Mr. Brewer]. He was misled by the report of the majority of the committee. Since that report was submitted I have been

informed that it was slightly inaccurate in this: it says that Captain Page entered the service of the Confederate States. That is a mistake. He was too old a man to render any service, being seventy years of age when the war broke out. All he did was to tender his resignation in proper form as an officer of the Navy of the United States; which resignation was accepted by the Government."

Mr. Hawley, of Connecticut: "Did he state any grounds in his resignation?"

Mr. Goode: "The only ground was that his native State of Virginia having adopted an ordinance of secession, he tendered his resignation as an officer of the United States Navy; that was his only reason."

"It appears that at the time of that resignation, which was accepted by the Government of the United States, there was a small pittance of \$126.85 standing to the credit of Hugh N. Page on the books of the department. It is not disputed by gentlemen of the minority of the committee that this money was fairly and honorably earned by Captain Page. It is not disputed by anybody that the Government owed it to him at the time of his resignation, and owed it for faithful services rendered during a long and brilliant career. He died with this little pittance standing to his credit. His widow now comes, as his legal representative, and asks the Government to pay to her, as the representative of her late husband, what was legally due to him at the time of his death."

"Gentlemen say it is a just claim; gentlemen say the amount is due; gentlemen say it has been fairly and honorably earned; but they are unwilling to pay it because of section 3,480 of the Revised Statutes."

"Now I submit to this Committee of the Whole, that it was never contemplated by the Government of the United States to confiscate for ever a claim like this. I apprehend the Government only intended to suspend, for the time being, the payment of such claims. Why? It was the period of reconstruction. The States had not yet been fully restored to the Union. Nobody knew then how many such claims might be preferred against the United States, and Congress in its wisdom, in 1867, thought that it would be good policy to suspend the payment of these claims until they should think proper to 'order otherwise.' They never intended to confiscate them. The Government never undertook to confiscate the property of any man who went into the rebellion."

"I claim that this is as much a debt due to the estate of Captain Hugh N. Page as if he had held the bonds of the Government at the time he died. It was to his credit upon the books of the department. He had earned it. He had rendered a *quid pro quo*, and it stood to his credit at the time of his resignation, and stands to his credit to-day on the books of the Treasury Department."

Mr. Conger, of Michigan: "Mr. Chairman,

one after another of these old claims comes creeping into this House, stained all over with the record of their disloyalty. When they come they always have their advocates. The reasons given for passing this class of bills are always plausible. If it is a claim on behalf of a college, it is an 'old college' that has educated great men, and the passage of the bill is demanded, and demanded by the gentleman from Virginia in favor of education. Year after year, day after day, William and Mary College is made the entering-wedge; and gentlemen are rallied to the support of that bill by plausible arguments in favor of education, in favor of antiquity, in favor of 'the first educational institution on the continent.' No matter what the subject may be, there are always plausible, eloquent, sympathetic reasons given for the passage of the bill. Generally there is great force added to the bill because it is a 'little' thing. I think I have observed—and if I am mistaken in this, the gentleman can correct me—I think as a general rule my friend from Virginia gathers all his intellectual forces around a 'little' thing. Because it is small, because it is weak, because it is feeble, he comes to its rescue with a chivalry worthy of himself."

"Now, what is this case? What does it present to you, and to me, and to this committee, and to the American people? Sir, it is the history of an adopted son of this republic placed in command above his fellows, commissioned to rule over other citizens in the Navy of the United States. As a gallant young man, on the broad waters of the lake which bounds my State; he won distinction with hundreds of other men. Was the country ungrateful for his services? Far back in that war of which Lake Erie was the scene, Congress rewarded the valor of this young man, presented him a sword; encouraged him from that time thenceforth and for ever, while his hand had the power, to wield that splendid gift of his country given him in reward of allegiance, of fidelity, of valor—to wield it for the country which thus honored him, which thus glorified him, which thus told the world how the republic would reward its faithful and devoted sons. Years passed on—a half-century of honors, of promotion—until this man was elevated to the highest rank in the Navy which our laws recognize—honored, trusted, loved; and there came a time when in the madness of the hour, instigated by traitors, by rebels, that State of Virginia tore down the banner of the Union, and proclaimed to her sons that she set up an independent government for herself. Virginia, not the most deserving by far, but the most honored of all the States in the American Union, was the first to lay an unholy hand upon the banner of the Union and strike at its life. And this son of Virginia, for fifty years the honored representative of that State in the Navy of the United States, engaged then in upholding the flag of

his country, honored with the highest command which could be given to the son of any State, immediately upon hearing that the State to which he belonged had become dishonored—had become traitorous, had rebelled, had struck down the flag, had withdrawn from the association which had honored the State, not which the State had honored—resigns that high position, hands back to the Government with scorn and derision the honors conferred upon him, resigns his high commission, but carries off in his old trembling hand the sword which the nation had given him, carries it off to use it to strike the heart of the nation which gave it. [Laughter on the Democratic side.] Ah! those gentlemen laugh and sneer; perhaps they did the same. [Laughter on the Republican side.] I do not envy the smile that gathers upon the faces of some gentlemen on the other side of the House—the smile of their derision at the picture I have drawn. It is a becoming exhibition of the contortions of which the human face is capable under adverse circumstances. [Laughter.] It treats well of the wisdom and power of that Creator who can make a face subservient to the rule and will of the mind, which shall show a contrary feeling to that which exists within the breast sometimes. [Laughter.] Now, sir, that is the picture of this man.

"The gentleman says he was too old to engage in the Confederate service. He was not too old to resign and leave the service of his country. He was not too old to tell the officials of his Government that he did resign because his State was treacherous, because it was rebellious, and that he was hurrying to leave the service of his country that he might fling himself, old as he was, trembling as he was, paralyzed as he was, with his remaining vital forces into the arms of his treacherous and rebellious State, to aid it either by force of arms or by counsel and advice and encouragement.

"Ay, sir, it is reported to have been said by a distinguished general in the service of the United States, that the South had robbed the cradle and the grave to bring strength to their cause. Here was this man not yet in the grave. Here was this man who had gone to Virginia to aid Virginia in its treason. The law said to all such men and all officers of this Government, a law enacted and re-enacted: If you will thus, in the day of your country's emergency and danger, forsake your post of duty, there shall be no payment made to you for services either past or present. That law for twenty years almost has stood on the statute-book of the nation. That law for six years almost standing there has never been attacked by any man whose face now lights up with sneers at what I say. There is boldness among you, infinite boldness; but no man has had the courage to propose the repeal of that section. No man has dared to stand up before the American people and declare that law was improper or unnecessary, or ought to be repealed.

It remains to-day, sir, for the gentleman from Virginia—"

Mr. Goode: "If the gentleman will allow me, I think he is in error in that statement. It is my recollection that repeated efforts have been made to repeal section 3,480 of the Revised Statutes. Repeated efforts have been made in the other Chamber if they have not been made here, and there the question has been debated, but postponed and defeated in various ways."

Mr. Conger: "If there is such an effort, it is of record. I ask the gentleman for the record. I never heard of it in this Chamber."

"No, sir, the American people do not wish that law repealed. If that side of the House desire for any purpose, and so inconsiderable a one as this, to be on record for the repeal of the law which no hand has dared to touch for twenty years, I invite them to the issue. It seems to me as if the infinite variety of blunders of the Democracy would insure their ruin without any effort from our side of the House; and I say, let them put their votes on record, even in this case, which is an entering-wedge for thousands and hundreds of thousands of dollars to be taken out of the Treasury to pay up for the rebellion which is past."

Mr. House, of Tennessee: "It seems to me that this discussion has taken a very wide range, and aside from the merits of the case now before this committee. To what the gentleman from Michigan has seen fit to say on this occasion in reference to the South and in reference to this side of the House I care not to reply. It is not the first time that that gentleman has bawled himself hoarse in that case. It is not the first time the bloody shirt has been invoked by that gentleman to cover the cause of injustice.

"What is the case before this committee? It is the case of an aged widow asking—for what? For the pitiful sum of \$136 which this Government owed to her dead husband—owed before there was any war of the rebellion—for services that he had rendered his country. Nobody disputes that. She is the widow of a man who had reflected honor upon his country's flag in the past. This claim is for services he then rendered.

"Does the Government owe him that money or not? Does anybody dispute that the Government owes it? Suppose, Mr. Chairman, that I owed you the sum of \$136, and you and I were afterward to have a dispute or a falling out, and in order to punish you I repudiated the debt and refused to pay it. Between individuals such conduct would be infamous. Shall the Government place itself in that position toward this old widow?

"This Government has never attempted to confiscate this debt. If it had been confiscated, confiscation could not have lasted beyond the life of this officer; his heirs would have been entitled to it. Whatever may have been his faults, or whatever in the estimation of gentlemen may have been his crimes, he has passed

beyond the praise or the censure, the reward or the punishment of the House.

"His aged widow is now here asking for the payment of the sum of \$136 which the Government owed her husband for services he had rendered. That is the question. This House can refuse to pay this claim. The claim is seized upon by the gentleman from Michigan [Mr. Conger] as an occasion for delivering to this side of the House a lecture, and to vent what seems to be his inexhaustible spleen against the South and the cause of the South upon this side of the House, which has Southern Representatives. This claim is made the occasion of the long speech which he has delivered here—the claim of the old widow of an officer who reflected credit upon his country; the widow now coming here and asking the Government to pay the small debt that it owed to her dead husband.

"It does seem to me that there could not be a more meritorious claim presented to Congress than the claim of this old widow. I have nothing more to say about it."

Mr. S. S. Cox, of New York: "When, sir, are we to have peace? Just after the war, as we all know, General Grant reported that the Southern States were anxious for contentment and deserved confidence and amnesty. He was solicitous, willing to be at peace and amity with them, and they with the rest of the Union. They needed peace to give to their toil its reward, and our good-will to give them those interchanges which build up a common prosperity. Have fifteen years made no difference with you of the other side? Are you jealous because the South is growing in population and prosperity, in planting, manufacturing, and commerce; that her cattle, cotton, and corn are enriching her abundantly? Surely not. Why, then, this continual debate, as if their interests and ours were not one?"

"What is the object of opposing this bill? The debt is not disputed. What can be the object in trying to cut down or deny this little claim of an old widow, a claim of \$136.85? Is it only a pretext to display old animosities? Was there ever such monstrosity built on so small a foundation? Is it not time to have a better spirit in reference to the relations between North and South?"

"When General Butler was in our midst on the other side, and we debated a bill to restore to men who had been in the rebel army the old swords which they had worn gallantly in the battle of New Orleans, he favored the measure with touching and patriotic eloquence. He had the spirit of true soldierly chivalry. He said, 'Give back to the old soldiers the swords they wore in the war of 1812'; and men on both sides applauded the patriotic sentiment. What would he say were he here today?"

Mr. Chittenden, of New York: "I know a little historic incident connected with the outbreak of the rebellion which has some perti-

nency and a lesson for my friend from Michigan [Mr. Conger]. I knew a merchant in New York who sat by the side of an old commercial correspondent as the wires were about to tick that Virginia had seceded from the Union. The Virginian said, 'What shall I do if my State secedes?' The merchant said: 'If you have purchased your goods, take them and do the best you can; no man who knows you will refuse to deliver them even after Virginia has seceded.' Within half an hour the news came that Virginia had seceded. The Virginian then said to the merchant, 'You of course will not trust me now.' The merchant said to him: 'You purchased the goods fairly on yesterday. I will send them, and I will take all the risks. I have known you for ten years, and know that you will pay for them if you can; let the consequences be what they may, every dollar of the merchandise shall go if you want it.' It did go.

"Five years after the war was over, or perhaps three, this merchant of Richmond, Virginia, Breeden by name, a thorough rebel who gave his all for the success of the Confederate cause, returned to the merchant in New York and paid for the goods, every dollar, principal and interest.

"Now, it seems to me that if there be a widow asking for \$136 honestly due her husband who was an officer of the United States Navy, a debt for services which preceded the rebellion—if this Congress refuses to pay the debt, they, in my judgment, do an act which appeals to the manhood outside of Congress to see that another Congress shall find a way to pay it with double interest." [Applause on the Democratic side.]

Mr. Bragg, of Wisconsin: "This is a question, Mr. Chairman, in my judgment, which is, as I have said, a question involving a principle. It is a bill which involves, it is true, a very trifling amount.

"It was not the stamp-tax that brought on the Revolution. It is the principle involved and underlying this thing. Shall we wipe out all legislation which prevents men once in the service of the United States, and who abandoned their duties, from coming back again as claimants upon the public Treasury, because, forsooth, the leader of the claimants is a lady, old and gray, whose husband, in his youthful days, did serve his country with honor and distinction? If we do away with the principle here, where shall we end? If we pay this woman because she is old, if we pay her because she is needy, that is one thing. But if we pay her because she was the wife of an officer who resigned, and under whose resignation there comes up this bill and penalty which deprived him of his pay, he having placed himself in the position of suffering the penalty, that is another thing."

Mr. Davis, of North Carolina: "Was there any such law in existence at that time; any law that would deprive him of his pay?"

Mr. Bragg: "There was this law, and it is recognized everywhere, that he who deserts his country's flag in the hour of his country's peril is entitled to no respect from that country afterward, except such as she gives him by a mere generosity and as a gratuity."

Mr. Davis, of North Carolina: "If there was no law, then there is a constitutional right."

Mr. Bragg: "Mr. Chairman, I am not here to discuss the Constitution. If I were, I should say that the gentlemen who broke the Constitution and fled from it are not the men to hold it before me and ask me to support it. [Applause on the Republican side.]

"If this bill pass, there is no man who was in the American service, whether civil, military, or naval, but will come back to the Treasury of the United States for something which may have been due him for some few days before he deserted his country.

"I am anxious, Mr. Chairman, as anxious as any man in this House, never to see again or hear of the subject of the Southern rebellion. It strikes me as deeply and keenly as any man upon the floor of this House, and I would fain wipe it out for ever from sight and memory. But I say to my friends from the South, that when you want to end this controversy, when you want to close up these memories, it is no proper way to do it by bringing forward claims here and presenting them for consideration which keep alive those memories by constantly stirring up something that involves the discussion of the rebellion and the troubles which have grown out of it."

Mr. Goode: "I move to recommit the bill to the committee. On that, I believe, I have a right to be heard.

"Now, Mr. Speaker, since the discussion of this bill on last Friday, I have received a letter from the widow of Captain Page, in which she instructs me peremptorily to withdraw her petition. If I felt at liberty to consult my own feelings or be guided by my own judgment in this matter, I would without hesitation press this bill to a final vote in this House, because I believe her claim to be a perfectly valid one, and the Government is bound to recognize it by every consideration of justice and fair dealing. But I feel constrained, as I have stated, to obey the instructions I have received from this petitioner. The House will readily understand and fully appreciate the motives which have impelled her to this step. Her feelings have been so wounded by the fierce assault made upon the memory of her dead husband that she is no longer willing to furnish any pretext for a renewal of that assault. Her petition would never have been presented here if she could possibly have foreseen the result. She had not the remotest idea that the simple presentation of a humble petition for payment of a just debt by this Government would be seized upon and made a pretext for a rude and violent attack upon the cherished memory of

the honored dead, or harsh and uncharitable comments upon the character of the Southern people. She prefers to relinquish that claim for ever, and allow the Government to hold in its coffers money fairly and honorably earned by her husband, rather than afford any excuse for an attack upon his good name, which she holds more precious than money or even life itself.

"Now, sir, with the permission of the House, I want to make a single remark with reference to myself. Since the debate of last Friday it has been charged by Republican newspapers throughout the country, and it was intimated in that debate upon the floor of this House, that my object in presenting this petition was insidiously to establish a precedent for the payment of Southern war claims.

"I want to say to this House and the country that no charge could have been more unjust and more destitute of any foundation whatever. I presented that petition because it was my representative duty to do so after it had been sent to me for presentation. I presented it because I believed the country justly owed the amount of money named to the estate of Captain Page. I presented it because I believed section 3,480 of the Revised Statutes to be clearly unconstitutional and void, so far as claims of this character are concerned. I presented it because I utterly deny the power of the American Congress to pass any *ex post facto* law or bill of attainder. I presented it because I did not suppose that a single representative of the American people could be found who would be willing to withhold from this lady money honestly earned by her husband in the service of his country, especially as by that service he had illustrated American prowess, and shed additional luster on the American name."

Mr. Conger: "Mr. Speaker, I have nothing to reply to the remarks of the gentleman from Virginia if he says that he never has in this House presented or advocated the payment of war losses or war claims so called, with this statement that he excepts from that, because he does not consider them war claims, two cases he has advocated here, one of them the William and Mary College claim, which we all remember, which the country remembers, which was thundered through this land from North to South, exciting apprehension and fear in every hamlet in the North of the consequence of passing such a law, and exciting hope and expectation in the hearts of ten thousand men in the South who had war claims in which they were interested. I say I have nothing to say in reply to the remark of the gentleman from Virginia that he has never advocated war claims. Of course, we look upon the name of these war claims and war losses differently, and I give the gentleman the full credit for his avowal upon that subject according to his own construction.

"But, sir, when the gentleman stands there

as the representative and mouth-piece of all Southern representatives on the floor, when he assumes to rise in his place and claims to speak for all Southern men here and all through the South, and says that they do not now press, and they never have pressed, war claims properly so called—that they have not done so in every possible combination of language and words, by bills and memorials and petitions, that the human mind can conceive—the gentleman must allow me to question whether he does represent the people of the South, whether he does represent other representatives of the South on this floor, whether he does represent the millions of people of the South interested in the passage of war claims.

"I say that the time has come, if these statements are correct, and if the gentleman does speak for the whole South, that the wagons and the carts and the wheel-barrows should be brought here, and this accumulation of petitions, memorials, bills, and affidavits, and proofs that now fill the pigeon-holes in the room of the Committee on War Claims should be taken away. Yes, sir, I would like to see the procession formed. I would like to see the representatives of the South who have presented petitions and memorials and bills favoring the passage of war claims and the payment of war losses take their bundles of papers and march with them away from that committee-room and away from the Capitol. And who would be left out of that grand and solemn procession? I can myself imagine the whole Democratic side of this House in marching order, carrying back to their constituents the petitions and the memorials and the bills and the proofs, marching off to Long Bridge to the music of 'Carry me back to old Virginia, to old Virginia shore.'" [Great laughter.]

Mr. Goode: "I move to lay the whole subject upon the table. I think that ought to be satisfactory."

The Speaker: "The question will be taken on the motion to lay on the table."

The motion was agreed to.

In the Senate, on February 15th, the House bill to facilitate the refunding of the national debt was considered:

Mr. Bayard, of Delaware: "Mr. President, in little more than sixty days from this date a loan of the United States, bearing 5 per cent interest, and amounting to \$469,651,050, will, at the option of the Government, become payable. On the 30th day of June next two other loans, each bearing 6 per cent, the first for \$145,786,500, and the other \$57,787,250, will also mature at the option of the Government. These facts are stated in the last report of the Secretary of the Treasury, and will be found on page 10 of his report of last December. He has informed us that the surplus revenue accruing prior to the 1st of July, 1881, will amount to about fifty million dollars, and can and will be

applied in part to the extinguishment of that debt. Bonds maturing on the 31st of December last were paid out of the accruing revenues. So that there will remain the sum of \$637,350,600, to be provided for and funded at the option of the Government at such rate of interest as may be deemed advisable by Congress and can practicably be obtained.

"The sums that we are dealing with are enormous, affecting the welfare of every branch of our country's industry and of our entire people. The opportunity for reducing the rate of interest upon this enormous sum, and not only that, but of placing the national debt more under the control of the Government in regard to future payments, is now before us. The opportunity for doing this upon favorable terms should not be lost, and the only question before us as legislators is how we can best and most practically take advantage of the hour.

"Two propositions have been made, one by the House of Representatives and one from the executive branch of the Government. The Secretary of the Treasury, at page 12 of his report, has recommended the refunding of \$400,000,000 of the national debt at a rate not exceeding 3·65 per cent.

"It is also recommended that authority be given to sell at par an amount not exceeding \$400,000,000 of bonds of the character and description of the 4 per cent bonds of the United States now outstanding, but bearing a rate of interest not exceeding 3·65 per cent per annum, and redeemable at the pleasure of the United States after fifteen years, the proceeds to be applied to the payment of bonds redeemable on or before July 1, 1881.

"The House of Representatives has proposed that we should fix the rate of interest at 3 per cent, and make the bonds payable in ten years, with the option to the Government to redeem them in five years. Upon careful deliberation, and considering all the arguments from every respectable source that we could obtain, the committee of the Senate have modified both the proposition of the Secretary and the proposition of the House. We have reported to the Senate the issue of the \$400,000,000 of bonds recommended by the Secretary and the House, but we have fixed the interest at 3½ per cent, being a shade lower than that proposed by the Secretary and a slight increase upon the rate proposed by the House, and we have fixed the time of payment at twenty years instead of ten, with the option of paying the debt at the end of five years. The term five-twenties would therefore continue to be applicable to this form of the national debt, and one as to which having had experience of a most favorable character, and to which the people of the country have become accustomed, it was thought that feature alone gave it weight and increased the probability of its success.

"There are various reasons for this. Opinions have differed, and always will differ, as to this matter. Intelligent and patriotic men believe that it is practicable to fund the whole of this debt at the rate of 3 per cent. Others

again, equal to them in experience, ability, and opportunities of judgment, have told us there would be risk in the attempt. Speaking for myself and for the majority of the committee, we believe that the weight of authority is in favor of running no risk, and that the rate of $3\frac{1}{2}$ per cent per annum is that which under all the circumstances it is wiser and better for the United States to adopt in order to obtain freely the desired loans from the public.

"Consider for a moment the experience of other nations in this regard. At the head of the commercial world is the Empire of Great Britain. Nowhere has government been more permanent or its institutions more stable, or the certainty of the repayment of loans and indebtedness secured by law more perfectly. The conditions, therefore, of low interest have been as perfect there as human institutions have ever been able to procure; and yet what is the result? When, in the last half century, the especial period of her progress and success, have the consols of Great Britain not paid more than 3 per cent to the investor? Yet those bonds have a feature which is denied to our own, and for my own part I can not regret it, and that is, the creation of a *permanent* debt. During the last fifty years the loans of Great Britain have touched par, I believe, but twice.

"It may be stated in regard to the rate of interest returned upon the investment of English consols that it has varied between 4 and $3\frac{1}{2}$ per cent. I am speaking now of the return upon the cost of the British consols to the investor. Sometimes it has paid more than 4, and sometimes even less than 3 per cent, but those have been the extremes of depression and exaltation of price. It may be said upon authority that the investor in British consols has during the last quarter of a century received on an average rather more than $3\frac{1}{2}$ per cent income.

"At page 5 of a pamphlet containing the report of an interview between the Secretary of the Treasury, the Comptroller of the Treasury, and the Treasurer, with the Committee on Finance, will be found a statement taken from the London 'Economist' of the 6th of November, 1880, to which I invite the attention of the Senate as corroborating the statement I have made.

"I have drawn the attention of the Senate to the fact that the consols of Great Britain offered to investors permanence and absolute security, not simply ultimate security, but that security which can be availed of at almost any day; and with these two elements so favorable to a low rate of interest they have not been able to maintain at par a loan at a rate of interest which it is proposed now to issue and maintain at par in this country. I shall ask the Senate to consider the difference of conditions in this country and Great Britain as affecting our bonded debt, and to show that we can not safely permit that fluctuation in prices

which to their government, under a system of permanent indebtedness, is a matter of absolute indifference. There are conditions in this country which render it imperative to maintain our bonds at par or over par. The Secretary of the Treasury has spoken of the traditions of the country and its policy to maintain our bonds at par. That statement has the authority of the country's history, but there is something more practical and practicable than mere tradition and policy. There is an absolute necessity for us to see to it that as we have tied our systems of banking and currency to the fate of our national bonds, they must stand or fall together. The currency of this country, upon which the main part of its business is conducted, and to which it has been made essential, is based upon the national credit. That currency is obtainable only by the deposit of national bonds, 90 per cent of currency being issued for 100 per cent of bonds upon their face value, and the sense of security so absolutely found in the excess of value of the pledge, the responsibility of the shareholder, and the reserve established by law, have made this credit money of the Government national-bank notes receivable with absolute and unshaken confidence. Senators, that confidence existing almost solely upon credit, must not be disturbed. We have to-day what is called a resumption of specie payments, but, to speak more accurately, we should call it a redemption of notes that are at once reissued at the will of the debtor. How is that resumption assured? It can not be said to be assured by the coin in the Treasury. We had at last accounts in gold coin and bullion \$140,952,837, and of standard silver money \$47,084,459; and that is to answer for \$346,000,000 of demand notes, and ultimately for the \$350,000,000 of notes issued by the Government through the national banks. What, then, is to-day our security that resumption can be maintained? Not the coin in the Treasury, surely; but the existence of the power secured by the act of January 14, 1875, that gives to the Secretary of the Treasury the right to sell Government bonds bearing 4, $4\frac{1}{2}$, or 5 per cent interest, to *any amount* necessary to buy gold and pay the United States notes whenever presented at the Treasury. It is, therefore, this potentiality standing in impressive and powerful reserve that overshadows any attempt to make what is called 'a run upon the Treasury' or endanger the permanence of resumption; and yet, bear in mind, those bonds, which under law are to be sold in order to supply the exigencies and meet the demand for gold, can not be sold at less than par. Therefore I say that we should permit nothing to go upon the statute-book, and take no step in the management of our finances, that even tends to send our bonds below par, because the par value of those bonds is essential to the absolute maintenance and security of specie resumption. It is the power to sell those bonds

under the act of 1875 that stands as the *corps de reserve* to enable the Government to pay specie for its notes on demand, and cause them thus to be an equivalent for specie. Under the free-banking system now in existence, the volume of our currency depends upon commercial demand and not upon political exigencies. Except for wise restriction as to the securities for loans and supervision as to reserve, the affairs of the banks styled 'national banks' are managed and controlled by the rules only of enlightened self-interest. They loan to whom, and as often, and as much as the directors elected by the private stockholders see fit—no more and not otherwise—and the Government has no voice or control in their affairs except in the manner that I have referred to; that is to say, supervision of the securities for loans and as to the reserve. In other words, to restrain them from conversion into trust and loan companies instead of banks, and unfitting themselves for the true functions of banking.

"I say, then, if nothing else must be looked to, the duty of placing resumption of specie payment beyond doubt would be worth ten times the amount of the difference between 3 and 3½ per cent, and I hold that we have no right to run any risks on this point; and as I have said and believe, the weight of opinion is against our running such risks as we would do if we adopt the rate of 3 per cent. Why should we take a step in the dark when it may be taken so clearly in the light? Why should we create a ripple upon this placid stream of prosperity upon which the affairs of our country are now floating? There is neither wisdom nor economy in taking steps that tend to check in the minds of the American people confidence in their progress and prosperity. Let us only take such steps as we can to justify that confidence, and secure them against retrogression.

"Let us solidify our credit, and secure our bonds and our credit moneys against depression and possible fluctuation. Wise, moderate, and timely legislation can do this.

"The rate of interest is, after all, controlled by the average rate of profit derived from the employment of capital. The profit of employing capital in industrious undertakings controls the rate of interest. A high rate of profit will always cause a high rate of interest. There is history for that. Where you have a low rate of profit, the interest for the employment of money necessarily will be less. The Dutch were the leaders of the commercial world in the seventeenth and the greater part of the eighteenth century; but they had resorted to a system of overtaxation, and, burdened by taxation, but little profit was left for the employment of money; and the result was that, as after all there is but a limited profit in production, and that profit must be shared by labor and capital, the rate of interest fell to an extraordinarily low rate; but where taxes were lighter, the employment of money was more

profitable, and the rate of interest increases in corresponding ratio with the profit on the use of capital.

"Under certainty of law for securing the prompt repayment of loans, interest is low; for it is not the ultimate security, but it is the punctual and reliable payment of money expected that makes the rate of interest low. Money will be cheap where confidence is established. The more absolute the security, the lower will be the rate of interest. I hold it that the demands for the employment of capital in legitimate enterprises all over the United States under this all-pervading sentiment of confidence that exists now, will make a Government loan at 3½ per cent equitably low enough. Money in the United States securely invested will be worth on an average—I am speaking now of business investments—anywhere 5 per cent, and in some parts of this country from 6 to 7 per cent, and this last only in the newly-settled districts. The United States is a younger country than Europe; it is more progressive; newer enterprises in the development of the natural wealth of this country necessarily exist here than in longer-settled countries, and employment of capital will find 'fresh fields and pastures new,' and the profits of industry are greater in the United States than elsewhere. The superiority in profitable employment of capital, therefore, in this country justifies a rather higher rate of interest than it would in Europe.

"We are sometimes told, 'Look at the present advanced value of the 4 per cent bonds; take them as your standard; they are now worth 113 in the market; if a 4 per cent bond is worth that, surely a 3 per cent is worth par,' etc. Why, as a matter of fact, has not this agitation of the issuing a 3 per cent loan been diligently and clamorously used for the last year—I do not say improperly, but vigorously used—as a species of menace to enhance the price of the 4 per cents? If there should be a compulsory power exercised by this Government, which I deprecate, toward the stockholders of the national banks to force this loan upon them as the single and arbitrary condition of their continuing in business or going into ruinous liquidation; if that power does exist, necessarily men will value that which pays them one fourth more interest, and the price of the bond that secures it will be necessarily advanced. Therefore I am compelled to consider the present price one of those fluctuating advances, temporary in its nature and caused by the abnormal and unsettled condition of things, that has given the 4 per cent bond the advance from par, at which it was sold, to the great premium which it now enjoys. I do not think it is either sound judgment or reasonable common sense to take the present advanced price of the 4 per cent bonds as a basis for calculation for the sale and maintenance of the price of 3 per cent bonds.

"I would here note that section 5 of the

House bill contains what I have spoken of as the compulsory power of the Government proposed to compel subscription to its loans. In section 5 of the House bill, which has been stricken out by the Senate Committee, it will be found that the bonds bearing 3 per cent were to be '*the only*' bonds receivable as security for national-bank circulation, compelling the banks to exchange any bonds bearing a higher rate of interest for those bearing the lower rate. That was intended to create an involuntary market for some two hundred and sixty-nine million dollars of these bonds. I did object, and do now to this, and the committee have reported against this compulsory feature, and I think they were wise and right in doing so. The exhibition of compulsory power, arbitrary power by a government over matters touching its credit, has never proved of ultimate and permanent value. It has rather suggested distrust, and lack of confidence in its own credit, that you should pass from our voluntary and free system of government to the involuntary and tyrannical; and there is in this compulsory action proposed toward the stockholders of the banks, created by act of Congress, an interference with their rights of private contract and the spirit, if not the letter of their chartered rights, which is discriminating and, in my opinion, unjust, unwise, and inexpedient. The real strength of this Government lies at last in the hearts of the people of the country; it can not be created and established by compulsory statutes; and we must and we ought to leave every class of our citizens, rich and poor, in this land, free to deal with their Government on equal and general terms applied without discrimination to all alike. The bonds under the present act as proposed by the Senate Committee on Finance will be receivable as security for circulation, and will be used as its basis as heretofore provided by law in relation to other interest-bearing bonds of the Government.

"Mr. President, it is shown that the expenses of the late refunding operations amounted to about three eighths of 1 per cent, and the tables of similar expenses, both in our own history and in the history of other governments, show that such an operation was never before conducted at anything like so low a rate. I do not mean to say that there has been nothing gained by experience, or that we should continue expensive and ancient methods, or that we should test the reasonableness of this expense wholly by the past; but I do mean to say that upon examination no candid American will complain of extravagance in the late accomplishment of refunding. I do not mean to say that the same rate of three eighths of 1 per cent may not fully cover the entire expense of carrying this act into effect; but I do say that for the matter of one eighth of 1 per cent we ought not to tie the hands of our agents when we compel them to make due return to us of every dollar expended, and it would be

both an unwise suspicion and an injurious act which would tend to jeopardize in any degree a transaction so vast and important as this under the possibility of restricting the cost by withholding one eighth of 1 per cent.

"I have not been able, had I been willing, but I would not have been willing, to consider this great question by the narrow light of party. I would not be willing to make cheap reputation out of mere party prejudices in dealing with a question like this, or to gain unthinking applause by suggestions of recklessness, extravagance, or something that is worse than either upon the part of high officials charged with a great and important duty to be exercised in the light of public examination with returns for every farthing expended under their responsibility. For that reason, while desiring every just economy, while not affecting to deal with easy liberality as to moneys I am not to pay myself, and being generous with the means of others, I still am not willing, in contemplating the results as are necessarily embraced in these immense and important operations to the people of this country, of so dealing with a gigantic debt; I am not willing to treat those who are to be the practical and responsible agents in the adjustment of this matter with undue or unworthy suspicion, or, I may add, to bind them down with undue and improper restrictions. There is a proportion to be observed in all things; and we are not bargainers with mere brokers when we place a moderate discretion as to the expense of this great business in the hands of high officials who are presumably men of self-respect and character.

"If in the future practical conduct of this business there should be a check in the smooth and successful operations of this refunding project because of the withholding of some small eighth of 1 per cent which being paid would secure success, and being withheld would frustrate it, I mean to say that responsibility shall not rest with me, nor do I envy the man who shall hereafter feel that it rested with him. For that reason, as faithful counselors and trustees of the interests of the American people whom we represent, we may fairly say to the Secretary of the Treasury, If you shall be able to effect this great operation, reducing the rate of our interest and confirming our Government credit at a cost not exceeding one half of 1 per cent, to that limit you may go, within that limit stand as far as you can, and go before the people of this country as a faithful administrator mindful of the needs and interests of those whom you represent, and take whatever of shame or glory shall come to you from your performance of that duty."

Mr. McPherson, of New Jersey: "The object of the proposed legislation is to complete the refunding of the national debt. Two hundred and two millions of 6 per cent bonds issued at the beginning of the war are about to mature, and four hundred and sixty millions

of 5 per cents issued under the refunding act will become redeemable on the 1st of May next.

"The duty of Congress, to my mind, is very plain, and may be stated in half a dozen sentences.

"First, the bond to be issued should bear the lowest possible rate of interest under which, considering also the period of time fixed for its payment, the Government would receive its par value in exchange for it.

"A 3 per cent interest-bearing bond, having forty years to run, with such earlier option on the part of the Government, not less than ten years from the date of issue, to pay it, would, in my opinion, meet this requirement, and in a short time command a premium.

"In proof of this we need only point you to the 4 per cent bonds, which were taken as a speculation by a syndicate for a large commission less than the par value, and are to-day sold in open market at such a premium as scarcely makes them a more profitable investment than a 3 per cent bond at par.

"Does it not also prove that should Congress authorize a funding loan bearing 3½ per cent, the bonds so authorized would, after passing into the hands of a syndicate, advance in the market to a price at which they would not yield over 3 per cent on the investment, and that it would thus be demonstrated that the Government might have saved the one half per cent per annum which investors and speculators had gained?

"Were it not for the lingering hope that the predictions so freely made, which I regret to say have not been dissipated by the Finance Committee of the Senate, that a 3½ per cent bond would be offered at par, no doubt would now be expressed in respect of the market value of a 3 per cent bond.

"With the whole bonded debt under the conditions now existing, selling so nearly on a 3 per cent basis, no other arguments beyond this simple fact seem to be required to sustain the belief that a 3 per cent bond of the United States can be negotiated at par.

"Confronted by this fact, the Finance Committee of the Senate report in favor of a 3½ per cent bond, and virtually ask the Senate to join it in a *bear* crusade upon the national credit. I read from the report:

"The Secretary of the Treasury is hereby authorized to issue bonds to an amount not exceeding \$400,000, of denominations of \$50, or some multiple of that sum, which shall bear interest at the rate of 3½ per cent per annum, payable semi-annually, redeemable at the pleasure of the United States after five years, and payable twenty years from the date of issue; and also Treasury notes to an amount not exceeding \$300,000, in denominations of \$10 or some multiple of that sum not exceeding \$1,000, either registered or coupon, bearing interest at a rate not exceeding 3½ per cent per annum, payable semi-annually, redeemable at the pleasure of the United States after one year, and payable in ten years from the date of issue; and no Treasury note of a less denomination than \$100 shall be registered.

"This report, taken in conjunction with the facts heretofore stated, seems most extraordinary. The four hundred millions of bonds are to bear 3½ per cent interest, although confronted by the fact, supported by every-day transactions, that said bonds could and would be negotiated on much better terms. It is not often the holder of a note thinks better of it than the maker, and this has become so universal in practice a reversal of the principle was never deemed possible. It seems, however, that axioms in financial practice, even universal principles which a credulous people believed admitted of no change whatever, may be switched off out of the way at the will and pleasure of a congressional committee. Outside of those immediately and directly interested in speculation in bonds—and the number of these is small when compared with the host of actual investors—there can not be found any considerable number of financiers who believe a 3 per cent forty-year bond can not be negotiated at par.

"These bond speculators, with untiring and unflagging zeal, aided by a subsidized press, seek to influence Congress by appeals to the fears of its members that an unsuccessful attempt to negotiate a 3 per cent bond would wound our credit and practically defeat resumption. How, they do not tell us. Pending action by Congress upon this bill, these same speculators have even attempted to depress the market by a free sale of 4 per cent bonds as information which would naturally influence Congress in favor of a higher and against a lower rate of interest; but, as the bonds have advanced 2 or 3 per cent, even under these assaults, it furnishes additional proof that to adopt the recommendation of the committee and issue a bond bearing 3½ per cent interest would be a national folly.

"The committee further recommend an issue of three hundred millions of Treasury notes, bearing interest at a rate not to exceed 3½ per cent per annum, redeemable at the option of the Government after one year, and payable in ten years from the date of issue.

"It will be remembered the bonds are to bear interest at the rate of 3½ per cent per annum, arbitrarily fixed. Said bonds have twenty years to run, with the reserved option to pay them after five years, while the rate of interest borne by the Treasury note shall not exceed 3½ per cent, implying that it might be possible to negotiate the notes at a lower rate of interest, notwithstanding the Treasury notes have only ten years to run, with the option to pay them after one year.

"Here, again, the committee set at defiance all laws which have ever governed commerce in finance, by assuming that a short bond, yielding to the purchaser at the discretion of the Secretary of the Treasury at or under the rate of 3½ per cent per annum, could be negotiated at par, while the long-term, and therefore better, bond, bearing a fixed rate of 3½ per

cent per annum, and no less, would not command more than the par value."

Mr. Bayard: "Would it interfere with the Senator if I should make an inquiry?"

Mr. McPherson: "Not at all."

Mr. Bayard: "Would the Senator desire to be understood as saying that it is not the fact in financial arrangements that a bond payable punctually and promptly at a short date, desirable for a certain class of pecuniary arrangements, can be negotiated at a lower rate of interest than a bond more prolonged as to its term of operation, and that, *per contra*, the bond having the longest term to run, and the more permanent for reasons connected with its own nature, is also negotiable at the lowest rate of interest, so that you have in this an illustration of extremes meeting? The short bond, upon the payment of which punctually absolute reliance can be placed, has its uses for certain classes of loans and occupations of capital which do not attach to a bond having a longer time to run; and a bond having the longest time to run, offering a permanent investment, has uses which enable it to be negotiated at a low rate of interest which is not known to a shorter date bond. Have I made myself clear?"

Mr. McPherson: "Certainly; I understand the Senator."

Mr. Bayard: "It is a fact perfectly well ascertained and understood in the practical dealings of men accustomed to large financial operations, that you exchange in one case the desirability of a short loan with absolute and punctual repayment for the permanence of investment with a long loan, absolutely secure, but only ultimately secure."

Mr. McPherson: "The absurdity of the proposition upon its face is so apparent that I am really surprised that the Senator confesses he has been deceived by it. I will admit the fact that a bond bearing any rate per cent, even if it be 1 per cent, can be used by speculators in Wall Street profitably, who carry over vast sums of money from one day to the other, and any percentage that it bears is an advantage to them; but the market for bonds the world over gives the preference to a long-time bond bearing a fixed rate of interest. If the honorable Senator will place the four hundred million issue of bonds that he proposes shall bear 3½ per cent interest in Wall Street, where many of them will go, perhaps all of them, and in connection therewith the \$300,000,000 of Treasury notes, with the option of the Secretary of the Treasury at any rate under 3½ per cent that he can negotiate them at, I wish to know which of the securities will be sought first? What difference will it make to a financier or capitalist whether it is a bond having twenty years to run, or a bond having ten years to run? He pledges the Government security for a loan, a call loan if you please, and the quality or value of the thing pledged determines the sum the borrower will receive."

Mr. Bayard: "If my friend will permit me, I will say to him it depends altogether upon the need and uses for which the money is designed. If a man awaiting some grand speculation or enterprise for which he has accumulated, for instance, half a million dollars, wants that money to be repaid to him at the end of a year, but to keep it useful during that year, and if he can buy the short bond which is bound to be paid at the end of that time, for a low market price, certainly it is an inducement to him to affix certainty to his operation and to borrow the money for just the time he wants it; whereas, on the other hand, if there be some one seeking a permanent investment for the execution of a long-continued trust, he will seek that bond which is not to be disturbed by repayment and reinvestment when he does not want it. Therefore, the whole question is answered. It depends upon the objects that the investor has in view. For one purpose a short bond is more valuable to him; for another class a long bond is more valuable; and in the mean time the fluctuation that may exist upon the long bond would be hurtful to the man who wants to use his money but for a year or two years, and the certainty of repayment of value at a fixed rate of interest to the man who needs the short loan is secured to him better by the low class of bonds. Therefore the whole thing speaks for itself."

Mr. McPherson: "A long bond, according to the admission of the Senator, will serve both purposes."

Mr. Bayard: "No, because it is subject to fluctuation."

Mr. McPherson: "Why can it not subserve both purposes? Suppose the honorable Senator to-day wishes to borrow a million dollars upon a million dollars' worth of 4 per cent bonds. He does not go to the Government to make that loan. He goes into the financial centers of the country; he goes to London, he goes to Wall Street. Those bonds have a fixed market value for that day's transaction. He borrows the money from the capitalist; he does not borrow it from the Government."

Mr. Bayard: "The Senator is in error—"

Mr. McPherson: "Therefore the 4 per cent or the 3½ per cent bonds have a value upon which to loan or to borrow money, just the same as the 3 per cent or the 3½ per cent Treasury note, and at the same time they serve the additional purpose of affording an investment for those who desire a permanent investment."

"The bonds of the Government are in active demand as investment by those who do not wish to participate in the hazards of business or speculation, but, without labor or risk, give sure return with absolute security."

"No other security can be compared to these bonds. Behind them, and pledged to their redemption, stand the whole wealth of the nation. Taxation can not reach them, and, if a registered bond, even the thief may be disappointed. They are in demand in all the money

centers at home and abroad—are wanted by everybody who prefers a perfectly safe to a speculative investment. Unless war shall demand the creation of a new public debt, these bonds will probably be the last the Government will ever issue, and as the demand will increase everywhere in proportion to the increase of wealth and population, in like proportion will their market value appreciate. The interest we promise and pay is the tax-payers' wages, and why throw away one half per cent per annum of their hard-earned money?

"For Congress now to say, with the light we have, that the discretion between a 3½ per cent Treasury note and one bearing a less rate of interest should be lodged with the Secretary of the Treasury is equivalent to discrediting our own obligation, and virtually foreordains and establishes the rate at 3½ per cent.

"Why, then, permit our bonds to be hawked about the streets subject to the whim or caprice of a Treasury Secretary or of the expectant purchasers, none of whom will invest in a 3 per cent bond while Congress proclaims its absurdity by fixing a higher rate?

"In my opinion, it is the duty of Congress to fund the debt at the lowest possible rate of interest; to extend the time for the maturity of the bonds to forty years, so that posterity may bear a share, although a small share, of the burdens created by the exigencies of the war. The present generation has contributed in the tremendous sacrifice of life it involved its full share of the cost. It has suffered in the waste and destruction always attendant upon civil war to an extent never before known in the history of any people. During the five years, commencing with 1873 and ending with 1878, the suffering by paralysis in business industry from causes contingent upon the war have had no parallel in the annals of the world. A somewhat disordered financial system, together with outer causes apparently uncontrollable, forced into bankruptcy tens of thousands of our citizens engaged in legitimate and honorable pursuits, closed the doors of our workshops and factories, and compelled the honest and willing laborer to become a tramp and seek bread from door to door. Notwithstanding all this, we have paid off more than one half our war debt. A grateful people, speaking through their representatives in Congress, have imposed upon the present generation a pension list which in the aggregate is frightful, and the burdens of which can not be shared by posterity, because the pensioner will not be alive to receive it.

"The war for the Union was fought for the benefit of all future generations, and it would be only equitable for posterity to share the expense.

"The money to pay this debt must be drawn from the people by taxation, and we are annually making drafts upon the people far in excess of the actual needs of the Government. This surplus war taxation is taken from the re-

productive industries, from the wages or working fund of the country, and every dollar thus taken above the wants of the Government economically and honestly administered, is a dollar too much.

"Let it not be forgotten that there are other taxes bearing heavily upon the shoulders of the people. Faults in legislation and administration by States and municipalities have been followed by a train of evils which will require a degree of prosperity unparalleled in the past to enable the people to reform and repair. Unless this be done, and speedily, bankruptcy and repudiation will be the final result. This is especially true of some of the States of the South, whose credit is pledged for tens of millions of dollars, the proceeds of which have never found their way into their treasury vaults or been applied in such way as to add much to the general wealth and prosperity. Is it just, is it wise, under circumstances such as these, and at a time when industry at the South can not pay its local taxes, to impose upon the people these unnecessary burdens?

"Our municipal debt is scarcely less than the national debt, and having been contracted to a large extent since the war, of necessity bears a heavy burden of interest, and, unlike the national Government, but few cities have the financial credit to refund their debts at a lower rate. The aggregate sum drawn from the people on account of interest on State and municipal debts is a heavy burden upon them.

"There is not a State in the Union in which the legal rate of interest is less than 6 per cent, and in many of the States where money is most needed to aid development 10 per cent is maintained as the ruling rate. The agriculturist, manufacturer, and miner are never able to borrow, even when money is abundant, at less than the legal rate; and when capital is sadly needed at the West and South to move the wheels of industry, it is proposed to take annually from fifty to one hundred millions of the working capital of the country, costing for its use at least 10 per cent per annum, to pay a debt which can be extended indefinitely by the Government at 3 per cent. This may pass for statesmanship, but it can scarcely be called business wisdom. The citizen, as a member of the national community, after all his sacrifices in support of the national credit, must pay his own debt bearing 3 per cent interest by a mortgage loan upon his property or business bearing 10 per cent. It is only necessary to state the proposition to demonstrate its injustice and absurdity.

"Rapid payment of the public debt, when the Government can borrow at the minimum rate while the citizen is required to pay the maximum rate, is an evil and a loss to the citizen, whom the Government is bound by every consideration consistent with financial safety to encourage and protect.

"True financial wisdom requires the refunding of the national debt in very long bonds at

a very low rate of interest. Relieve our oppressed citizens from the heavy burden of war taxes in time of peace, and leave the working capital to fructify in the industries of the people. To this end I favor a 10-40 bond bearing interest at the rate of 3 per cent per annum."

Mr. Williams, of Kentucky: "Mr. President, if we are to fund this debt at all, I am in favor of funding it at the lowest possible rate and at the shortest possible time. If I had my way, I would do exactly for the nation what I would do for myself. I would give my note payable on or before a given day, and before that day arrived pay as much of it as I possibly could. That relates to the time. As to the rate of interest, I am perfectly satisfied that the whole of this debt can be easily floated and kept up at 3 per cent if we were to reverse the option to pay at twelve months from date. The national banks could absorb the whole of this entire amount; and if you were to put it at 2 per cent, or 1 per cent instead of $3\frac{1}{2}$ per cent, they would take the whole of it.

"Now give them $3\frac{1}{2}$ per cent, and what does it amount to? It gives to the banks 30 per cent on their capital invested. There is no analogy between the consols of Great Britain and the bonds of the United States. Those consols are taxed to support the Government; the bonds of the United States are not taxed, neither the bonds themselves nor the interest, nor the income accruing from them. Then in this country these bonds are the basis of the circulating medium. A banker takes \$100,000 of bonds to the Treasury when he wants to extend the capital of his bank, and they give him \$90,000 of circulating money just as good as he paid for the bonds themselves. He then is out but \$10,000, and at 3 per cent it brings him 30 per cent per annum. Does any man doubt that the banks will take all these bonds? They need them all; they must take them all. They must take them at 1 per cent as well as at $3\frac{1}{2}$. Why should you pay $3\frac{1}{2}$ per cent? It is a bonus to the banks; it is a bounty to the capital of the country. Gentlemen may talk about subsidies and bounties, but here is a subsidy or a bounty that we are proposing to the moneyed interests of the country. Why, sir, there is in the city of New York alone capital enough to absorb this \$650,000,000. There is a demand around the bourse in New York for cash every day absolutely sufficient to absorb the whole of this \$650,000,000 if the banks do not take a dollar of it. Does any man doubt that? Why, look at the clearances every week in New York at the clearing-houses; in a single week they amount to more than the whole of the bonds that we propose to put on the market. Can they have any better security for the short loans that they need for their speculations, for use at the exchanges, for the purchase and sale of stocks, than these bonds? And can you doubt that they will be readily taken in a week? My word for it, they will all be taken in a single week. There will not be

a bond on the market one week after we pass the law and arrangements are made to issue them.

"I am opposed to the whole scheme of extending this debt of the country. I think what is good policy for the father of a family is good policy for the nation. If I believed I was about to die, the first thing I would do would be to leave my estate so that my children could get it; I would want to leave it clear to my children, without a debt upon it, without a mortgage upon it; and as a Senator of the United States legislating for my posterity and your posterity and future generations, I would be glad to do as much of the work as possible to pay off the whole of the debt while I live, and I hope to see it paid, and I believe I shall see it paid before I die. We shall have a surplus in the Treasury of more than \$110,000,000 next year; we shall have more than that the year after; and in ten years from to-day, if the same economical policy is pursued that is now being pursued, we shall have a surplus revenue to apply upon the debt of more than \$200,000,000 a year.

"Therefore, sir, I am opposed to this amendment adding one half per cent to the rate of interest fixed in the House bill. Suppose we do not negotiate this bond, what harm will be done? Suppose the banks refuse—but they will not refuse—we can just issue Treasury notes and pay off the whole and take their circulation, cancel their bonds, and save the country \$400,000,000. That is what we can do. Give to these bonds and give to these Treasury certificates that you issue the power of paying duties at the custom-house, and they will be at par with gold to-morrow. Your greenbacks would have been at par years ago if you had made them receivable at the custom-house for public dues. Who doubts that? What Senator on this floor doubts that?

"I did not rise to make a speech, but just to enter my solemn protest against the impending amendment. I will vote against this increase of the interest. I will vote for the bill as it came from the House. I may have something to say upon another amendment as to the fifth section, but I care not to say more on this now. I am for the shortest time and the lowest possible rate of interest suggested, because I am perfectly satisfied, not only from my own opinion and judgment, but from that of the ablest bankers in the United States, that these bonds will be greatly sought after and caught up in less than a fortnight after we shall have passed this bill."

Mr. Voorhees, of Indiana: "Mr. President, it was not my purpose until a few hours ago to take part in this debate. It has been, and still is, my intention to assist in making as good a funding bill as possible, with as much benefit and as little evil to the people in it as can be procured in such a measure. Whether I shall finally vote for it or not will depend upon its condition when a vote is reached upon its pas-

sage, after all amendments have been considered. A low rate of interest on bonds of brief duration, with no discrimination in favor of national banks, will, in my judgment, make the best funding law attainable.

"The amendment offered by the Senator from Texas [Mr. Cooke], together with some things which have fallen from other Senators, have induced me to change my purpose of remaining silent. The amendment of the Senator from Texas relates to a subject of great importance to the American people. Its object, if I understand it correctly, is to protect the greenback currency now in circulation from possible destruction under the operations of the pending bill. With that object, it is perhaps needless for me to say, I deeply and earnestly sympathize, and I embrace the opportunity presented by that wholesome amendment to express my views of its propriety and necessity.

"Sir, it is now something more than a year since a needless, uncalled-for, and alarming financial agitation sprang up, instigated by associated bankers and capitalists, in favor of the wholesale destruction of the entire legal-tender note or greenback currency of this country. The systematic efforts made in the same interest to force a resumption of specie payments on a gold basis alone are fresh in the minds of all. By the act of 1873 silver was destroyed as money, and by the act of 1875 provision was made for the retirement and destruction of legal-tender notes until they were contracted within the reach of a gold basis for the purposes of redemption. This policy was the most baneful and truly infernal one ever inflicted upon the people of this country. The memory of it starts afresh the curses of its victims. It destroyed all values both of property and labor. It bankrupted millions of honest people, deprived laboring men and women of a chance to earn bread, drove thousands and tens of thousands to vice and crime, filled the prisons with despairing inmates, and stained the earth with the blood of suicide and murder. This is the true record of the years between 1873 and 1878. The patience of the people at last gave way. They turned upon this accursed policy of destroying money, the measure of all values, and broke it down. The year 1878 is one long to be remembered by the laboring people of this country. In that year they gained the only victories they have had on the financial question since the Republican party came into power, nearly twenty years ago. On the 28th day of February, 1878, the Congress of the United States, by an overwhelming vote over the veto of the President, restored the old American silver dollar to coinage and circulation.

"The struggle here was protracted and determined. The advocates of the gold basis, the monometallists, the adherents of silver demonetization, filled the country with predictions of the evils which would flow from its restora-

tion. No act of Congress, however, has ever given greater satisfaction to the masses, irrespective of party, their only regret being that it did not go far enough; that it did not place the coinage of silver on the same free and unlimited basis with gold. In my judgment, this defect of the law will be cured at no distant day. But the work of financial reform in 1878 did not stop with the restoration of silver money. By the act of May 31, 1878, the further destruction and contraction of greenbacks was prohibited. They were recognized by this legislation as a permanent part of our currency. They were no longer left to the caprice or interested motives of their enemies. The business world took notice of this fact, and their credit rose at once. Under the apprehension of being compelled to do so by law, the Secretary of the Treasury agreed to receive them in payment of customs duties on imports, and they immediately took their place in the money markets at par with gold. On this fact is based the claim that specie payments have been resumed. I am glad to know that the Senator from Delaware [Mr. Bayard] looks upon this claim of specie resumption as I do, for it is a pleasure to concur with him whenever I can. In the opening sentences of his speech of January 27, 1880, he says there is no actual resumption of specie payments at this time, and, after describing the present law on that subject, he declares that 'to resume by such a delusive process is as idle as to bail water with a sieve.'

"It would be difficult, indeed, to describe more forcibly a foolish effort to do an impossible thing. That Senator, I am sure, will therefore agree with me that the revival of business throughout the country is not in any respect due to the so-called resumption of specie payments, when in point of fact such a resumption has not taken place at all. In my judgment the legislation of 1878, legalizing silver money and protecting the greenback currency from further destruction and consequent contraction, did more than all other causes combined to restore confidence in business circles and to bring about whatever degree of prosperity we have since enjoyed. We have had bountiful harvests, it is true, but without financial stability, and without confidence in the quality and amount of money regulated by law, no favorable change would have occurred. The President of the United States, however, at the opening of Congress in December, 1879, and again at the opening of the present session, asked us to undo all we have done on this great subject. In his annual message of December last he strongly urges Congress to authorize the Secretary of the Treasury to suspend the coinage of the silver dollar of 412½ grains; and then with daring hardihood he recommends the retirement from circulation of the entire volume of legal-tender notes, commonly called greenbacks.

"Sir, this is a tremendous issue. It is the boldest attempt at outrage on the people, as it seems to me, in the whole range of our financial history. It is not equaled even by the act of March, 1869; for while that act plunders the tax-payers of hundreds of millions they never agreed to pay, yet its grasp at power was not so great as we are now confronted with. This demand upon us to destroy at one fell blow nearly three hundred and fifty millions of the debt-paying money now in use comes as that of the President, but it is not merely his. It is the demand of more than two thousand national banks organized as the National Bank Association, that Congress shall abandon to them the absolute control of every feature of our financial system. The President in his message simply speaks for them when he attempts to excite distrust against United States notes made by law a legal tender. It is evident they think no money should reach the people except through their own agency. If the greenback currency was swept from existence the banks would have the financial field to themselves, and their currency, with its profits to them and its expense to the people, would soon fill the place of that which had disappeared. This is the vast stake for which the money power now plays. It involves not only millions, but power. It involves the abdication by Congress of all its powers over the currency and the surrender of the whole subject to a moneyed autocracy before which every interest and every department of this Government will be powerless.

"Such corporation wealth and far-reaching financial dominion as that to which the National Banking Association now aspires have hardly a parallel in the history of the world. Is it not time to look to the terms and the principles of the Constitution? In whose hands does that instrument place the power to create a circulating medium for the use of the people? We constantly hear about the duty of driving the financial question out of Congress. To read from day to day the organs of the banks, it would appear to be a usurpation on the part of Congress to consider the question at all. From then it would appear that the Federal Government was entirely incompetent to endow its paper currency with debt-paying functions. Such, too, I understand to be the position of the able chairman of the Finance Committee of this body.

"Let us examine briefly and see whether the founders of this Government did in fact fetter its hands and cripple its powers to the extent claimed. In all governments among men sovereign power is lodged somewhere. There is always a place beyond which you can go no farther. In the words of William Pitt, in the House of Commons, in 1799: "In every government there must reside somewhere a supreme, absolute, and unlimited authority." Sovereignty is rightfully claimed on some subjects by the States of this Union, and with equal

justice by the Federal Government on other subjects. Each has a limited sphere of sovereignty beyond which it can not go. Each has prescribed bounds, and there must stop. But with the people, back of all Federal and State governments, is lodged the supreme, absolute, and unlimited authority from which emanate all constitutions, laws, and policies. They can bind and they can loosen. They made the government of the States, and they made the Federal Government. Chief-Justice Marshall, the master mind of American jurisprudence, in deciding the case of *McCulloch vs. The State of Maryland*, says:

"The Government of the Union, then (whatever may be the influence of this fact on the case), is emphatically and truly a Government of the people. In form and in substance it emanates from them. Its powers are granted by them, and are to be exercised directly on them and for their benefit.

"The great purposes for which the people created the Government of the Union are also specifically declared. In the decision just cited, Chief-Justice Marshall again says:

"The Government proceeds directly from the people, is ordained and established in the name of the people, and is declared to be ordained in order to form a more perfect union, establish justice, insure domestic tranquillity, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity.

"With these purposes in view—purposes as beneficent, as vast, far-reaching, and glorious as ever sustained the hopes of the human race—did the framers of that sacred instrument, the Constitution, make a close and narrow limitation of the means by which to carry them out? We have heard much, throughout all our history, of strict constructionists of the Constitution. I hope and believe that I belong to that party. I am in favor, however, of strictly construing the Constitution for the accomplishment of the great and declared ends of Government, rather than for their defeat. I believe the power to carry out and establish these ends is vested by the Constitution in the Government of the United States. By the last clause of section 8 of the first article of the Constitution it is declared that Congress shall have power—

"To make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this Constitution in the Government of the United States, or in any department or officer thereof.

"That is a broad and sweeping provision, and it has been held to bestow a wide discretion upon Congress in the selection of the necessary and proper means with which to execute the powers of the Government and to fulfill the purposes of its creation. The decision of the present Supreme Court of the United States, in 12 Wallace, holding the laws creating legal-tender notes to be constitutional on the ground that such a currency was necessary for the preservation of the Government, has been harshly criticised. The Senator from

Delaware, in his speech of more than a year ago, saw proper to say:

"Nor do I care now to recite the sad history of the overthrow of one of the most deliberate decisions ever reached by the Supreme Court, accomplished so speedily by the active interference and power of President Grant and Mr. Hoar, his Attorney-General, by the change not in the opinion but in the *personnel* of the tribunal, and an increase in its numbers. . . . On May 1, 1871, this decision was overruled by the reconstructed court by a vote of 5 to 4, and their judgment is to be found in the twelfth volume of Wallace's Reports.

"Sir, the Senator might have spared the Supreme Court his grave censure. Every principle of law as to the power of Congress found in 12 Wallace, upholding the constitutionality of the legal-tender acts of 1862 and 1863, is to be found in 4 Wheaton, in the case of *McCulloch vs. The State of Maryland*, enunciated by Chief-Justice Marshall in 1819, now more than sixty years ago.

"All there is of the question of power is stated on page 421 of 4 Wheaton:

"We admit—

"Says Chief-Justice Marshall—

"as all must admit, that the powers of the Government are limited, and that its limits are not to be transcended. But we think the sound construction of the Constitution must allow to the national Legislature that discretion, with respect to the means by which the powers it confers are to be carried into execution, which will enable that body to perform the high duties assigned to it in the manner most beneficial to the people. Let the end be legitimate, let it be within the scope of the Constitution, and all means which are appropriate, which are plainly adapted to that end, which are not prohibited, but consist with the letter and spirit of the Constitution, are constitutional.

"Under the doctrine here laid down, the issue of legal-tender notes in 1862 and 1863 was left by the Constitution to the discretion of Congress, to be decided by that body in view of all the facts then before it. This ruling indeed makes the power of Congress depend on a question of fact.

"The Government in 1862 and 1863 was striving to maintain its own existence. Was that end legitimate and within the scope of the Constitution? It had to support great armies in the field and equip fleets on the ocean to insure self-preservation. Was the legal-tender note currency an appropriate means of assistance for that purpose? Was it adapted to the service it was expected to perform? Was it a necessary and proper means to a legitimate end? If so, it was a constitutional currency unless prohibited by the letter or the spirit of the Constitution. It is not pretended that such a prohibition exists in terms. Is it prohibited by the spirit of the Constitution, or by any implication arising out of any of its provisions? We are all familiar with the argument on this point. Because the Constitution gives to Congress the power 'to coin money and regulate the value thereof and of foreign coins' it is insisted that the power to make money out of anything that can not be actu-

ally coined is excluded. But those who take this position, and urge a technical construction, can not themselves adhere to the term 'coin' without giving it an explanation which does not appear in the Constitution. The Constitution does not speak of the coinage of gold or silver. All kinds of metals may be coined. Iron, zinc, lead, and all other metallic substances might be used to comply with the mere verbal phrase of the Constitution. Nor does the Constitution expressly authorize Congress to declare any kind of money, even gold and silver, a legal tender. These facts show that in order to restrict the term 'coin' to the precious metals, instead of allowing it to apply to all metals, and in order to give Congress the power to declare them a legal tender, we have to go outside of the express words of the Constitution to obtain its meaning.

"Nobody questions that so far as the coinage of metal money is concerned no other substances except gold and silver can be coined, and yet the Constitution does not say so. Nobody questions that Congress can make gold and silver a legal tender, and yet the Constitution is silent on that point. If, therefore, so much of the power of Congress over the question of money, on points where there has never been any dispute, is derived from inferences arising out of the Constitution, rather than from expressions to be found in it, might we not with safety apply the same rule to the matter that is in controversy? I do not believe that the power of Congress is exhausted by the mere coinage of metallic money. Let it be understood that all money is created by law, and that all power to declare what shall be money is vested in Congress. The Supreme Court of the United States says:

"If the power to declare what is money is not in Congress, it is annihilated.

"It is expressly taken away from the States. Section 10 of the first article of the Constitution provides that—

"No State shall enter into any treaty, alliance, or confederation; grant letters of marque and reprisal; coin money; emit bills of credit; make anything but gold and silver coin a tender in payment of debts; pass any bill of attainder, *ex post facto* law, or law impairing the obligation of contracts, or grant any title of nobility.

"This is a sweeping prohibition of the exercise of power by the States. It is a total negative, and, taken in connection with the affirmative grant of power on this subject, it demonstrates the original purpose to confer upon Congress a full and complete power over the currency of the people. There is one feature in this prohibitory clause of the Constitution more suggestive than any other. The power to make anything but gold and silver a legal tender in payment of debts is expressly denied to the States, but not to Congress. The subject was before the minds of the framers of the Constitution; they considered it; and the fact that they denied to the States, in express

words, the power to make paper money a legal tender, and were totally silent as to the power of Congress on that subject, is a strong implication in favor of that power in Congress. This implication is greatly strengthened, too, when we reflect that the power of Congress to make gold and silver a legal tender in payment of debts is also an implied power, and not an express grant. If it was the intention of the framers of the Constitution that Congress should not have the power to make anything but the precious metals a legal tender, how easily, how certainly, how inevitably would they have inserted such a provision when they were treating of that very question! Would they have used express language in order to deprive the States of this power, while Congress, to whom every vestige of power over money was transferred, was left untrammelled, unless it was their design to permit Congress a discretion on the subject? If it is said that this is a Government of delegated powers, and that while the power to make anything but gold and silver a legal tender was prohibited to the States, yet it was not delegated to the United States, the answer is, that neither was the power to make gold and silver a legal tender expressly delegated to the United States. So that if by reason of its full general control of the question of money Congress derives a power, unexpressed in the Constitution, to declare what shall be a legal tender in the payment of debts, what is there to confine it merely to the precious metals? On this point the reasoning of the Supreme Court, to my mind, is just and unanswerable. It is found on page 546 of 12 Wallace, and is as follows:

"Why, then, it may be asked, if the design was to prohibit to the new Government, as well as to the States, that general power over the currency which the States had when the Constitution was framed, was such denial not expressly extended to the new Government as it was to the States? In view of this it might be argued with much force that when it is considered in what brief and comprehensive terms the Constitution speaks, how sensible its framers must have been that emergencies might arise when the precious metals (then more scarce than now) might prove inadequate to the necessities of the Government, and the demands of the people; when it is remembered that paper money was almost exclusively in use in the States as the medium of exchange, and when the great evil sought to be remedied was the want of uniformity in the current value of money, it might be argued, we say, that the gift of power to coin money and regulate the value thereof was understood as conveying general power over the currency, the power which had belonged to the States and which they surrendered. Such a construction, it might be said, would be in close analogy to the mode of construing other substantive powers granted to Congress. They have never been construed literally, and the Government could not exist if they were. Thus the power to carry on war is conferred by the power to declare war. The whole system of the transportation of the mails is built upon the power to establish post-offices and post-roads. The power to regulate commerce has also been extended far beyond the letter of the grant. Even the advocates of a strict literary construction of the phrase 'to coin money and regulate the value thereof,' while insisting that it

defines the material to be coined as metal, are compelled to concede to Congress large discretion in all other particulars. The Constitution does not ordain what metals may be coined, or prescribe that the legal value of the metals when coined shall correspond at all with their intrinsic value in the market, nor does it even affirm that Congress may declare anything to be a legal tender for the payment of debts. Confessedly the power to regulate the value of money coined, and of foreign coins, is not exhausted by the first regulation. More than once in our history has the regulation been changed without any denial of the power of Congress to change it, and it seems to have been left to Congress to determine alike what metal shall be coined, its purity, and how far its statutory value as money shall correspond from time to time with the market value of the same metal as bullion. How, then, can the grant of a power to coin money and regulate its value, made in terms so liberal and unrestrained, coupled also with a denial to the States of all power over the currency, be regarded as implied prohibition to Congress against declaring Treasury notes a legal tender, if such declaration is appropriate and adapted to carrying into execution the admitted powers of the Government?

"But it has been strenuously insisted on this floor that the obligation of contracts was impaired by the passage of the legal-tender acts, as they are known, of 1862 and 1863. Even if this position could be sustained, it is not clear that it would render them unconstitutional. The States are prohibited from making any 'law impairing the obligation of contracts.' Is that true, however, as to Congress? We do not find it so in the language of the Constitution; neither do we find it in the practices of the Government. What is a general bankrupt law except a provision by which contracts may not only be impaired but abrogated, totally destroyed? A bankrupt law applies to all contracts, past and future, and provides legal methods for their entire obliteration. It may be said that the power is expressly granted in the fourth clause of section 8, Article I of the Constitution to enact a general bankrupt law. That is true; but if Congress is prohibited from impairing, under any circumstances, the validity of contracts, how can two such antagonistic principles stand together in the same instrument? Congress can declare war, before whose blasts contracts are withered and blown away. Congress can pass non-intercourse acts, and enforce embargoes by which contracts may be hindered, impaired, and annulled. But I am very far from admitting that the legal-tender acts do impair the obligation of contracts, whatever the power of Congress may be on that subject. The argument on this point, however, can of course apply only to contracts made prior to February, 1862. All contracts made since the passage of the first legal-tender act have been made with reference to the existence of the legal-tender note currency.

"The complaint in regard to contracts prior to February, 1862, is that a man who owed a debt at that time might afterward pay it in legal-tender notes, or greenbacks, as they are popularly styled, and that his creditor had to take them. Was this an impairment of an or-

dinary contract to pay money, in which there was no mention of any special kind of money, and in the discharge of which both parties simply contemplated the use of the lawful money of the country? I say it was not. Numerous decisions of the Supreme Court of our own country, and of the highest courts of all other civilized countries, might be cited to show that 'the obligation of a contract to pay money is to pay that which the law shall recognize as money when the payment is to be made.' Every contract is made subject to the power of the Government to enact new laws and to repeal old ones. All human conduct is governed by the same rule. We all take the risk of not only what the law now is, but of what it hereafter may be. This is a risk which every citizen shares at every step and on every conceivable subject. The legal-tender acts are not the only financial hazards the American people have encountered in the way of a change of laws. The acts of Congress regulating the coinage of gold and silver have been repeatedly altered and amended. The number of grains of gold in the gold eagle was reduced 6 per cent in 1834, without changing its legal-tender value. The same thing has been done more than once with silver coin, and it has never been contended that such legislation impaired the obligation of contracts. The position assumed by the Supreme Court on this point is the only one which can be upheld. It is stated on page 548 of 19 Wallace, as follows:

"It is true that under the acts a debtor, who became such before they were passed, may discharge his debt with the notes authorized by them, and the creditor is compelled to receive such notes in discharge of his claim. But whether the obligation of the contract is thereby weakened can be determined only after considering what was the contract obligation. It was not a duty to pay gold, or silver, or the kind of money recognized by law at the time when the contract was made, nor was it a duty to pay money of equal intrinsic value in the market. (We speak now of contracts to pay money generally, not contracts to pay some specifically-defined species of money.) The expectation of the creditor and the anticipation of the debtor may have been that the contract would be discharged by the payment of coined metals, but neither the expectation of one party to the contract respecting its fruits, nor the anticipation of the other, constitutes its obligation. There is a well-recognized distinction between the expectation of the parties to a contract and the duty imposed by it. (*Speden vs. Austin*, 5 Adolphus and Ellis, N. S., 671; *Dunn vs. Sayles*, *Id.*, 685; *Collin vs. Landis*, 10 Wright, 426.) Were it not so, the expectation of results would be always equivalent to a binding engagement that they should follow. But the obligation of a contract to pay money is to pay that which the law shall recognize as money when the payment is to be made. If there is anything settled by decision it is this, and we do not understand it to be controverted. (*Davies*, 28; *Barrington vs. Potter*, Dyer 81, b. fol. 67; *Faw vs. Marsteller*, 2 Cranch, 29.) No one ever doubted that a debt of \$1,000 contracted before 1834 could be paid by one hundred eagles coined after that year, though they contained no more gold than ninety-four eagles such as were coined when the contract was made; and this, not because of the intrinsic value of the coin, but because of its legal value. The eagles coined after 1834 were not money until they were authorized by law; and had they been coined before without a law fixing

their legal value, they could no more have paid a debt than uncoined bullion, or cotton, or wheat. Every contract for the payment of money simply is necessarily subject to the constitutional power of the Government over the currency, whatever that power may be, and the obligation of the parties is therefore assumed with reference to that power.

"In the discussion of this great question, however, we have always heard much stress laid on what have been termed the 'war powers' of the Constitution. There are those who, while admitting that Congress has the power to make legal-tender notes, still insist that such power only exists during war. They hold that a state of war gives rise to a power in the Constitution, and confers it upon Congress, over the currency of the country, which has no existence in time of peace. It is certainly true that great war powers belong to this Government. But is the power on the part of Congress to create a legal-tender note circulation for the people one of them? That is the plain question. The powers of Congress on the subject of war are specifically named in the Constitution. It may be profitable to read them.

"To declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water;

"To raise and support armies, but no appropriation of money to that use shall be for a longer term than two years;

"To provide and maintain a navy;

"To make rules for the Government and regulation of the land and naval forces;

"To provide for calling forth the militia to execute the laws of the Union, suppress insurrection, and repel invasions;

"To provide for organizing, arming, and disciplining the militia, and for governing such part of them as may be employed in the service of the United States, reserving to the States, respectively, the appointment of the officers, and the authority of training the militia according to the discipline prescribed by Congress.

"Sir, if the power of Congress, or any part of it, over the currency is derived from the grants of the Constitution in relation to war, it must be found somewhere in the clauses which I have just read. They contain all the power which has been given to Congress on the subject of war. Those who contend that the legal-tender notes are constitutional in war, but not in peace, claim that their argument is sustained by the two clauses just quoted:

"To raise and support armies, but no appropriation of money to that use shall be for a longer term than two years;

"To provide and maintain a navy.

"They contend that the power to raise and support armies and to provide and maintain a navy implies the power to resort to an issue of legal-tender notes if necessary. It is clear to my mind that in these clauses the framers of the Constitution were providing a power in Congress for the appropriation of money for the support of our military and naval forces rather than for a power to create money to be appropriated. The same sentence which provides for raising and supporting armies treats

of appropriations of money for that purpose, and limits the time for which they may be made. The thought connected with that clause of the Constitution at the time it was written, so far as money was concerned, evidently dwelt on the power to appropriate money from the Treasury, and not upon the power of Congress to declare what should be the money of the country. The truth is that the power of Congress over the currency is far broader than all the war powers of the Constitution combined. War is not the chief pursuit of this Government, nor of any other, except a government of savages. War is not the only condition in which the American people may need financial relief. Peace may have its financial emergencies as well as war. Peace, the friend of industry, the promoter of trade, the builder of cities, the patron saint of commerce; peace, the best gift of God to nations and to men; why should it have less power in the Constitution with which to execute the purposes of the Government than war? Why should the long reign of peace be less able to preserve the Government and to promote the general welfare than the brief periods of strife and bloodshed?

"Sir, Chief-Justice Marshall did not speak of a time of war or a time of peace, but for all times and for all conditions of public affairs, when he said that—

"The sound construction of the Constitution must allow to the national Legislature that discretion, with respect to the means by which the powers it confers are to be carried into execution, which will enable that body to perform the high duties assigned to it in the manner most beneficial to the people.

"This principle here laid down by the mighty mind of Marshall recognizes in Congress, in the immediate representatives of the people, the power, without respect to a condition of peace or war, to adopt such measures as in their judgment are best calculated to promote the general welfare, provided simply that the measures adopted are not prohibited by the Constitution and are consistent with its letter and its spirit. I think I have shown that the power to make paper currency a legal tender in payment of debts is not prohibited to Congress by the Constitution, neither by the letter nor by the spirit of that instrument. No conclusion of law was ever plainer to me than that such a power exists at all times, subject to be exercised by Congress in its wisdom and in its discretion. The necessity for the exercise of the power is left wholly with Congress. Chief-Justice Marshall, in *McCulloch vs. The State of Maryland*, again says:

"But where the law is not prohibited, and is really calculated to effect any of the objects intrusted to the Government, to undertake here to inquire into the degree of its necessity would be to pass the line which circumscribes the judicial department and to tread on legislative ground. This court disclaims all pretensions to such a power.

"It is a satisfaction to know that the Supreme Court in making its decision on this subject, in *twelfth Wallace*, made no claim

that the power of Congress to authorize legal-tender notes was derived in any respect from the war powers of the Constitution. All concede that it is a power not to be exercised needlessly; neither is any other power of Congress to be exerted without reason. But of the occasion when the public good or the safety of the Government calls for its exercise, the Congress itself is the judge, subject only to the limitations heretofore stated.

"But, sir, aside from the Constitutional power of Congress, to make this kind of currency a legal tender, it is now vehemently insisted in certain quarters that its legal-tender quality has been from the first injurious to the best interests of the country. It is absolutely urged that the power to pay debts with this currency, standing firmly the equal of gold if not better, is a great and dangerous evil to the people. It is in daily use at this hour in all the transactions of life, from the most minute to the most extensive, from the purchase of a night's lodgings to the purchase of a railroad, or a line of ships. It is now transacting the business of every neighborhood, every village, and every city in the United States. It has been the basis of all contracts among the people for the last eighteen years. It is the measure now, at this very moment of time, of the obligation of parties to nine hundred and ninety-nine contracts out of every thousand in existence. Yet we are asked to believe that the legal-tender quality of this money, that quality which enables a party to pay a debt contracted with reference to it, is injurious to the public interests, and ought at once to be withdrawn. It has even been claimed that the money would be better without such quality, and that it would still circulate, with increased vigor and usefulness, after it had received the fatal blow aimed at it by its enemies.

"As well might you expect a man to walk erect through this hall after his heart had been taken from his body. The Senator from Delaware, on a former occasion, in strong, figurative language, said, 'This assumed legal-tender power is like the germ of a deadly fever.' He said he would destroy that germ without delay. Rather is the legal-tender power of our currency like the benignant action of the human heart, carrying a healthy and an indispensable circulation to the remotest extremities.

"Sir, I shall in a few moments take leave of this great question for the present. I have detained the Senate longer than I desired, but, as a member of the Committee on Finance, I have conceived it my duty to submit the reasons which govern my action. Let no one suppose that the financial question will disturb us here no more. The holders of amassed capital are grasping for additional power, and this question will come again and again as long as human cupidity can spy out new fields of profit to occupy, and new bounties and still

further special privileges to demand from the labor of the people. A vast money corporation, the most gigantic on earth, is aiming to centralize within itself all the powers of this Government over the currency, and, consequently, over the entire trade and business of the American people. That corporation, the National Bank Association, possesses already a combination of powers inconsistent with the safety of free government, and we have seen it within the past year clutch at all the remaining powers connected with the subject of the finances. The holders of privileged capital are also uttering their battle-cry for the future. Their demand for a strong government is now heard on every hand. No one need mistake their meaning. A strong government, in their estimation, is one in which the people are deprived as far as possible, and the farther the better, of all power to control public affairs. A call for a strong government to-day in our midst has the same meaning it has had in all the ages of the past—a government of the privileged few. Sir, I too am in favor of a strong government, but the strength which I wish my government to have is to be found only in the hearts of a free, self-governing people, inspired with a love of country because of its just and equal laws. On such a foundation no government can be overthrown; on any other, no government ought to stand."

The Presiding Officer: "Shall the amendments be engrossed and the bill be ordered to a third reading?"

The amendments were ordered to be engrossed, and the bill to be read a third time.

The bill was read the third time.

The result was announced as follows:

YEAS—Bailey, Bayard, Beek, Booth, Brown, Butler, Call, Cockrell, Coke, Davis of Illinois, Eaton, Farley, Garland, Groome, Grover, Hampton, Harris, Hereford, Hill of Georgia, Ingalls, Johnston, Jonas, Kernan, Lamar, McDonald, McPherson, Maxey, Morgan, Pendleton, Plumb, Pugh, Saulsbury, Saunders, Slater, Thurman, Vance, Vest, Voorhees, Walker, Wallace, Whyte, Williams, Withers—43.

NAYS—Allison, Anthony, Baldwin, Blair, Burnside, Cameron of Wisconsin, Dawes, Ferry, Hamlin, Hill of Colorado, Hoar, Kirkwood, Logan, McMillan, Morrill, Paddock, Platt, Rollins, Teller, Windom—20.

ABSENT—Blaine, Bruce, Cameron of Pennsylvania, Carpenter, Conkling, Davis of West Virginia, Edmunds, Jones of Florida, Jones of Nevada, Kellogg, Randolph, Ransom, Sharon—13.

So the bill was passed.

In the House, on February 18th, the refunding bill was considered.

Mr. Tucker, of Virginia: "I ask consent that House bill No. 4592, to facilitate the refunding of the national debt, which has been returned from the Senate with amendments, and is now on the Speaker's table, be printed with the Senate amendments in regular bill form."

There was no objection, and it was so ordered.

The bill, with Senate amendments, is as follows: [Strike out the parts in brackets, and insert the parts printed in italics.]

An act to facilitate the refunding of the national debt.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That all existing provisions of law authorizing the refunding of the national debt shall apply to any bonds of the United States bearing a higher rate of interest than 4½ per cent per annum which may hereafter become redeemable: *Provided*, That in lieu of the bonds authorized to be issued by the act of July 14, 1870, entitled "An Act to authorize the refunding of the national debt," and the acts amendatory thereto, and the certificates authorized by the act of February 26, 1879, entitled "An Act to authorize the issue of certificates of deposit in aid of the refunding of the public debt," the Secretary of the Treasury is hereby authorized to issue bonds (1) [in the] *to an amount* (2) [of] not exceeding \$400,000,000, (3) *of denominations of \$50, or some multiple of that sum*, which shall bear interest at the rate of 3 per cent per annum, (4) *payable semi-annually*, redeemable, at the pleasure of the United States, after 5 years, and payable (5) [ten] *twenty years from the date of issue*; and also (6) [certificates in the] *Treasury notes to an amount* (7) [of] not exceeding \$300,000,000, in denominations of ten (8) [twenty, and fifty] dollars, (9) *or some multiple of that sum not exceeding \$1,000*, either registered or coupon, bearing interest at (10) [the] *a rate* (11) [of] not exceeding 3 per cent per annum, (12) *payable semi-annually*, redeemable at the pleasure of the United States, after one year, and payable in ten years from the date of issue (13); *and no Treasury note of a less denomination than \$100 shall be registered*. The bonds and (14) [certificates] *Treasury notes* shall be, in all other respects, of like character and subject to the same provisions as the bonds authorized to be issued by the act of July 14, 1870, entitled "An Act to authorize the refunding of the national debt," and acts amendatory thereto: *Provided*, That nothing in this act shall be so construed as to authorize an increase of the public debt: *Provided further*, That interest upon the 6 per cent bonds hereby authorized to be refunded shall cease at the expiration of thirty days after (15) *publication of notice that the same have been designated by the Secretary of the Treasury for redemption*. (16) *It shall be the duty of the Secretary of the Treasury, under such rules and regulations as he may prescribe, to authorize public subscriptions, at not less than par, to be received at all depositories of the United States, and at all national banks, and such other banks as he may designate, for the bonds and for the Treasury notes herein provided for, for thirty days before he shall contract for or award any portion of said bonds or Treasury notes to any syndicate of individuals or bankers, or otherwise than under such public subscriptions; and if it shall happen that more than the entire amount of said bonds and Treasury notes, or of either of them, has been subscribed within said thirty days, he shall award the full amount subscribed to all persons who shall have made bona fide subscriptions for the sum of \$2,000 or less, at rates most advantageous to the United States, and the residue ratably among the subscribers in proportion to the amount by them respectively subscribed, at rates most advantageous to the United States.*

SECTION 2. The Secretary of the Treasury is hereby authorized, in the process of refunding the national debt, to exchange, at not less than par, any of the bonds or (17) [certificates] *Treasury notes* herein authorized for any of the bonds of the United States outstanding and uncalled bearing a higher rate of interest than 4½ per cent per annum; and on the bonds so redeemed the Secretary of the Treasury may allow to the holders the difference between the interest on such bonds from the date of exchange to the time of their maturity, and the interest for a like period on the bonds or (18) [certificates] *Treasury notes* issued; (19) [but none of the provisions of this act shall apply to the redemption or exchange of any of the bonds issued to the Pacific Railway Companies;] and the bonds so received and exchanged in pursuance of the provisions of this act shall be canceled and destroyed; (20) *but*

none of the provisions of this act shall apply to the redemption or exchange of any of the bonds issued to the Pacific Railway Companies.

SEC. 3. (21) [Authority to issue bonds and certificates to the amount necessary to carry out the provisions of this act is hereby granted; and] The Secretary of the Treasury is hereby authorized and directed to make suitable rules and regulations to carry this act into effect (22) [; Provided that:] and the expense of preparing, issuing, advertising, and disposing of the bonds and (23) [certificates] *Treasury notes* authorized to be issued shall not exceed (24) [one quarter] *one half* of 1 per cent.

SEC. 4. That the Secretary of the Treasury is hereby authorized, if in his opinion it shall become necessary, to use (25) *temporarily* not exceeding \$50,000,000 of the standard gold and silver coin in the Treasury in the redemption of the 5 and 6 per cent bonds of the United States authorized to be refunded by the provisions of this act, (26) *which shall from time to time be repaid and replaced out of the proceeds of the sale of the bonds or Treasury notes authorized by this act*; and he may at any time apply the surplus money in the Treasury not otherwise appropriated, or so much thereof as he may consider proper, to the purchase or redemption of United States bonds or (27) [certificates] *Treasury notes authorized by this act: Provided, That the bonds and (28) [certificates] Treasury notes so purchased or redeemed shall constitute no part of the sinking fund, but shall be canceled.*

SEC. 5. From and after the 1st day of (29) [May] *July, 1881, the 3 per cent bonds authorized by the first section of this act shall be the only bonds receivable as security for national-bank circulation, or as security for the safe-keeping and prompt payment of the public money deposited with such banks; but when any such bonds deposited for the purposes aforesaid shall be designated for purchase or redemption by the Secretary of the Treasury, the banking association depositing the same shall have the right to substitute other issues of the bonds of the United States in lieu thereof: Provided, That no bond upon which interest has ceased shall be accepted or shall be continued on deposit as security for circulation or for the safe-keeping of the public money; and in case bonds so deposited shall not be withdrawn, as provided by law, within thirty days after interest has ceased thereon, the banking association depositing the same shall be subject to the liabilities and proceedings on the part of the Comptroller provided for in section 5234 of the Revised Statutes of the United States: And provided further, That section 4 of the act of June 20, 1874, entitled "An Act fixing the amount of United States notes, providing for a redistribution of the national-bank currency, and for other purposes," be and the same is hereby repealed; and sections 5159 and 5160 of the Revised Statutes of the United States be and the same are hereby re-enacted.*

(30) SEC. 6. *That the payment of any of the bonds hereby authorized, after the expiration of five years, shall be made in amounts to be determined from time to time by the Secretary of the Treasury, at his discretion, the bonds so to be paid to be distinguished and described by the dates and numbers, beginning for each successive payment with the bonds of each class last dated and numbered; of the time of which intended payment or redemption the Secretary of the Treasury shall give public notice, and the interest on the particular bonds so selected at any time to be paid shall cease at the expiration of thirty days from the publication of such notice.*

SEC. (31) [6] 7. That this act shall be known as "The funding act of 1881"; and all acts and parts of acts inconsistent with this act are hereby repealed.

The House proceeded to consider the amendments.

Mr. Frye, of Maine: "If the Speaker pleases, the Senate changed May to July. The committee changed July to September. Then the

committee retired from the change from July to September in order to allow the gentleman from Michigan to move the September amendment with another amendment. Now, if the House concurs in the Senate amendment, will the gentleman still have his right of moving to amend by changing that to September and something else? If not, then the gentleman from Michigan could offer his amendment at this point."

The Clerk read as follows:

Amend the fifth section by striking out "July," in the first line, and after the words "provided further," in line twenty and to and including the word "repeal," in line twenty-four; and by inserting the word "September" in the first line in place of the word "July," proposed to be stricken out.

Mr. Frye: "The amendment which the gentleman from Michigan offers is one, in my judgment, in the present condition of public sentiment, of very great importance. Sections 5220, 5221, 5222, and 5224 of the Revised Statutes of the United States provide for the voluntary liquidation of banking corporations. In that voluntary liquidation the bank itself, by the action of a certain number of its stockholders, may, under the law, redeem all its bonds on deposit in the Treasury for its circulation in the lawful currency of the United States; and two of these sections providing for that contingency were the revised acts of June, 1874, referred to in section 5 of this bill.

"Now, the bill proposed by the Committee on Ways and Means, in this section now under consideration, and the amendments proposed by the gentleman from Kentucky, provides for a repeal of that law of June, 1874, and the question meeting this House squarely is simply this: Does that repeal of the law of June, 1874, repeal the right of a national bank to go into voluntary liquidation and redeem its bonds by the use of lawful currency? And, Mr. Speaker, gentlemen are divided, and divided honestly, in their opinion on this subject. Some of the best lawyers in this country to-day are writing to Congress insisting that if the amendment recommended by the gentleman from Kentucky shall prevail, they hold that it will operate as an absolute repeal of all power on the part of the national banks voluntarily to liquidate and redeem their United States bonds deposited with the Secretary of the Treasury as security for circulation by lawful currency. If it does this, if it accomplishes this result, a gross and grave injustice is done to this great interest in this country. If it does not, then the complaint is without foundation. But, sir, a majority of the banking people of the country today fully believe that it does repeal that right.

"Mr. Speaker, why should there be any question about it? Why should it be left open to doubt? Here we are enacting a law touching the most sensitive thing in the world, finance (and gentlemen can see how sensitive a subject it is by observing what has transpired within the last week), and in that enactment we are met with questions of such gravity and

doubt as this. In legislating upon a subject so sensitive as this, why should it be left to a doubt if a single amendment, a few words incorporated in it, or if the English language can make it plain, certain, and unequivocal?

"Sir, the committee, in order to remove all doubt, agreed to an amendment offered by the gentleman from Ohio [Mr. McKinley], providing that nothing in this act shall be construed to affect these sections to which I called the attention of the House.

"But, Mr. Speaker, that very amendment is probably open to the point of order, if any gentleman here should make it; and under a former ruling of the Speaker it is very likely that it might be ruled out. What will be the effect? The friends of the bill reject Mr. Conger's amendment, also reject or have ruled out of order the amendment of the gentleman from Ohio [Mr. McKinley].

"What meaning will you convey to the country? What will be the signification of your action? Do you not give notice, practically, to the banks that they can not liquidate without redeeming their bonds held by the Treasury in their own circulation? By rejecting the McKinley amendment do you not send out word to the country that it is the purpose in framing this bill to prevent the banks from liquidating under the existing provisions of law? That such at any rate is your construction? Sir, I hope this House will do nothing of the kind, but will so amend the law that no man can fail to comprehend readily and understand clearly its provisions."

Mr. Price, of Missouri: "The gentleman from Kentucky [Mr. Carlisle], who has the principal charge of this bill, alleges and has endeavored to make gentlemen upon this side of the House believe, possibly has made gentlemen on that side of the House believe, that you do not intend to repeal the sections referred to by my friend the gentleman from Maine [Mr. Frye], when the last section of his bill provides in terms, not by implication, not by inference, but in terms, that this bill shall be called so-and-so, and that it shall repeal all acts and parts of acts in conflict with this act. And this act provides that you can not get the bonds out of the Treasury of the United States belonging to a bank that has deposited them there for circulation or for security of deposits made with them by the Government unless you deposit your own paper there for them. The section I refer to provides that lawful money may be deposited and these bonds taken up; while this bill says that they must return their own notes; and it would be base flattery not to call a man very foolish—that is as mild as I can put it—who does not know there never was a bank of issue established in this world that ever got in all of its own notes. And, consequently, if they can not get in their own notes, and if they can not get their bonds out any other way than by depositing their notes, they never can get their bonds. In other

words, by this fifth section you say they shall do a certain thing that is morally impossible for them to do. And then you say if they don't do it you will put them into the hands of a receiver under section 5234 of the Revised Statutes; and there is no getting away from that section.

"But the great bugbear about this thing is the cry as to the national banks. They are the troublesome element in this matter. There are gentlemen upon this floor, of intelligence, of integrity, of standing, not only here but at home, who rush to the front with as much velocity and ferocity whenever you name 'national banks' as the wildest bull that ever came from the mountains of Andalusia would rush upon a red flag.

"Oh, it is astonishing. What have the national banks done? They furnished a market for your bonds, and they did it at the solicitation of the Government, instead of your having to send your bonds to Europe, where you would have to send money to pay the coupons for interest accruing on them; and they did it for the purpose of aiding the Government to float its debt. But that is all forgotten, and the hue and cry was raised from one end of the country to the other that it would not do to put power in the hands of a few men."

Mr. Carlisle, of Kentucky: "Mr. Speaker: The fifth section of this bill has been so much misconstrued or so much misrepresented in various parts of the country, that I consider it my duty, notwithstanding the lateness of the hour, to say something in explanation of its provisions. It is not my purpose to enter upon an argument in support of the section except so far as the argument may be necessary to explain the principles upon which it was framed, and to state fully its purpose and effect. It contains four separate and distinct provisions, all relating, however, to the same general subject, and all calculated, in my opinion, to aid materially in the successful inauguration and maintenance of the financial policy advocated by those of us who believe that the outstanding 5 and 6 per cent bonds of the United States should be funded at the minimum rate of interest paid by other first-class nations, and that the national banks should be required to assist in accomplishing this result. In the first place, it provides, as amended in the Senate, that from and after the 1st day of July next the 3 per cent bonds authorized by the bill, and no others, shall be receivable as security for the circulating notes of the national banks, and as security for the safe-keeping and prompt payment of the public money deposited with such banks."

"This is certainly a very plain and simple provision, and it seems to me that it requires much more ingenuity to pervert its true meaning than it does to ascertain it; and yet for a while a persistent attempt was made to convince the public that if this provision should be adopted all national banks having 4 and 4½

per cent bonds on deposit to secure their circulation and public deposits would be compelled after the date named to withdraw them and substitute bonds bearing 3 per cent, or go into liquidation. It is almost impossible to make an argument against such a construction as this; nor is it necessary to attempt it, as it is now conceded, I believe, everywhere, that there was not a shadow of foundation for it. It was one of the devices adopted by interested parties to alarm the banks and to precipitate a resort by them to the exercise of that dangerous power of contraction conferred upon them by the act of 1874; and in connection with other statements equally groundless it actually produced a rapid withdrawal of circulation, which for a few days threatened disaster and ruin to all the business interests of the people.

"Sir, this is not the first effort that has been made in Congress to compel these creatures and agencies of the Government to assist it in reducing the interest charge upon the people, and, if it shall fail now, it will not be the first demonstration of their power over the financial legislation of the country. It is a humiliating confession for the representatives of the people to make, but it is true, nevertheless, that ten years ago, when these institutions were fewer in number than they are to-day, when their organization was less perfect, and when their combined capital was not so great, they had power enough to defeat in this House a provision which was designed by the present Secretary of the Treasury to compel them to aid in funding a large part of the public debt at 4, 4½, and 5 per cent. On the 2d day of February, 1870, Mr. Sherman, as chairman of the Finance Committee in the Senate, reported back to that body, as a substitute for a bill previously introduced by Mr. Sumner, a bill which after some amendments was finally passed and is now known as the funding act of July 14, 1870. The bill as reported by Mr. Sherman provided for the issue and sale of \$400,000,000 of bonds bearing interest at the rate of 5 per cent, \$400,000,000 bearing interest at the rate of 4½ per cent, and \$400,000,000 bearing interest at the rate of 4 per cent; and in order to create a certain market for a large part of these securities it contained in its eighth section the following provisions, which I beg leave to submit for the consideration of gentlemen who have denounced what they have been pleased to call the 'forced loan' feature in the measure now before us. The eighth section of Mr. Sherman's bill was as follows:

"*And be it further enacted*, That on and after the 1st day of October, 1870, registered bonds of any denomination not less than \$1,000, issued under the provisions of this act, and no other, shall be deposited with the Treasurer of the United States as security for notes issued to national-banking associations for circulation under an act entitled "An act to provide a national currency secured by a pledge of United States bonds, and to provide for the circulation and

redemption thereof," approved June 3, 1864; and all national-banking associations organized under said act, or any amendment thereof, are hereby required to deposit bonds issued by this act, as security for their circulating notes, within one year from the passage of this act, in default of which their right to issue notes for circulation shall be forfeited; and the Treasurer and the Comptroller of the Currency shall be authorized and required to take such measures as may be necessary to call in and destroy their outstanding circulation, and to return the bonds held as security therefor to the association by which they were deposited in sums of not less than \$1,000: *Provided*, That any such association now in existence may, upon giving thirty days' notice to the Comptroller of the Currency, by resolution of its board of directors, deposit legal-tender notes with the Treasurer of the United States to the amount of its outstanding circulation and take up the bonds pledged for its redemption: *And provided further*, That no more than one third of the bonds deposited by any bank as such security shall be of either of the classes of bonds hereby authorized on which the maximum rate of interest is fixed at 4½ or 5 per cent per annum."

"The next section provided that the circulating notes which any banking association might receive from the Comptroller of the Currency should not exceed 80 per cent of the par value of the bonds deposited instead of 90 per cent, as they may now obtain under the law.

"It will be observed that the section just read is much more severe in its requirements than anything contained in this bill. It proposed to compel national banks not only to deposit the new bonds and no others as security for circulation after a certain date, but it went further and declared that their right to issue notes for circulation should be absolutely forfeited unless they should within one year withdraw all the old bonds they then had on deposit and substitute the new ones in their places. This was a sweeping and radical provision, which went to the full extent of asserting the absolute power of Congress to legislate according to its own conception of the public interests concerning the character of the bonds that should be deposited or permitted to remain on deposit as security for the circulating notes of these corporations. That such power exists in Congress has been asserted again and again by some of the most eminent men in the country, and by none more frequently or emphatically than Mr. Sherman himself.

"These assertions are sufficient to show that the policy indicated in the first clause of the fifth section of the pending bill is not now presented to the country for the first time, and that the right and duty of Congress to adopt it when in its judgment the interests of the Government and people require it have been asserted and maintained, not only by men of eminent ability as lawyers and large experience in financial affairs, but by a majority of two to one in the Senate when the very first attempt was made to fund our enormous public debt at a reduced rate of interest. It was then insisted—and properly insisted, in my opinion—that those institutions which, in the language of Mr. Sherman, had, prior to 1870, 'made on

the average from 15 to 20 per cent annually upon the franchise derived from the United States,' should be required to contribute their just proportion to the general welfare by receiving and using as a basis for their circulation public securities bearing at least as low a rate of interest as the Government proposed to allow the savings-banks and the trustees and guardians of dependent widows and orphans throughout the country. But, sir, the national banks resisted the reasonable demands of the Government then as they are resisting them now, and the result was that the eighth section of Mr. Sherman's bill was defeated in this House. A committee of conference was appointed, and in lieu of that section it reported the following:

"And be it further enacted, That from and after the passage of this act the Treasurer of the United States shall receive no other than registered bonds issued under the provisions of this act as security for the circulating notes of national-banking associations issued under the act entitled "An act to provide a national currency secured by a pledge of United States bonds, and to provide for the circulation and redemption thereof," approved June 3, 1864, or any act supplementary or amendatory thereof."

"This report was signed by Hon. Robert O. Schenck and Hon. Samuel Hooper on the part of the House, and by Hon. John Sherman, Hon. Charles Sumner, and Hon. Garrett Davis on the part of the Senate. The section in this form—requiring the banks to deposit the new bonds from and after the passage of the act, and not giving them time, as the fifth section of this bill does—received the votes of eighty-eight members of this House, and among them were the gentleman from Michigan [Mr. Conger], the gentleman from Indiana [Mr. Orth], and two gentlemen from Pennsylvania [Mr. Kelley and Mr. O'Neill], all of whom are still members of this body, and all of whom, except one [Mr. Kelley], are now opposing this feature of the bill. The conference report, however, was not agreed to here, and the Senate was compelled at last to recede from its position and allow the bill to become a law without the eighth section or any equivalent provision. When this result became inevitable, by reason of the active and determined opposition of the national banks, Mr. Sherman, who had been from the beginning an earnest and consistent advocate of the justice and policy of the compulsory clause, announced the fact to the Senate in a speech which I commend to the serious consideration of gentlemen who are opposing this clause of the fifth section. After stating that there was 'a very unreasonable and unnecessary clamor raised by the banks against that provision,' he said:

"I wish now to record my deliberate judgment that in this conclusion to which we have been compelled to arrive by the action of the House we are doing the national banks a great injury, which will impair their influence and power among the people, and that the opposition of the national banks to this provision which would have required them to aid in the funding of the public debt will tend more to weaken and de-

stroy them than anything that has transpired since their organization. I do not see how we can go before the people of the United States and ask them to lend us gold at par for our bonds, when we refuse to require agencies of our own creation to take them; when we even refuse to require new banks not yet organized to take these new bonds, and when we refuse to require old banks, which have made on the average from 15 to 20 per cent annually upon the franchise derived from the United States, to aid us to this extent in funding the national debt.

"But, sir, the vote of the House shows the power of the national banks. It is so great, at least in the House, that in order to secure a funding bill we have been compelled to abandon all provisions in regard to the national banks; but I give notice that in the future I for one shall be prepared at all times to require the national banks to take that class of bonds which we propose in this bill, and I have no doubt this will be the result. But for the present, in deference to the wishes of the House, we have withdrawn the section in regard to national banks.

"Now, sir, for the second time since the organization of these institutions the representatives of the people find themselves compelled in the discharge of their public duties to encounter the almost united opposition of more than two thousand corporations of their own creation—opposition to a financial policy already approved by both branches of the legislative department—and thus we are again confronted with the naked question whether Congress or the banks shall finally determine what that policy shall be. What was the primary purpose of the Government in establishing this system in the first instance? If any gentleman entertains a doubt upon this subject, let him read the reports in which Mr. Chase, then Secretary of the Treasury, suggested and recommended the passage of the original national-bank act, and he will be convinced that the principal purpose of that eminent financier was to create a certain demand and reliable market for Government securities. Considered with reference to that purpose, it was unquestionably a wise stroke of financial policy, and it justly won for its author the highest encomiums from ministers of finance in all parts of the world. In fact, the constitutional power of Congress to create these corporations can not be maintained except upon the ground that they were to constitute, when organized, agencies of the Government for certain public purposes.

"Since the celebrated judgment of Chief-Justice Marshall in the case of the United States Bank, no one has ventured to affirm that Congress possesses power under the Constitution to create corporations for the transaction of purely private business or for the sole benefit of private individuals. In order to come within the scope of congressional power they must be created as means or instrumentalities for the execution of some principal power delegated by the Constitution. They must be public agencies, and not mere private associations. The language of the court in the case alluded to is so clear and comprehensive that it is impossible to mistake its meaning. It defines

with the utmost precision the foundation and extent of the power in question, and in so doing necessarily excludes from its operation all cases not coming within the terms of the definition itself. The court said:

"The power of creating a corporation, though appertaining to sovereignty, is not like the power of making war, or levying taxes, or of regulating commerce, a great substantive and independent power, which can not be implied as incidental to other powers or used as a means of executing them. It is never the end for which other powers are exercised, but a means by which other objects are accomplished. . . . The power of creating a corporation is never used for its own sake, but for the purpose of effecting something else. No sufficient reason is, therefore, perceived why it may not pass as incidental to those powers which are expressly given, *if it be a direct mode of executing them.*

"And again the court said:

"We admit, as all must admit, that the powers of the Government are limited, and that its limits are not to be transcended. But we think the sound construction of the Constitution must allow to the National Legislature that discretion, with respect to the means by which the powers it confers are to be carried into execution, which will enable that body to perform the high duties assigned to it, in the manner most beneficial to the people. Let the end be legitimate, let it be within the scope of the Constitution, and all means which are appropriate, which are plainly adapted to that end, which are not prohibited, but consist with the letter and spirit of the Constitution, are constitutional.

"In another place the court, speaking of this same power, said:

"Had it been intended to grant this power as one which would be distinct and independent, to be exercised in any case whatever, it would have found a place among the enumerated powers of the Government. But being considered merely as a means to be employed only for the purpose of carrying into execution the given powers, there could be no motive for particularly mentioning it.

"Congress did not create these banking associations, or have the power to create them, merely for the private emolument of their stockholders, but it established them as agencies of the Government to co-operate with it and assist it in conducting its financial operations. Whatever private gain or profit may accrue to those who see proper to engage in the business of banking under the system is incidental only to the main purpose of the law; or, in other words, the prospect of such gain was the inducement which public policy indicated should be offered in order to make the experiment a success and secure a market for the Government loans.

"Having the express power to borrow money on the credit of the United States, it might well be argued that a national banking system could be created under the authority of congressional legislation as a necessary and proper means to accomplish that object; but this obviously implies that there must be absolute and continued governmental control over the means employed, for otherwise the instrument would become the master, or at least independent of the authority for whose use it was created. If, therefore, there had

been no express reservation of the right to alter, amend, or repeal the national banking law, such right would have necessarily resulted from the nature and objects of the legislation. Its existence would have been just as clear in such a case as in the case of a public office created by statute for the more convenient or effective execution of a State or Federal power. There is no difference in this respect between a public agency and a public office.

"There are no elements of a contract in such legislation, and therefore the extent to which the Government will or ought to go in the exercise of its power of supervision and control is always a question of policy and not a question of power. Now, however, we are told, in effect, that the Government ought no longer to use the national banks for one of the purposes, the principal purpose, of their creation: that to require them to deposit 3 per cent bonds, after a certain date, to secure the circulating notes which the United States furnishes and guarantees would be an act of bad faith; and that it would so diminish the profits realized upon their circulation as to compel them to withdraw it, and thus inflict great injury upon the country by a contraction of the currency. It has not been very long since the policy of contraction was a favorite one with some who now protest most strongly against it, but, having pursued it until it nearly crushed the life out of every legitimate industry in the land, they appear at last to confess, in an indirect way, that it was a mistake. I agree with them that a large contraction of the currency, especially if it be sudden and unexpected, amounts to a public calamity, and I shall endeavor before concluding to show that one of the main purposes of the fifth section of this bill is to make such contraction impossible in the future.

"I will not discuss the question of good faith with the banks or their advocates; it is not involved in this proposed legislation, and can not be introduced in the debate except upon the utterly inadmissible theory that the Government and people of the United States are bound by some sort of compact to furnish these institutions as long as they exist with bonds bearing the same rate of interest as those now outstanding. They now hold and have on deposit \$206,486,050 in bonds bearing interest at the rate of 5 and 6 per cent, and by the express terms of the laws under which they were created the Government has a right to redeem and cancel every one of them at the end of the current fiscal year. It has an undoubted right to redeem and destroy them without issuing any bonds whatever to take their places, and it would not be an act of bad faith to do so. But it has not the means to do this, and therefore it proposes to issue and sell bonds bearing interest at the rate of 3 per cent per annum, and with the proceeds of these sales it proposes to pay the \$206,486,050 held by the banks as well as the \$465,000,000 held by other

people. If this can be accomplished—and many of the best business-men and ablest financiers in the country believe it can be—there will be an annual saving to the people of more than \$14,000,000 in interest on the public debt, to say nothing of the reduction which would almost certainly take place in the commercial rate of interest all over the country. If anybody has a right to complain of the funding of the public debt at 3 per cent—which I deny—it is certainly not the banks who want to issue circulation upon the bonds, but the widows and orphans and other beneficiaries of trust estates whose entire income consists of the interest received upon the securities in which the principal is required to be invested.

“When a private individual, not engaged in the business of banking, purchases, either for himself or as guardian, executor, or trustee, 3 per cent United States bonds to the amount of \$100,000, the whole annual income derived from them is \$3,000; but if a national bank purchases the same amount and description of bonds, and deposits them with the Treasurer as a basis for its circulation, it receives the same amount, \$3,000, annually as interest on the bonds, and besides the Government immediately returns to it \$90,000 of guaranteed notes, of which \$85,500 can be loaned out to the people for its own exclusive benefit at such rates of interest as it will command in the market. It is thus enabled to receive out of the public Treasury \$3,000 annually as interest on its bonds, and if the commercial rate of interest be 6 per cent it receives an additional \$5,130 as interest on the \$85,500 loaned out. From this last amount, however, there should be deducted the sum of \$900, being the 1 per cent tax on circulation, and \$81, the estimated average annual amount of redemption expenses, so that the bank in fact receives the net sum of \$7,149 annually, as against \$3,000 received by the private individual on precisely the same investment.

“But, Mr. Speaker, let us inquire briefly whether any injustice will be done to the national banks, or any hardship will be imposed upon them, by the provision in the fifth section that after July next none but the 3 per cent bonds shall be receivable as security for circulating notes and public deposits. And especially let us inquire whether on that account their profits on circulation will be so diminished as to compel them, or even justify them, in withdrawing their notes and contracting the currency. If the funding contemplated by this bill shall be successfully accomplished, there will be hereafter no Government securities outstanding except the four and a half per cents, the four per cents, and the three per cents which we now propose to authorize; and the banks, if they issue circulation at all, must do so upon one or the other of these classes of bonds. It is susceptible of mathematical demonstration that they can issue circulation more profitably upon a 3 per cent bond at par

than they can upon either a 4½ per cent or a 4 per cent, even at the prices for which they are at present selling in the money market; and it is conceded by every one, whose opinion is at all worthy of consideration, that if a 3 per cent shall be issued and sold at par the prices of the other two classes will advance to such a figure as will make them yield to the investor about the same rate of interest on his actual outlay.

“During the last eleven years, from March 1, 1870, to September 1, 1880, including the whole period of financial distress in this country, the average annual earnings of all the national banks in the United States, numbering 1,481 at the beginning of that period and 2,072 at its close, amounted to 8·4 per cent upon their entire capital and surplus. At the date last mentioned their capital was \$454,215,062, and their accumulated cash surplus was \$120,145,649. This surplus represents net accumulated gains over and above all taxes, expenses, and dividends. During the same period of eleven years they have declared dividends to the amount of \$479,448,181; that is, their dividends alone have exceeded the whole amount of their capital at the end of the period, and in addition they have set apart since their organization and now hold, as just stated, \$120,145,649 as a surplus fund to be divided among their stockholders whenever they see proper to close up their business.

“When we remember that these remarkable results have been accomplished, notwithstanding the general paralysis of business which prevailed during five years of this period, we can appreciate in some measure at least the immense value of the franchise which the Government has conferred upon these institutions, and in return for which it now asks them not to make any substantial sacrifice, but simply to assist it in the negotiation of a loan at 3 per cent in order that the people who have patiently borne such heavy burdens in the past may be relieved hereafter from an annual interest charge of over \$14,000,000. Sir, they can not afford to reject this reasonable demand, and he will be a most unwise and dangerous friend of the national banking system who by his vote or otherwise places the beneficiaries of that system in an attitude of defiance to the will of Congress and the people on this subject.”

The Speaker: “The question recurs on ordering the main question on concurring in the Senate amendment with the amendment of the gentleman from Michigan.”

The main question was ordered.

The question was taken; and it was decided in the negative—yeas 117, nays 132, not voting 41.

So the Senate amendment was not concurred in with the amendment of Mr. Conger.

The amendments of the Senate were then concurred in, and the Speaker declared that the bill had passed both Houses of Congress.

On March 3d the following veto message was received.

The Speaker: "The Chair lays before the House the following message from the President of the United States."

The Clerk read as follows:

To the House of Representatives:

Having considered the bill entitled "An act to facilitate the refunding of the national debt," I am constrained to return it to the House of Representatives, in which it originated, with the following statement of my objections to its passage.

The imperative necessity for prompt action, and the pressure of public duties in this closing week of my term of office, compel me to refrain from any attempt to make a full and satisfactory presentation of the objections to the bill.

The importance of the passage at the present session of Congress of a suitable measure for the refunding of the national debt, which is about to mature, is generally recognized. It has been urged upon the attention of Congress by the Secretary of the Treasury and in my last annual message. If successfully accomplished, it will secure a large decrease in the annual interest payment of the nation; and I earnestly recommend, if the bill before me shall fail, that another measure for this purpose be adopted before the present Congress adjourns.

While in my opinion it would be wise to authorize the Secretary of the Treasury, in his discretion, to offer to the public bonds bearing 3½ per cent interest in aid of refunding, I should not deem it my duty to interpose my constitutional objection to the passage of the present bill if it did not contain, in its fifth section, provisions which, in my judgment, seriously impair the value, and tend to the destruction of the present national-banking system of the country. This system has now been in operation almost twenty years. No safer or more beneficial banking system was ever established. Its advantages as a business are free to all who have the necessary capital. It furnishes a currency to the public, which for convenience and the security of the bill-holder has probably never been equaled by that of any other banking system. Its notes are secured by the deposit with the Government of the interest-bearing bonds of the United States.

The section of the bill before me which relates to the national-banking system, and to which objection is made, is not an essential part of a refunding measure. It is as follows:

SECTION 5. From and after the 1st day of July, 1881, the 3 per cent bonds authorized by the first section of this act shall be the only bonds receivable as security for national-bank circulation, or as security for the safe-keeping and prompt payment of the public money deposited with such banks; but when any such bonds deposited for the purposes aforesaid shall be designated for purchase or redemption by the Secretary of the Treasury, the banking association depositing the same shall have the right to substitute other issues of the bonds of the United States in lieu thereof: *Provided*, That no bond upon which interest has ceased shall be accepted or shall be continued on deposit as security for circulation or for the safe-keeping of the public money; and in case bonds so deposited shall not be withdrawn, as provided by law, within thirty days after interest has ceased thereon, the banking association depositing the same shall be subject to the liabilities and proceedings on the part of the Comptroller provided for in section 5234 of the Revised Statutes of the United States: *And provided further*, That section 4 of the act of June 20, 1874, entitled "An act fixing the amount of United States notes, providing for a redistribution of the national-bank currency, and for other purposes," be and the same is hereby repealed: and sections 5159 and 5160 of the Revised Statutes of the United States be and the same are hereby re-enacted.

Under this section it is obvious that no additional banks will hereafter be organized, except possibly in a few cities or localities where the prevailing rates of interest in ordinary business are extremely low. No new banks can be organized, and no increase of the capital of existing banks can be obtained, except by the purchase and deposit of 3 per cent bonds. No

other bonds of the United States can be used for the purpose. The one thousand millions of other bonds recently issued by the United States, and bearing a higher rate of interest than 3 per cent, and therefore a better security for the bill-holder, can not, after the 1st of July next, be received as security for bank circulation. This is a radical change in the banking law. It takes from the banks the right they have heretofore had under the law to purchase and deposit, as security for their circulation, any of the bonds issued by the United States, and deprives the bill-holder of the best security which the banks are able to give, by requiring them to deposit bonds having the least value of any bonds issued by the Government.

The average rate of taxation of capital employed in banking is more than double the rate of taxation upon capital employed in other legitimate business. Under these circumstances, to amend the banking law so as to deprive the banks of the privilege of securing their notes by the most valuable bonds issued by the Government will, it is believed, in a large part of the country, be a practical prohibition of the organization of new banks, and prevent the existing banks from enlarging their capital. The national banking system, if continued at all, will be a monopoly in the hands of those already engaged in it, who may purchase Government bonds bearing a more favorable rate of interest than the 3 per cent bonds prior to next July.

To prevent the further organization of banks is to put in jeopardy the whole system by taking from it that feature which makes it as it now is, a banking system free upon the same terms to all who wish to engage in it. Even the existing banks will be in danger of being driven from business by the additional disadvantages to which they will be subjected by this bill. In short, I can not but regard the fifth section of the bill as a step in the direction of the destruction of the national-banking system.

Our country, after a long period of business depression, has just entered upon a career of unexampled prosperity.

The withdrawal of the currency from circulation of the national banks and the enforced winding up of the banks in consequence, would inevitably bring serious embarrassment and disaster to the business of the country. Banks of issue are essential instruments of modern commerce. If the present efficient and admirable system of banking is broken down, it will inevitably be followed by a recurrence to other and inferior methods of banking. Any measure looking to such a result will be a disturbing element in our financial system. It will destroy confidence, and surely check the growing prosperity of the country.

Believing that a measure for refunding the national debt is not necessarily connected with the national-banking law, and that any refunding act would defeat its own object if it imperiled the national-banking system or seriously impaired its usefulness; and convinced that section 5 of the bill before me would, if it should become a law, work great harm, I herewith return the bill to the House of Representatives for that further consideration which is provided for in the Constitution. RUTHERFORD B. HAYES.

EXECUTIVE MANSION, March 3, 1881.

Mr. Tucker, of Virginia: "I move that the message of the President be printed, and that it do lie upon the table, subject to be called up at a future time for consideration."

The Speaker: "The question is on the motion to postpone the present consideration."

The question was taken; and there were—yeas 138, nays 116, not voting 36. No further action was taken on the bill.

In the House, on January 5th, the bill to establish a board of commissioners of interstate commerce was taken up.

Mr. Reagan, of Texas: "At the threshold has been raised a question of the extent of our authority. When we come to look at this subject we are confronted by the fact that most of the railroad corporations are the creatures of the State governments. So far as the power of Congress over this subject goes it is derived from the clause of the Constitution which confers upon Congress the power to regulate commerce among the States. It has to that extent the power to regulate commerce. That power carries with it no other powers over these corporations. The Congress have no power, and this committee and this bill assume no power, to operate on the railroads as railroads, or upon their franchises or corporate rights. And when the committee have been asked to remedy other evils, such as the watering of stock as a pretext of levying additional tribute upon the people, we have had to meet the friends of such propositions as that with the statement that we have no power, however much we sympathize with them, to take hold of these corporations and deal with them as such, but our powers are limited alone to the regulation of commerce among the States. While under an unbroken line of precedents the Supreme Court have held that the power is exclusively in Congress to regulate interstate commerce, they hold that the power of Congress is not only exclusive, but that it is ample and as complete in every respect as the power of the State to regulate commerce within the State.

"Perhaps I may as well say that Mr. Story, in his 'Commentaries,' and the justices of the Supreme Court, in their opinions, a number of them, refer to the fact that the point has been made that railroads were not in existence when the Constitution was made, from which it has been inferred that its provisions did not cover the regulation of commerce on railroads. The papers connected with the formation of the Federal Constitution and the transition from the Articles of Confederation to the constitutional government, show that the question which was most conspicuous in those discussions was one which looked to limiting the power of a State to legislate in a hostile manner against the commerce of its sister States, and to conferring upon Congress a power which would prevent them from doing so.

"It is held by the Supreme Court in some of its decisions that it was an evidence of the wisdom, the foresight, and the prescience of that convention that in its few simple, elemental rules of government it was wiser than it could itself foresee, by making a regulation which applied to all the future modes of carrying on commerce among the States, as well as to those which existed at the time. That is as much as I desire to say on that point.

"We take the position that we have no power to regulate commerce over railroads outside of that power which follows the authority to regulate commerce among the States. With that settled under the provisions of the

Constitution as interpreted by the Supreme Court, our pathway is clear on the question of power.

"I desire, now, to call the attention of the House to the provisions of the substitute offered by myself for the original bill. And I desire the attention of the House for a few moments while I endeavor to show that by labor and study the Committee on Commerce of the Forty-fifth Congress succeeded in developing a few simple, plain, clear, and easily understood rules that will obviate the greater number of complaints against the action of the railroads, without in any way embarrassing the railroads or crippling their usefulness.

"And I desire to say here, that in three Congresses, and on three committees, I have heard no member of the committee of the House express any opinion which indicated an hostility to railroads. We all realize their beneficent effect in building up our commerce, in promoting the prosperity of the country, and generally in contributing to the progress of the civilization and wealth of our country. No purpose has existed to cripple them; no one has expressed any desire to inflict a serious injury upon those great interests.

"How do we meet this great question? We propose, first, that one man should not be charged more than another man for like services by a railroad. That is a simple rule, so elemental in its truth that no one can or will controvert its justice or propriety.

"What next? As a corollary to that we propose to say that no rebates or drawbacks shall in any case be allowed. Rebates and drawbacks are simply a means of discrimination which we propose to cut off.

"Next, we propose that the people shall not be deprived of the benefit of competition among these corporations by their pooling freights between competing lines. We propose to secure to the people the benefits of full competition.

"We propose, next, to protect the people of localities by a partial restriction upon the powers of corporations, not by taking away their power of discrimination, but by limiting their power of discrimination between places. And the best rule which we were able to adopt, which does not quite approach equity, but leaves a larger discretion than strict equity would justify, being the best rule we could adopt, is one by which we declare that more shall not be charged for a shorter than for a longer distance on the same haul. For instance, we declare that no more shall be charged for a car-load of freight for one hundred miles than for three hundred or five hundred miles on the same line.

"Remember, we do not use the term *prorate*, we do not use the idea *prorate*. We simply make the car-load the unit. We then provide that more shall not be charged for a car-load for a shorter than for a longer distance.

"Now to illustrate the necessity of this. The sworn testimony before the Committee on Commerce of the Forty-fourth Congress shows that freight from the city of Pittsburg, to be sent to Philadelphia, in the same State, could be placed on the Ohio River and sent down the Ohio River five hundred and forty miles to the city of Cincinnati, where there are competing lines of railroad, and from there sent back through Pittsburg to Philadelphia cheaper than it could be sent directly from Pittsburg to Philadelphia.

"A year ago last winter the commercial bodies of New York and Philadelphia stated before our committee that they could ship articles of commerce from Philadelphia and New York to the city of Boston, and from there ship them to the West cheaper than they could send them directly from those cities to the West. My friend from Nevada here [Mr. Daggett] has the evidence, which, if he has the opportunity, he will present to the House, showing that a car-load of freight sent from Omaha to the West will be charged more if it stops at the Palisades, in Nevada, than if it went to San Francisco and was brought back. Freights could be taken from Omaha to San Francisco on through rates, and back to the Palisades on way rates, as cheap or cheaper than they could be taken from Omaha directly to the Palisades.

"I could go on and multiply instances of this kind to an indefinite extent, showing the necessity of limiting the power of these corporations to discriminate in favor of one locality or business, and against another locality or business, to enrich one town or city, and impoverish another town or city.

"When these corporations were created it was for the purpose of furnishing conveniences of transportation to all the people, and not as instruments of oppression to any.

"These are all the provisions of the proposed bill except one. We require these railroads to print and post up their schedule rates of freight. They say they do that now. If they do, then they pay no respect to their schedules. It was denied by the President of the New York Central Railroad, and by the President of the Erie Railroad, in writing over their own signatures, in answer to an inquiry of the Chamber of Commerce of the city of New York, that they discriminated in rates or made any special rates, and immediately succeeding that denial proof was made before the committee of the New York Legislature engaged in the investigation of the subject that six thousand special contracts had been made by the New York Central Railroad in one year preceding that time—that many instances of special rates, of discriminations.

"I am speaking now of the railroads themselves, not the stockholders, for these fare but little better than the other people of this country. It is the managers, the officers, who profit by the wrongs inflicted upon the people and

the stockholders. One of the modes of doing this is by the organization of corporations within corporations, rings within rings, to control particular branches of commerce in their own interest, and then to exercise the power of discrimination as between men and places, to secure a monopoly in the particular trade. But I pass from that branch to the subject.

"These are the provisions of the bill—simple, easily understood, incontrovertible, on account of the practical truth which underlies and supports each of them. We propose to remedy these evils. We propose three remedies: first, a civil action in behalf of the party aggrieved by a violation of the provisions of this bill, with triple damages in case of recovery; second, a *qui tam* action—a civil suit to be brought and conducted by a public officer where the litigants are unable to combat the power of these vast corporations; and on the successful prosecution of such suit the penalty is to be not less than \$1,000. In addition to this we propose by the bill which I advocate to allow a criminal remedy by indictment against the officers and agents of the corporations violating the law, with a penalty of \$1,000. These measures do not involve imprisonment; they involve pecuniary liability only; but they have been intentionally made sufficiently vigorous to prevent a willful violation of the law.

"But if these simple provisions of the bill, with these remedies so easily understood, were adopted, and nothing more, the measure would not meet the expectations of the public. I looked to the action of the various States to see why it was that State legislation of a somewhat similar character had been ineffectual. I found that suits often failed for want of evidence. When one of the officers of these corporations was summoned before the tribunals of justice and put upon the stand as a witness, he declined to testify. When asked for his reasons, he would say he could not testify without criminating himself; and so he was permitted to stand aside. To overcome this difficulty, to open the mouths of these gentlemen who know what they are doing, we propose to compel them to testify in civil suits in which they are parties, with the reservation that their testimony shall not be used against them in criminal proceedings. This is not an unusual, but in such cases a necessary remedy.

"Again, in States where equitable powers were not given, in the trial of civil cases of this kind it often became necessary to get facts from the books, papers, and documents of these corporations, and when they declined to surrender them the court was powerless to enforce their production. To overcome this difficulty we provide that the courts trying civil cases under this bill shall have equitable as well as legal powers, and may compel the production of books and papers, may compel discovery as in any other proceeding in equity. Thus we provide for opening the mouths, for opening the books, papers, and documents of these cor-

porations, so as to prevent the concealment of facts necessary to the ends of justice, and to prevent evasions of law which would defeat the purposes of the bill.

"These, briefly stated, are the provisions of the bill which I propose to ask the House to adopt as a substitute for the original bill, that substitute being now in fact the bill of the majority."

Mr. Singleton, of Illinois: "I would like to get the gentleman's opinion upon the question of the power of the States to furnish the same remedies proposed by this bill."

Mr. Reagan: "As to the power of the State, it is as full and ample as the power of the General Government, though limited to commerce wholly within the State. The State can adopt the same provisions with reference to State commerce that we adopt with reference to interstate commerce."

Mr. Singleton: "Does not this bill apply to internal commerce?"

Mr. Reagan: "We can not control that; we have not the power to control commerce wholly within a State."

Mr. Singleton: "All the commerce within a State must be internal commerce, of course."

Mr. Reagan: "I will tell my friend how we meet that difficulty. Of course when goods are shipped in a State the commerce originates in the State; but the marks upon the goods indicate whether they are destined to stop within that State or go to another. These marks are put upon the goods, not by the railroad company but by the shipper; and if the shipper in Illinois marks his freight for New York or any other State than Illinois, it is interstate commerce; and the law takes hold of it and protects it from the initial point to the time the freight is landed at its destination."

Mr. Singleton: "What I wished to ask was, whether that commerce would be subject to inspection at the terminal point? Whether the commodity the gentleman treats as commerce *in transitu* would be subject to inspection or not? Is that your understanding?"

Mr. Reagan: "I am not sure that I understand the gentleman's question. There is nothing in the bill in reference to that, however."

Mr. Singleton: "This is a very important inquiry, because our courts have held that it is not even an article of commerce until after it has been inspected, much less commerce itself."

Mr. Reagan: "Very well. However that may be, when a man ships five tons of wheat from Chicago to New York I submit that it is commerce, and it does not take an inspector to make it wheat."

Mr. Rice, of Massachusetts: "I wish to ask the gentleman from Texas whether he believes that Congress has power to oblige the New York Central Railroad in any way to modify its charges on freight received by it at Buffalo, either from railroads coming into Buffalo or by water-carriage over the lakes, that freight to be carried within the State of New York by

the New York Central Railroad, a corporation of the State of New York, and not existing outside of the State of New York."

Mr. Reagan: "I will answer the gentleman from Massachusetts as I have already answered the gentleman from Illinois. Whether the commerce is interstate or State commerce depends upon the fact as to whether it is shipped from one State and destined to another or to a foreign country, or shipped from a foreign country for one of the States. If the commerce is shipped, the bill specially provides that from the point of shipment in the State where it starts to the point of its destination it is interstate commerce in the sense of the law, whether it goes over one or many railroads. It would be undoubtedly as much interstate commerce passing part of the way over water as if it passed all the way over land. The question of water or land transportation has nothing whatever to do with the character of the commerce, but simply its origin and destination. Its origin and destination fix the fact."

Mr. Singleton: "I would like to ask the gentleman from Texas myself, further, if a stream should have its source in one State, and thread its way through the mountains and valleys for one half its length before it became navigable and subject to the power of Congress, would it be an interstate stream?"

Mr. Reagan: "That is a question that has already been decided by the courts of the country. The Supreme Court has settled that question, and it is even stronger than the question of my friend from Illinois. They have declared, and the decision has been repeated, that if a commerce originates upon a stream running entirely within a State which ends by emptying into another stream or bay, gulf or sea, and thereby communicates by water with other States or foreign countries, the commerce which passes on from State to State is interstate commerce. The Saginaw River in Michigan, a small stream only forty miles long, is given as an example. All its course is wholly within the State of Michigan, but the commerce passing on it to other States is held to be interstate commerce."

Mr. Harris, of Virginia: "The gentleman says the destination of the commerce shall determine its character. Then let me suppose a case that must inevitably arise. Goods or produce in Ohio destined for Wheeling, West Virginia, are shipped on a road that has no control east of the west bank of the Ohio River, and the company says, 'We will ship this to the west bank of the Ohio River, but we have no power to ship it beyond that'; would that be, under the gentleman's bill, interstate commerce if landed on the Ohio River, simply because directed to Wheeling, on the east bank of the Ohio River?"

Mr. Reagan: "I will read a clause of the bill which answers the gentleman's question. We knew the railroads would make the exact point which my friend from Virginia has made, and

we undertook to settle that for them. The bill provides:

"No break, stoppage, or interruption, or any contract, agreement, or understanding, shall be made to prevent the carriage of any property from being and being treated as one continuous carriage, in the meaning of this act, from the place of shipment to the place of destination, unless such stoppage, interruption, contract, arrangement, or understanding was made in good faith for some practical and necessary purpose, without any intent to avoid or interrupt such continuous carriage, or to evade any of the provisions of this act.

"We take care to provide in advance that the object of the act shall not be defeated by the machinations of the railroads; and if you will give us the bill I will guarantee that that shall not be done."

Mr. Rice: "I desire to ask the gentleman a question right there. Does he contend that, under that section he has read, Congress can force the New York Central Road—I speak of that road merely in illustration—to make any rates beyond its terminus or to do anything else than take the freight that comes to it at Buffalo and carry it to its destination? Can the power of Congress be exerted over that State corporation to compel it to make contracts and rates beyond the State?"

Mr. Reagan: "What I propose to say to the gentleman from Massachusetts is, that this bill nowhere fixes any rates. It expressly avoids making any rates. But it takes the protection of the commerce between the States into its control, and out of the monopoly powers of the corporations; it prevents charging one man more than another man; it prevents rebate and drawbacks; it prevents pooling of freights, and prevents unjust discriminations between place and place. And the gentleman, before he debates this question intelligently, must separate his idea of regulating freights from the consideration of this bill.

"I know, sir, in all preceding discussions here in this House, in our committee, and in the committee of the Senate, the lawyers and managers of railroads have attempted to confuse this subject by saying that members of Congress, by their vocation, were not qualified to regulate railroad traffic. I have answered that before as I answer it to-day. They have said that none can do it but experts. God deliver this country if its interests are placed in the hands of railroad experts, in the interest of railroad companies, under the dictation of railroad officers! Sir, we have done better than that. We ask no aid of a railroad expert. We ask but honest consciences and common-sense to solve these propositions. What expert is necessary to say that the gentleman from Massachusetts shall not pay two dollars a ton for his freight while the gentleman from Illinois pays only one dollar a ton for the same sort of freight over the same ground? What expert is necessary? Common justice, common right, common necessity settles that question, and settles with equal conclusiveness the question against rebates and drawbacks, against

the pooling of freights, and against the destroying of one city or town or business for the benefit of another."

Subsequently, on March 1st, the House refused further to consider the bill.

In the Senate, on February 2d, the following resolution relative to counting the electoral votes for President and Vice-President of the United States was taken up and considered:

Resolved, That the Senate will be ready to receive the House of Representatives in the Senate-Chamber on Wednesday, February 9th, at twelve o'clock meridian, for the purpose of being present at the opening and counting of the votes for President and Vice-President of the United States; that two persons be appointed tellers on the part of the Senate to make a list of the votes for President and Vice-President of the United States as they shall be declared; that the result shall be delivered to the President of the Senate, who shall announce the state of the vote, which shall be entered on the journals, and, if it shall appear that a choice hath been made agreeably to the Constitution, such entry on the journals shall be deemed a sufficient declaration thereof.

The pending question being on the amendment reported by the select committee to take into consideration the state of the law respecting the ascertaining and declaration of the result of the election for President and Vice-President of the United States, to strike out all after the word "resolved" and insert:

1. That the two Houses of Congress shall assemble in the hall of the House of Representatives on Wednesday, the 9th of February, 1881, at twelve o'clock m., and the President of the Senate shall be the presiding officer; that one person be appointed a teller on the part of the Senate and two on the part of the House of Representatives to make a list of the votes as they shall be declared; that the result shall be delivered to the President of the Senate, who shall announce the state of the vote and the persons elected to the two Houses assembled as aforesaid, which shall be deemed a declaration of the persons elected President and Vice-President of the United States; and, together with a list of votes, be entered on the journal of the two Houses.

2. That if it shall appear that any votes of electors for President or Vice-President of the United States have been given on a day other than that fixed for casting such votes by act of Congress, in pursuance of the Constitution of the United States; if the counting or omitting to count such votes shall not essentially change the result of the election, they shall be reported by the President of the Senate in the following manner: Were the votes of electors cast on the — day of —, 1880, to be counted, the result would be for A B for President of the United States — votes, and for C D for President of the United States — votes; if not counted, the result would be for A B for President of the United States — votes, and for C D for President of the United States — votes; but in either event — is elected President of the United States. And in the same manner for Vice-President.

Mr. Morgan, of Alabama: "I desire to insert after the word 'resolved' and before the figure 1 in the amendment the words 'by the Senate, the House of Representatives concurring.' The substance of the resolution is a concurrent resolution."

Mr. Edmunds, of Vermont: "That is necessary."

The Vice-President: "The Chair hears no objection, and that modification will be made."

Mr. Morgan: "I also move to strike out the words 'one person,' where it reads 'that one person be appointed a teller on the part of the Senate,' and to insert 'two persons,' and changing 'a teller' to 'tellers,' so as to make it read 'that two persons be appointed tellers on the part of the Senate'; so that the Houses shall be equally represented."

Mr. Edmunds: "That is right."

The Vice-President: "Is there objection to this amendment? The Chair hears none, and it is agreed to."

Mr. Morgan: "Mr. President, it is just one week from to-day until the Constitution and the law will require that the two Houses of Congress shall assemble at some place for the purpose of counting the vote of electors for President and Vice-President. In May last the Senate sent to the House of Representatives a rule upon this subject, which the House, so far as we are advised, has failed to take action upon. The time is drawing so short for the preparation which is necessary for this very important constitutional event that I suppose, in fact, I know, that Senators on both sides of the Chamber consider that it is time that we should take some measures for the purpose of bringing the two Houses together, so that the votes of the electors may be counted."

"The committee, I will say the majority of the committee, have concurred with the Senator from Kansas [Mr. Ingalls], who offered the resolution for which the committee offers a substitute, in the opinion that it is now necessary for us to go back to some of the old precedents of the fathers in order that we may get together in due form with as little of irritation and as little of debate as possible for the purpose of performing this important duty."

"The Senate is aware of the fact, morally convinced of it, that some difficulty exists in reference to the electoral votes from at least one State; and while this matter has not been revealed to us, can not be revealed to us in any authentic form till the opening of the certificates that have been sent to the Vice-President, still we know so well the existence of the fact that the State of Georgia did not cast her vote on the same day that the other States of the Union cast their votes, that it becomes an important matter that some step should be now taken to prevent controversy, when the two Houses have met together, over that vote. Fortunately for the country, that appears to be the only irregularity, the only difficulty, that is presented in respect of any of the votes of the electors from any of the States."

"I think the country is to be congratulated that, after we have had so many difficulties in the past, we at last have an election where there appears to be but one question which can give rise to controversy or difference of opinion in the counting of the votes of electors."

For my part, so far as I am advised, I am ready to admit, upon all the facts that have been made public, upon that sort of history which is recognized by all men in this country, that Mr. Garfield and Mr. Arthur have been elected President and Vice-President of the United States; that the people of the United States in the respective States have chosen electors who have cast the electoral vote in such a way that they have received each of them a majority of all the votes for the offices for which they have been respectively chosen. I would not put the slightest embarrassment in the way of a peaceful, regular, and orderly count of that vote, and the transmission of our highest office from the hands of the gentleman who now holds it to the hands of his successor; and I believe that in the expression of this sentiment I shall receive the cordial accord on the part of Senators on both sides of this Chamber."

"The question in reference to the State of Georgia is one of such serious importance, considered in reference to itself alone, considered in reference to the nature of the question, as that it might require properly long and careful deliberation for this body and the other House to come to a conclusion as to what was the true constitutional rule to be adopted. There are very grave differences of opinion on this question, because the question itself is one of great gravity and one of great importance. It seems to me impossible at this time, in the brief period which must intervene between this and the counting of the electoral votes, that we should arrive at a constitutional settlement of that question. Indeed, the tribunal which is to make a constitutional determination of that question is itself a matter of serious disputation, and has been for a great number of years. The manner of arriving at a solution of it, whether by an independent expression in each House, or by a concurrent resolution, or by a joint resolution, or by a law, is also a matter of serious disputation, and has been for a great many years."

"It was, therefore, thought better by the majority of the committee—and I dare say that in this also there is perhaps a concurrence even of the minority—that a precedent which had been acted upon in one form or another during three controversies of this kind should be adopted. It being certain, as we understand, that Mr. Garfield is elected President of the United States, without reference to the question whether the vote of Georgia is counted, or not counted, it seems to be the duty of the two Houses now to arrive at, to ascertain, to declare, and to enforce the result in which the country will find its peace, and I hope and trust its satisfaction. We, therefore, have thought that it was not inappropriate, that it was not a transgression of the traditions of this country, that indeed it was the best thing to do under the circumstances, to adopt that rule which was adopted in 1837, and which is substantially adopted in this resolution, with the ex-

ception that the name of a State is not included in the resolution; but the fact that some State may have voted, or perhaps has voted, on a day not that fixed by laws of Congress and the Constitution of the United States, is stated in the resolution, and the resolution is predicated upon the assumption that such a fact exists, and, if it is found to exist, an order is arranged to be taken in that event by which that vote can be disposed of without producing any friction in the two Houses when they are assembled. I beg leave to say that in the case of the vote of Wisconsin, in 1857, when such preparation was not made, though the fact was known and should have been anticipated, the omission of this preparation to make provision for the event led to such things in the joint meeting of the two Houses, and afterward in each House, and to such disputation and such discontent on the part of members of the House of Representatives and the Senate as to the settlement of that question, and as to whether it was settled or not settled, as it would be desirable to avoid. In view of what then occurred, it seems to me it is the part of patriotism and prudence that we shall now take some steps for the purpose of anticipating and avoiding that danger."

Mr. Edmunds: "Mr. President, I have listened with great pleasure to the observations of the Senator from Alabama, who has stated that a constitutional election, as we understand it, of a President and Vice-President of the United States has been achieved, and that the persons elected are the persons whom he has named, so that all that is left is really a ceremonial, because the Constitution says that the votes, being opened, shall be counted, and that the person who has the majority, being a majority of all the electors appointed, shall be the President of the United States. That makes the Constitution the same as if it had said, shall be the President of the United States, whatever anybody may say to the contrary, be that body the President of the Senate, the Senate, the House of Representatives, or any two or all three of those bodies together. I think, myself, that is the Constitution, and that the Constitution never intended to leave it, and never has left it, by force of the Constitution alone, to any one or all of these three authorities to determine who has been elected by the States—and I emphasize that word as a State-rights man—to be the Chief Executive of the nation for the period mentioned in the Constitution.

"I have no disposition to discuss or criticise the second part of the amendment recommended by the committee, in respect of, as it is understood, the State of Georgia, rejecting, as I do, and denouncing—not in the sense of personal hostility, but in its broader sense—all implications that any amount of casuistry might draw out of the way in which this amendment is stated, either in its first or in its second part, as to an assumption of power on

the part of anybody under the existing state of the law to decide in the sense of a finality, or in the sense of any legal effect, whether the vote of the State of Georgia ought to be counted or not.

"So saying—and saying this, I think, for all Senators who agree with me in these general principles, and I believe everybody does—I am willing for one to acquiesce in this method of not disposing of or deciding upon the question, or rather in this method of not disposing or deciding upon any question whatever. In this state of certainty, as we suppose, it is not necessary that we should go into the question of whether you as the President of the Senate, or whether the two Houses together or separately, or all three, can determine any question arising out of an event like this.

"With this disclaimer and denunciation of the implications which, as I said before, casuistry might possibly raise out of the language of this amendment, I am willing to have the ceremony proceed; but I submit to the chairman of the committee and to the Senate that the words 'hall of the House of Representatives' ought to be stricken out, and the words 'Senate-chamber' inserted in their place, and I make that motion.

"I make it not because I suppose or suspect that there is the slightest practical consequence on this occasion in such a change; but precedent does make history and does make law in a certain sense, and the time may come (as it has on one occasion already come) when the carrying of these archives, the voice of thirty-eight sovereign States, an eighth of a mile through such a great crowd of people whom you do not know, in a time of high excitement, to the other end of this Capitol building, would be a matter of danger and exposure; and when you look to the theory of the Constitution—I am not talking about the mere legal propriety of going over to the House of Representatives; I do not for the present deny it or assert it; but I am talking about the wise thing and the wise spirit of the Constitution that says these votes shall be sent to the President of the Senate. They are sent to him as an officer. The person of the President of the Senate may change from day to day, as we all know, including the President *pro tempore* who is the President of the Senate for the time being. They are sent, therefore, to this body, in the person of its presiding officer. I do not mean by that to say that the body has any control over them; but I use that phrase in order to show that they come to the head of this body in his official character.

"The Constitution itself says that on the day appointed by law, he, having in charge the sacred records, shall open them in the presence of the two Houses, that then the votes shall be counted, and so on. I submit, therefore, earnestly to my honored friend, the chairman of this committee, and to all other Senators, that the true and only wise place—I am not now

talking about the mere technical law—for performing this great function is the place where the President of the Senate officially and rightfully always is.

“The only argument that was ever suggested against that has been simply the argument of physical convenience; that, as the chambers of the Capitol used to be (after the earlier days when it was done here), the hall of the House of Representatives being larger, it was physically more convenient to have it done there, and so it was for a great many years. But the hall of the Senate is now large enough to leave no physical obstacle to the convenient dispatch of that business here; and, therefore, I claim and I urge upon Senators the propriety of causing this great act to be done in the place where on every theory and upon every principle of security and wise procedure it ought to be done. If at some future day there should arise a disturbance and a trouble, and the President of the Senate and the tellers appointed by the Senate, if there should be any, on such an occasion, moving this eighth of a mile into the other House, should be despoiled of these documents, it would be a very serious thing. If on some such occasion also it should happen that a disagreement, a disturbance, a tumult should arise in the hall of the House of Representatives, as there has been—not a very serious one, but as there has been on the occasions of the counting of votes in a case like this, where there was no doubt in any man’s mind as to what the result was, producing a scene of tumult and confusion where nothing could be done except for the President of the Senate to say without taking the opinion of the Senate about it at all that the Senate would now withdraw and march out—that would be very inconvenient.

“If any such scene should occur hereafter, as I pray there never will, if anybody is to withdraw—I am not now trying to impress anybody with my ideas about the power—let the withdrawal take place so as to leave the President of the Senate and these public documents in the place where they belong; do not require the person whom the Constitution says, as such person, shall open these votes, to move an eighth of a mile, or any other distance from his proper place, in order that whatever may constitutionally be done on that occasion, or succeeding it, may go on.

“I appeal to Senators, therefore, to vote for this amendment which I offer, to make this place, now when there is no question, the place for the opening and the counting of these votes. As I said before, the only argument that was ever made for another place, that of mere physical convenience, has no weight, inasmuch as this chamber is large enough for every member of the Senate, and every member of the other House, to be comfortably accommodated.”

Mr. Thurman, of Ohio: “Mr. President, for

seventy-odd years, if my memory is not at fault, the votes of the electors of President and Vice-President have been counted in the hall of the House of Representatives; and on no occasion has any Senator, either going to or returning from that hall, been in any way molested or insulted. I am not for changing a practice sanctioned by such long usage, and especially am I not in favor of introducing a subject about which the two Houses may disagree, when on this day week, only seven days from this time, it will be our duty to attend the counting of these votes. I hope the motion of the Senator from Vermont will be voted down.”

Mr. Hill, of Georgia: “I rise now simply to say one or two things in relation to the vote of my own State. I have seen it intimated, and more than intimated, in several quarters, that the failure on the part of the electors of Georgia to cast their vote on the day fixed by the law of Congress arose from a disposition in that State to regard the law of the State on this subject as of higher authority than the law of Congress. I wish to say here that that is not true. There was no intention or idea on the part of anybody in Georgia, in authority or out of authority, to disregard the law of Congress on this subject, or doubt that the law of Congress fixing the day for the vote by the electors was the supreme law. There has never been any law in Georgia in conflict with the law of Congress, or intended to be in conflict with the law of Congress, on that subject.

“Without going into the particular history to explain how it happened (a fact which we all know but do not yet know officially) that the electors of Georgia did vote one week after the day fixed by the law of Congress, I simply say that there was simply a failure to know the fact that the first Wednesday in December, 1880, came before the first Monday in December. The failure to know that simple fact of the almanac caused the whole trouble, and there was no desire or intent on the part of anybody to hold that the State law was supreme over the Federal law on this subject, no desire to disregard the Federal law. Indeed, the whole intent was to comply with the law of Congress and vote on the day that the electors in all the other States voted. It was just one of those accidents that may happen anywhere or at any time.”

The Presiding Officer [Mr. Anthony in the chair]: “The question is on the amendment of the Senator from Vermont” [Mr. Edmunds].

The result was announced—yeas 22, nays 36.

So the amendment to the amendment was rejected.

Mr. Eaton, of Connecticut: “I do not intend to discuss the question at any length, but I have a word to say. I can not support a resolution upon this subject which leaves one very important question in doubt, and that is the question whether the President of the Senate has the right to count the votes for Presi-

dent and Vice-President of the United States. There was a resolution of this sort which I supposed would be brought up yesterday :

"[June 15, 1880.—Ordered to be printed.]

"Mr. Morgan submitted the following resolution :
"Resolved by the Senate (the House of Representatives concurring), That the President of the Senate is not invested by the Constitution of the United States with the right to count the votes of electors for President and Vice-President of the United States so as to determine what votes shall be received and counted or what votes shall be rejected.

"I had supposed that the resolution would have been called from the table yesterday and acted upon, and, if that resolution had been called up and acted upon affirmatively, I should cheerfully give my vote for the other resolution of the committee, because I should have considered the action of the Senate upon that resolution a determination of their meaning of the resolution which is now before the Senate. But that has not been called up, it has not been acted on. The pending resolution reads in this way :

"*Resolved by the Senate (the House of Representatives concurring), That the two Houses of Congress shall assemble in the hall of the House of Representatives on Wednesday, the 9th of February, 1881, at 12 o'clock, M., and the President of the Senate shall be the presiding officer; that two persons be appointed tellers on the part of the Senate and two on the part of the House of Representatives, to make a list of the votes as they shall be declared.*

"What does that mean? The honorable Senator from Alabama says that the word 'declared' there is simply the declaration of a clerical fact; another Senator says that the word 'declared' there means that A B, C D, and E F are elected or appointed as electors for President and Vice-President. I can not vote for a resolution that leaves any doubt upon the subject, and, therefore, at the proper time—and if this be the proper time in the opinion of the Chair—I shall offer an amendment now, in the words of the Constitution of the United States. I move to strike out the words 'as they shall be declared,' and to insert in lieu thereof 'as the certificates shall be opened by the President of the Senate.' Those are the words of the Constitution, about which there can be no mistake, about which there can be no two opinions. That is the duty of the President of the Senate; and when he has executed that duty then the officers who have been appointed by the Senate and the House will count the votes and hand up their list to the President of the Senate, and he will make the necessary declaration.

"I can not vote for any resolution that leaves any doubt upon that great and important point. It is of no importance, I agree, so far as this election is concerned. Everybody concedes the election of General Garfield and General Arthur. Everybody concedes that they will on Wednesday, the 9th day of February, in some way be declared to be the choice of the people. I regret it, but it is so. But I can not vote that the President of the Sen-

ate shall declare that fact, for it is not his duty."

The Presiding Officer: "The amendment will be reported."

The Chief Clerk: "In the amendment of the committee, it is proposed to strike out the words 'as they shall be declared' and to insert 'as the certificates shall be opened by the President of the Senate'; so as to read :

"That two persons be appointed tellers on the part of the Senate, and two on the part of the House of Representatives, to make a list of the votes as the certificates shall be opened by the President of the Senate."

Mr. Thurman: "It has been truly said by Senators on this floor, and we know it is so, that we are tiding over the present case; that is, we do not decide it. We do not decide really who, under the Constitution, has the judicial power. Are we to blame for that? Our forefathers, eighty years ago, tried to decide it, and they could not. John Marshall drew a bill, when he was a member of the House of Representatives, and it passed that House, I think, but the Senate did not agree to it. The greatest minds in this country have tried it, and it is no disgrace to us that we have not been able to agree upon a measure when John Marshall and his associates in his day were unable to pass a bill. Mr. Van Buren tried it, when he was a member of the Senate, and failed. I hoped that it might happen in my time, not that I might do much about it, but that I might have the satisfaction of voting for it, and that we might agree upon some proper law on the subject. I hope yet it may happen that such a law may be perfected by those who are to come after me, and that, too, before another presidential election shall occur. But 'sufficient unto the day is the evil thereof.' Your committee have reported a resolution that every man in this body and every man in the House can fairly vote for, as our forefathers voted for similar resolutions for more than half a century, and under which we have got along quietly in the count of the presidential votes.

"Although I agree with my friend from Connecticut that, if I were framing this resolution for the first time, I would leave these words out, I hope the amendment will not be adopted, but that the resolution as reported by the committee will be agreed to, and that without any further modification."

Mr. Blaine, of Maine: "Mr. President, I do not intend to detain the Senate by any discussion of the amendment of the Senator from Connecticut, but I wish to submit an observation on what the Senator from Ohio has said about the impossibility of getting a law on this subject. He says that seventy or eighty years ago John Marshall tried to correct a trouble then existing and failed; that there is in some way an inherited disability upon the Congress and people of the United States to escape in any way from the danger which we now quadrennially encounter."

Mr. Thurman: "I said nothing of the kind."

Mr. Blaine: "I understood the Senator to say that as John Marshall had failed in doing it, and Martin Van Buren had failed in doing it, it seemed to be something we ought not to take any reproach to ourselves for not doing."

Mr. Thurman: "If the Senator will allow me to interrupt him, I said that what they failed to accomplish, it was no disgrace to us that we can not. I did not say, however, that it would not be accomplished."

Mr. Blaine: "I do not know of any disgrace that was said to attach to it."

Mr. Thurman: "If the Senator from Maine should remain in the Senate—and I am sorry he is going out of it—I have no doubt he would accomplish it before another presidential election."

Mr. Blaine: "I believe he would if he could get the votes of the Senators to go with him. I believe that any good, square, sensible man, and I do not profess to be anything else, could correct this if you could get the two parties to forego partisan advantage. But the trouble is, that the moment the Democratic party got into possession of both branches of Congress at the middle period of the last four years, they did not want to touch the question. I do not, in this debate, attribute to the Democratic party anything more than I would attribute to any other party; but it somehow has fallen out in the history and development of this country that whereas the founders of the Constitution intended that Congress should have nothing whatever to do with controlling the election of President and Vice-President, they now have everything to do with it, and it has now fallen out that when a party, whether it be the Republican or the Democratic party, controls both branches of Congress, and decide on a question of doubtful electoral votes, they are apt to decide for their own candidate."

Mr. McDonald, of Indiana: "On their own side?"

Mr. Blaine: "Yes, whether it is a Democratic or a Republican Congress. In my judgment, if the elections of 1878 had given a Republican House of Representatives, and we had had a Democratic Senate, we would have secured a law on this subject. If that is any reproach to either party, it is equally divided, and I am perfectly impartial in the distribution of blame."

"If we are to believe the earnest speeches made here in 1876, we were then right on the crater of the volcano, right where the yawning gulf of chaos and dissolution confronted us, and we escaped it by a make-shift, and a pretty rickety one it was. The Senator from Connecticut [Mr. Eaton] bows assent to that statement. He and I walked out of this chamber together on that pleasant winter morning when the bill for the Electoral Commission passed, having both voted against it. Whether it was an evil or a good it is not worth while now to discuss. If an evil, we are in the negative on

that vote, on the right side of the record. No matter, it was a make-shift; it was purely and entirely a make-shift. It settled nothing, and unsettled everything, and in the most important crisis that can confront any people, or any government—the law of succession—the people of the United States are to-day without law. There is no rule by which this system is settled. The chairman of the Judiciary Committee tells us it looks to him like an impossibility that we can get a law on this subject."

"I do not know what may possibly be the political complexion of Congress for the next four years. We are going to start out with a Republican House, but if anybody can tell me what the Senate will be after the 4th of March he is a wiser man than I am. However, I hope there will be at least that sort of divided power which will not give the assurance to either political party that they will have the undisputed sway in 1884, or in any subsequent year, over the electoral votes, and that the patriotism of both parties will come to see that taxation and tariff and funding bill and public debt are all of a subordinate character compared with this great question, which may involve a civil revolution at any moment. Fortunately, the present election was conclusively settled in the electoral college, but I ask, without intending the slightest offense, what chance would General Garfield have to be inaugurated on the 4th of March if there was a doubtful electoral vote that came up here, which counted one way would elect Hancock, and counted the other way would elect Garfield?"

Mr. Farley, of California: "Has the Senator come to that conclusion from the action of the Republicans in 1876?"

Mr. Blaine: "I have come to that conclusion from things I have seen here, and from the common frailties and common instincts of human nature. I have come to the conclusion that if this were a Republican Congress they would decide for their candidate, and being a Democratic Congress they would decide for their candidate. I am imputing nothing to the Democratic party that I do not also impute to the Republican party. I will not impute anything to either of them not inherent in the weakness of human nature. With that crisis staring us in the face, quadrennially returning here, and with that wonderful inclination or destiny which divides people about half and half on any given issue, the question remains undetermined. You can assemble the people by blowing a horn on the east front of the Capitol and state any issue to them, and ten to one they will divide about equally upon it. Of the thirty-eight States in this Union nineteen voted for Hancock and nineteen for Garfield. The nineteen for Garfield had a few more electoral votes than the nineteen for Hancock."

Mr. Eaton: "And the other nineteen had a few more thousand votes."

Mr. Blaine: "Upon that subject I will not enter. The popular vote, I believe, as shown

on the record, after depriving three or four hundred thousand American citizens of their dear right of suffrage, gave three or four thousand popular majority for Hancock. Another count gives three or four thousand for Garfield; but I am not bringing that into discussion. The popular vote was very nearly equally divided; and to-day, whether there be nine or ten million voters in this country, speaking in rough and equal phrase, they are about one half Democratic and one half Republican, as the States are about the same, and they will in all probability remain about the same. This even division seems to be the natural outgrowth of republican institutions based on free discussion, and seems as clearly predestined almost as that the world should be peopled one half of one sex and one half of the other. It so comes; and we are not escaping this contingency except for four years. No man knows what four years, or one year, may bring forth in the tides of political fortune.

"Therefore, I say it is the first duty of common patriotism that both parties should devote themselves to a constitutional, comprehensive remedy, and not have us present the spectacle every four years of going through some extraordinary contrivance by which we shall prevent anarchy from engulfing the country. I think the severest strain to which this country was ever subjected outside the war of the rebellion was the incidents connected with the settlement of the presidency in 1876, and I doubt whether, if the term had been for a period of ten years, this country could have found an entirely peaceful solution. I say that for the benefit of the gentlemen who think we ought to have a longer presidential term. If that had been for a ten-years' settlement of the presidency, I do not believe we could have had as peaceful an adjustment as we happily reached. We got the advantage of a short term of four years, giving a period in the near future in which the case might be tried over again before the high court of the people. The shorter the term the more content the people are to submit. That is why the States that have had annual elections have had the most peaceful administrations in this country, and why they have had the most peaceful political contests. I believe the honorable Senator from Connecticut and myself will both live to see, with regret, that the New England States are giving up their old system of annual elections, and resorting to the biennial period. I believe the annual election of Governor and Legislature in these States has conducted very largely to the peacefulness and harmony and success of their administrations, as well as to the general readiness and heartiness of submission to the result by the defeated party. If beaten this year, in only twelve months you can try it again, and with one or two notable exceptions there has been very little excitement or disorder consequent upon the result.

"I am very sure, at all events, that there has

been less of unhealthy and dangerous excitement in States that have had annual elections than in any other States in the Union, and I believe that, just in proportion as you elongate and lengthen the term of service of the President of the United States, just in the same proportion will there be extraordinary agitation attendant upon it. If it were a two-years' term, elected as the House of Representatives is, bearing the imprint, as the Executive ought, of the popular branch of Congress, there would be less excitement than there is now. Make the term six, eight, or ten years, and you increase the excitement exactly in the same ratio. Now we have a four-years' term. It is not likely to be changed, certainly not within the life-time of this generation; but four years to men who have reached forty and fifty and sixty years comes around very rapidly; it comes around rapidly to all. It will be here very soon again, and it will be a reproach to that side of the chamber and to this, to the Senator from Ohio and to myself, and to all of us, if there be not something done to relieve the country from the apprehension of what occurred in 1876, and what may occur again if no wise forecast be taken to prevent it."

The Presiding Officer: "The question is on the amendment offered by the Senator from Connecticut [Mr. Eaton] to the amendment of the committee."

The roll-call having been concluded, the result was announced—yeas 27, nays 23.

So the amendment to the amendment was rejected.

The amendment, as amended, was agreed to.

The Presiding Officer: "The question is on the resolution."

The resolution was agreed to.

In the House, on February 5th, the joint resolution was considered and adopted.

COUNTING THE ELECTORAL VOTE.

At twelve o'clock M., February 9th, the Door-keeper announced the Senate of the United States.

The Senate entered the hall, preceded by its Sergeant-at-Arms and headed by the Vice-President and the Secretary of the Senate, the members and officers of the House rising to receive them.

The Vice-President took his seat as presiding officer of the joint convention of the two Houses, the Speaker occupying the chair on the left of the Vice-President.

The Vice-President: "The two Houses have assembled in pursuance of the Constitution that the votes may be counted and declared for President and Vice-President of the United States for the term of four years from the 4th day of March, 1881. It becomes my duty under the Constitution, as the President of the Senate, to open the certificates of election of the several States of the nation, in the presence of the two Houses, and I now proceed to dis-

charge that duty. The tellers appointed on the part of the Senate and the House will please take their seats."

Senators Hamlin and Thurman, the tellers appointed on the part of the Senate, and Mr. House and Mr. Crowley, the tellers appointed on the part of the House, took their seats at the Clerk's desk, at which the Secretary of the Senate and the Clerk of the House also occupied seats.

The Vice-President: "I open the package purporting to contain the certificates of election of the State of Alabama, and hand those certificates to the tellers to be reported."

Senator Hamlin (one of the tellers) read in full the certificate of the vote of the State of Alabama, giving 10 votes for Winfield S. Hancock, of the State of Pennsylvania, for President of the United States, and 10 votes for William H. English, of the State of Indiana, for Vice-President of the United States.

Mr. House (one of the tellers) then read at length the certificate of the vote of the State of Arkansas, and announced the electoral vote of that State for President and Vice-President.

Senator Thurman (one of the tellers) then read the certificate of the vote of the State of California, and announced the electoral vote of that State for President and Vice-President.

Mr. Reagan, of Texas: "Mr. President, I suggest that, by unanimous consent of the joint convention, the reading of the formal parts of the certificates be omitted."

The Vice-President: "That may be done by unanimous consent, and was the course pursued at the counting in 1857. Is there objection to the course suggested by the gentleman from Texas?" [After a pause.] "The Chair hears none, and that course will be pursued."

Mr. Edmunds, of Vermont: "I would suggest, in view of the unanimous consent that has been given, that the tellers might examine the certificates as to their formalities, and the Chair could pass down in advance one of the certificates in order that it might be examined by the tellers, while one of the tellers is announcing the vote of the State preceding."

The Vice-President: "The Chair will adopt the suggestion."

The tellers then proceeded to announce the electoral votes of the States of Colorado, Connecticut, Delaware, and Florida.

The Vice-President: "The Chair now hands to the tellers the certificate of election of the State of Georgia."

Mr. Springer, of Illinois: "I call for the reading of that certificate in full."

The Vice-President: "The certificate will be read at length."

Mr. Crowley (one of the tellers) then proceeded to read in full the certificate of the vote of the State of Georgia, but, before concluding, Mr. Springer said, "Mr. President, I withdraw my demand for the reading in full of the certificate of the State of Georgia."

The Vice-President: "The further reading

will be omitted, and the result of the vote will be announced."

Mr. Crowley (one of the tellers) then announced the result of the vote of the State of Georgia, for President and Vice-President of the United States.

The Vice-President: "It appearing from the certificates just read that the votes of the State of Georgia were cast on a day other than that fixed by act of Congress in pursuance of the Constitution of the United States, the result of those certificates will not be recorded until, in the language of the concurrent resolution under which the count proceeds, 'it shall appear whether the counting or omitting to count such votes will essentially change the result of the election.' When that fact shall appear, the record will be made agreeably to the provisions of the concurrent resolution."

The certificates of the remaining States were then opened, and the votes announced as they appear in the following statement submitted by the tellers:

Number of electoral votes to which each State is entitled.	STATES.	FOR PRESIDENT.		FOR VICE-PRESIDENT.	
		The vote of Georgia, cast on the 8th of December, second Wednesday of the month, if counted.		The vote of Georgia, cast on the 8th of December, second Wednesday of the month, if counted.	
		James A. Garfield, of Ohio.	Winfield S. Hancock, of Pennsylvania.	Chester A. Arthur, of New York.	William H. English, of Indiana.

10	Wisconsin	10	..	10	..
369	Total	214	155	214	155

When the votes of all the States had been severally announced, Senator Thurman (one of the tellers) said: "The tellers report that the whole number of the electors appointed to vote for President of the United States is 369, of which a majority is 185. Were the votes of electors for the State of Georgia, cast on the second Wednesday of December, 1880, being the 8th day of said month, to be counted, the result would be: for James A. Garfield, of the State of Ohio, for President of the United States, 214 votes; and for Winfield S. Hancock, of the State of Pennsylvania, for President of the United States, 155 votes. If not counted, the result would be: for James A. Garfield, for President of the United States, 214 votes; and for Winfield S. Hancock, for President of the United States, 144 votes. In either event James A. Garfield has received a majority of the votes of the whole number of electors appointed."

"And the state of the vote for Vice-President of the United States is as follows: the whole number of the electors appointed to vote for Vice-President of the United States is 369, of which a majority is 185. Were the votes of electors for the State of Georgia, cast on the second Wednesday of December, 1880, being the 8th day of said month, to be counted, the result would be: for Chester A. Arthur, of the State of New York, for Vice-President of the United States, 214 votes; and for William H. English, of the State of Indiana, for Vice-President of the United States, 155 votes. If not counted, the result would be: for Chester A. Arthur, for Vice-President of the United States, 214 votes; and for William H. English, for Vice-President of the United States, 144 votes. In either event Chester A. Arthur has received a majority of the votes of the whole number of electors appointed."

The Vice-President: "Wherefore, I do declare that James A. Garfield, of the State of Ohio, having received a majority of the votes of the whole number of electors appointed, is duly elected President of the United States for four years commencing on the 4th day of March, 1881."

"And I do further declare that Chester A. Arthur, of the State of New York, having received a majority of the votes of the whole number of electors appointed, is duly elected Vice-President of the United States for four years commencing on the 4th day of March, 1881." [Loud applause on the floor and in the galleries.]

"The business for which the joint convention of the two Houses assembled having been completed, the Senate will return to its chamber."

The Senate accordingly retired from the hall.

In the House, on January 5th, a bill for the apportionment of Representatives was reported.

Mr. Springer, of Illinois: "Before the ques-

tion of reference is put, I wish to make some remarks with reference to the basis on which the bill has been prepared, and also in regard to the additional provision in reference to the election of members upon what is known as the principle of minority representation.

"I have deducted from the whole population of the United States the population of the Territories and of the District of Columbia, which ought not to be included in an estimate in reference to the number of members of Congress. Taking out the population of those Territories and the District, I find that the population of the States of the Union amounts to 49,369,965. That amount divided by the number 293, the present number of members of the House, gives 168,498 as the ratio of population for one member of this House. Taking the population of each State and dividing it by that ratio will give the number of Representatives to which each State will be entitled upon full ratio, and the fractions over 100,000 which it is proposed shall entitle the States to additional members, will bring the whole number up to the full quota, 293.

"There are two States which have fractions coming very near to 100,000, which States may be the subject of special consideration hereafter. The State of Massachusetts will have a fraction of 98,106, and Florida will have a fraction of 98,068. If Representatives are allowed to those States on account of such fractions, then the State of Florida will have two members, and Massachusetts will have her present number; and in that event the whole number of Representatives will be increased to 295. Otherwise Massachusetts would lose one member. I call attention to the losses and gains of the several States under the proposed bill, as follows:

"The following States, by the bill which I have introduced, lose one member each: Alabama, Florida, Indiana, Illinois, Louisiana, Maine, Massachusetts, Maryland, New Hampshire, Ohio, Vermont, Tennessee.

"Pennsylvania loses two members.

"New York loses three members.

"The following States gain one member each: Arkansas, California, Iowa, Michigan, Mississippi, South Carolina, West Virginia.

"The following States gain two members each: Minnesota, Nebraska.

"The following States gain three members each: Kansas, Texas.

"One word now in reference to the principle of minority representation contained in this bill. It provides for dividing States having more than two members into districts having three members each, as far as possible. Where there shall be a fraction of two members then there will be a district having five members, and where there is a fraction of one member then there will be one district having one member. In each district of three members the voters will be entitled to vote but for two members, thus securing absolutely to the mi-

nority one member. In districts having five members each voter would be entitled to vote for but three members. I state this for the purpose of calling the attention of members of the House to the fact that this bill embodies more than a mere apportionment, and relates to the election of members of this House upon a principle different from the one heretofore adopted. I therefore think the reference of this bill should be properly to the Committee on Elections."

The previous question was seconded, and the main question ordered.

The House divided; and the tellers reported that there were—yeas 94, nays 34; and the bill was referred to the Select Committee on the Census.

Mr. Cox, of New York, subsequently said: "It appears that on the census of 1880, by the increase from 293 to 294, Massachusetts gains 1; by the increase to 295, Louisiana gains 1; by the increase to 296, Pennsylvania gains 1; by the increase to 297, Maryland gains 1; by the increase to 298, New York gains 1; by the increase to 299, Alabama gains 1; and when the number of Representatives is increased to 300, one of the striking features of the table appears. It is a curious eccentricity of mathematics—a paradox. The paradox is that Alabama loses, at 300, the Representative she gained at 299, and Texas and Illinois gain 1 each. At 301, Alabama regains the Representative so lost; by the increase to 302, Florida gains 1; by the increase to 303, Ohio gains 1; by the increase to 304, North Carolina gains 1; by the increase to 305, Tennessee gains 1; by the increase to 306, Pennsylvania gains 1; by the increase to 307, New York gains another, making two gains over 293, under the census of 1880, but still New York even then loses 1 from her present number assigned her under the apportionment of 1870.

"Compared with the present number, under the census of 1870, each member can make his own calculation as to gains and losses. There are losses. There always will be during a lapse of ten years. The largest House we ever had before 1863 was under the census of 1830. Massachusetts then had 20 members; now she has 11. New York then had 40 members; now she will not hold her present number, 33, unless the number of members is 307. Virginia at one time had 23; now she has 9. New Hampshire once had 6; now she has 3. The losses are comparative, and every apportionment has witnessed such reductions. Vermont and New Hampshire may gain in population, but not relatively. They must lose in this apportionment, unless we make the number of members inordinately large. But all this is to be judged on a scrutiny of the tables. How high we must run the number of members so that no State will lose, members can compute for themselves from the data to be printed."

Mr. Cox, by unanimous consent, introduced

a bill (H. R. No. 6958) making an apportionment of Representatives in Congress among the several States under the tenth census; which was read a first and second time, referred to the Joint Select Committee on the census, and ordered to be printed.

The bill is as follows:

An act making an apportionment of Representatives in Congress among the several States under the tenth census.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, After the 3d of March, 1883, the House of Representatives shall be composed of three hundred and one members, to be apportioned among the several States as follows:

Alabama, 8; Arkansas, 5; California, 5; Colorado, 1; Connecticut, 4; Delaware, 1; Florida, 1; Georgia, 9; Illinois, 19; Indiana, 12; Iowa, 10; Kansas, 6; Kentucky, 10; Louisiana, 6; Maine, 4; Maryland, 6; Massachusetts, 11; Michigan, 10; Minnesota, 5; Mississippi, 7; Missouri, 13; Nebraska, 3; Nevada, 1; New Hampshire, 2; New Jersey, 7; New York, 31; North Carolina, 8; Ohio, 19; Oregon, 1; Pennsylvania, 26; Rhode Island, 2; South Carolina, 6; Tennessee, 9; Texas, 10; Vermont, 2; Virginia, 9; West Virginia, 4; Wisconsin, 8.

SECTION 2. Whenever a new State is admitted to the Union, the Representative or Representatives assigned to it shall be added to the number.

SEC. 3. In each State entitled under this apportionment the number to which such State may be entitled in the Forty-eighth and each subsequent Congress, shall be elected by districts composed of contiguous territory, and containing as nearly as practicable an equal number of inhabitants, and equal in number to the Representatives to which such State may be entitled in Congress, no one district electing more than one Representative.

Subsequently the Committee on the Census made their report.

Mr. Cox: "I am directed by the Committee on the Census to report, as a substitute for House bill No. 6958, a bill (H. R. No. 7026) making an apportionment of Representatives in Congress among the several States under the tenth census. The majority fix the number of members under the tenth census at three hundred and eleven, and the minority, in their amendment, at three hundred and nineteen."

The bill reported by Mr. Cox from the Committee on the Census is as follows:

Be it enacted, etc., That after the 3d of March, 1883, the House of Representatives shall be composed of three hundred and eleven members, to be apportioned among the several States, as follows: Alabama, eight; Arkansas, five; California, five; Colorado, one; Connecticut, four; Delaware, one; Florida, two; Georgia, ten; Illinois, nineteen; Indiana, thirteen; Iowa, ten; Kansas, six; Kentucky, ten; Louisiana, six; Maine, four; Maryland, six; Massachusetts, eleven; Michigan, ten; Minnesota, five; Mississippi, seven; Missouri, fourteen; Nebraska, three; Nevada, one; New Hampshire, two; New Jersey, seven; New York, thirty-two; North Carolina, nine; Ohio, twenty; Oregon, one; Pennsylvania, twenty-seven; Rhode Island, two; South Carolina, six; Tennessee, ten; Texas, ten; Vermont, two; Virginia, ten; West Virginia, four; and Wisconsin, eight.

The accompanying report is as follows:

The Committee on the Census, to whom was referred the question of apportionment among the several States under the tenth census, beg leave to report the following bill, which enacts that after the 3d of March, 1883, the House of Representatives shall be

composed of three hundred and eleven members. For the distribution of said members in detail, the committee refer to the bill. There were differences of opinion among the members of the committee as to the number, some being for more and some for less than the above number, but, to avoid delay, and to bring the matter speedily before the House, the majority of the committee have concluded to report the accompanying bill.

The amendment, in the nature of a substitute reported by Mr. Sherwin on behalf of the minority of the committee, is as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That from and after the 3d day of March, 1883, the House of Representatives shall be composed of three hundred and nineteen members, to be apportioned among the several States as follows:

To the State of Alabama, eight members; to the State of Arkansas, five members; to the State of California, six members; to the State of Colorado, one member; to the State of Connecticut, four members; to the State of Delaware, one member; to the State of Florida, two members; to the State of Georgia, ten members; to the State of Illinois, twenty members; to the State of Indiana, thirteen members; to the State of Iowa, eleven members; to the State of Kansas, six members; to the State of Kentucky, eleven members; to the State of Louisiana, six members; to the State of Maine, four members; to the State of Maryland, six members; to the State of Massachusetts, twelve members; to the State of Michigan, eleven members; to the State of Minnesota, five members; to the State of Mississippi, seven members; to the State of Missouri, fourteen members; to the State of Nebraska, three members; to the State of Nevada, one member; to the State of New Hampshire, two members; to the State of New Jersey, seven members; to the State of New York, thirty-three members; to the State of North Carolina, nine members; to the State of Ohio, twenty-one members; to the State of Oregon, one member; to the State of Pennsylvania, twenty-eight members; to the State of Rhode Island, two members; to the State of South Carolina, six members; to the State of Tennessee, ten members; to the State of Texas, ten members; to the State of Vermont, two members; to the State of Virginia, ten members; to the State of West Virginia, four members; to the State of Wisconsin, eight members.

SECTION 2. Whenever a new State shall be admitted into the Union, the Representative or Representatives assigned to it shall be additional to the number, three hundred and nineteen, herein provided for.

SEC. 3. In each State entitled under this apportionment, the number to which such State may be entitled in the Forty-eighth and each subsequent Congress shall be elected by districts composed of contiguous territory, and containing as nearly as practicable an equal number of inhabitants, and equal in number to the Representatives to which such State may be entitled in Congress, no one district electing more than one Representative.

In the House, on February 3d, an amendment was proposed, making the number of members three hundred and seven.

Mr. Sherwin, of Illinois: "There is another question, Mr. Speaker, connected with this important matter of representative government. That is, that not only is it made the duty of Congress to adopt a representative system adequate to the needs of the country and distributed properly among the people of the country, but that they shall also see that every man who by law has a right to vote for the members so provided for shall be free to vote and

exercise all the privileges which the law gives him without restraint or molestation; otherwise our enactments here are futile and our laws are vain.

"Some gentlemen have said that this apportionment is easy to be made because it is a mere question of arithmetic. Now, it is more than a question of arithmetic. It is a redistribution of political power. To be sure, this distribution is made upon arithmetical principles. But it is not a question of arithmetic only.

"The change of a divisor from three hundred and one to three hundred and eleven or three hundred and nineteen may change the political status of this House. It may change the political organization of the electoral college, and therefore it does assume a political aspect. But, looking at the facts as they exist to-day, as sensible men, we know we can not get rid of it, because it is a political question, a redistribution of power that will not affect this Congress, but that will affect five Congresses hereafter to be elected, that will extend for five Congresses to come, and that shall not only affect them but shall affect the next two presidential elections. Not only that, but it will affect the legislation in those next five Congresses. It will affect your tariff laws or legislation. It will affect your legislation on the monetary matters of this country. It will affect your legislation upon education. It will affect your legislation upon all great questions that divide the parties of this country. These questions are only reached through parties; and as they are reached through parties this apportionment is of necessity a party question, and assumes a political aspect from its very nature and object.

"There have been three bills introduced before this House: the bill of the gentleman from New York [Mr. Cox], providing for three hundred and one members; the bill of the majority of the committee, providing for three hundred and eleven members; the bill that was presented by myself, and is sustained by the minority with but one exception, providing for three hundred and nineteen members. Now, in discussing these ratios, all the principles involved in this subject can be seen and understood. The same method of arriving at the conclusions can be applied to any one of the numbers that is applied to these.

"Upon the basis of three hundred and one Representatives each of the following-named States gain one member: Arkansas, South Carolina, Mississippi, West Virginia, California, Iowa, and Michigan; Nebraska and Minnesota each gain two, Kansas three, and Texas four—a gain of eighteen in all, of which the Democratic States have eight and the Republican States ten.

"The losses upon a basis of three hundred and one are one each for the States of Florida, Indiana, Maine, New Hampshire, Ohio, Pennsylvania, Tennessee, and Vermont, and two in New York, of which losses the certainly Demo-

cratic States sustain two and the Republican States eight, making a net gain to the certainly Democratic States of six and to the Republican States which are sometimes Democratic of two. The eighteen States not named neither gain nor lose.

"Upon a basis of three hundred and eleven members fifteen States gain altogether twenty-two members, namely: Arkansas, California, Georgia, Iowa, Michigan, Mississippi, Missouri, North Carolina, South Carolina, Virginia, and West Virginia, gain one each; Minnesota and Nebraska two each; Kansas three, and Texas four; of which gain the certainly Democratic States have twelve and the other States ten.

"Four States, Maine, New Hampshire, Vermont, and New York, each lose one, leaving the net gain to the certainly Democratic States twelve and to the Republican States six. The other nineteen States neither gain nor lose.

"Upon a basis of three hundred and nineteen, the bill of the minority, twenty-one States gain twenty-nine members, namely, Arkansas, California, Mississippi, North Carolina, South Carolina, Georgia, Illinois, Iowa, Missouri, Ohio, Kentucky, Massachusetts, New York, Pennsylvania, Virginia, and West Virginia, each one; Nebraska, Minnesota, and Michigan, each two; Kansas three, and Texas four; of which number the certainly Democratic States gain thirteen and the other States sixteen.

"Upon the basis of three hundred and nineteen, three States, Maine, New Hampshire, and Vermont, each lose one, making the net gain to the certainly Democratic States thirteen, and to the other States thirteen, and producing an equality of gains between the States certainly Democratic and the other States.

"To recapitulate: Upon a basis of three hundred and one, the certainly Democratic States have a net gain of six; the other States have a net gain of two. Upon a basis of three hundred and eleven, the certainly Democratic States have a net gain of twelve; the other States have a net gain of six; Upon a basis of three hundred and nineteen, the certainly Democratic States have a net gain of thirteen; the other States have a net gain of thirteen.

"Fewer States (only three) lose upon the last basis than upon either of the others.

"Fewer States (fourteen) stand still, without gain or loss, than upon the other rates. And four of these fourteen States, namely, Oregon, Nevada, Colorado, and Delaware, could not gain upon any practicable ratio, thus leaving only ten States stationary.

"The gains and losses under the different ratios are owing to the change of divisor and consequent change of fractions. Upon the basis of three hundred and one, the number of Representatives upon an even division would be but two hundred and eighty-two, and the twenty highest fractions are therefore each given a Representative to make the number three hundred and one.

"Upon a basis of three hundred and eleven,

and also three hundred and nineteen, members are given to eighteen fractions. The States which gain a member upon a fraction at three hundred and nineteen, which do not have them at three hundred and eleven, are Illinois, Kentucky, Massachusetts, Michigan, New York, Ohio, and California.

"The basis of three hundred and twenty-two would give a net gain of thirteen to the States certainly Democratic, and sixteen to the other States. But in the interest of fairness the minority chose three hundred and nineteen instead of three hundred and twenty-two.

"I do not contend that the different sections of the country should necessarily gain equally in their representation. Of course that must depend upon the population of the States and sections. But, as will be seen by the examples I have given, there is quite a latitude within which changes may be made, and within those limits is the field of dispute, over which is waged the war of debate, upon which also are sought to be gained advantages which could not be secured upon a division based upon whole numbers only and not partly upon fractions. This being so, we must recognize the fact, and select that number for a ratio which will be most fair and equitable in its operation.

"Another point worth observing is that all the gains on present representation between the numbers three hundred and one and three hundred and eleven fall to the Southern States, the South, as I have before pointed out, at the latter number having a net gain of six; while between the numbers three hundred and eleven and three hundred and nineteen all the gains but one are in the Northern States, and having arrived at three hundred and nineteen the gains between North and South are equal. Another thing to be observed is that the greatest loss which the New England and central States sustain actually and relatively is at three hundred and one. The central States do not hold their own until they pass three hundred and eleven.

"Can any member in this House, in the face of these figures, vote for either of the numbers three hundred and one or three hundred and eleven? The only reasonable excuse for so doing is that three hundred and nineteen makes the House too large. It is but eight larger than three hundred and eleven. Who can say an addition of eight or eighteen would be at all perceptible in this House?"

Mr. Crowley, of New York: "Every apportionment bill pending in this House bases representation upon numbers only. That was the principle of the old Constitution, under which nine censuses were taken and nine apportionments made; but under section 2 of the fourteenth amendment voters as well as numbers may be taken into the account in apportioning Representatives among the respective States; and when any State denies to any of its qualified male citizens, being twenty-

one years of age, the right to vote for any of the officers specified in the fourteenth amendment, in my judgment that State should be denied representation in this House in the proportion which it denies the right of voting to any of its male citizens otherwise qualified.

"Turning to the Constitutions of the States, we find that Massachusetts and Connecticut disqualify citizens on educational grounds. I am not going to criticise the wisdom of those States. I am not standing here to attack either of those States or any others; and let me say in passing that the question of education is becoming one of the paramount questions of the present time. Thoughtful men, who are anxious for the perpetuity of our institutions, who are looking to the future welfare of this republic, are scanning closely the Constitution to find whether or not there are any powers in it authorizing Congress to take control of the whole subject of education for the nation and for all the States of the nation. But let me say that while Massachusetts and Connecticut have imposed an educational qualification which debars certain citizens in those States from voting for the officers enumerated in section 2 of the fourteenth amendment, Massachusetts, Delaware, Georgia, New Hampshire, Pennsylvania, Rhode Island, Tennessee, Texas, and Virginia have added a property qualification, either in regard to the amount of property which the voter shall possess, or in regard to the payment of poll-taxes, or county, State, or municipal taxes.

"Let me call attention somewhat to the effect of this in regard to representation in this House. The State which I have the honor to represent in part upon this floor sends here under the apportionment act of 1872 thirty-three Representatives. In the last election of those Representatives the total vote for Representatives in Congress in each of those thirty-three districts was not less than 23,000; and in the Erie district, where the highest vote was cast, there was a little upward of 45,000 votes cast for candidates for Representative in this House.

"Now turn to the State of Rhode Island. Rhode Island in the last presidential election cast 29,210 votes, all told, for the presidential electors, and both of the members from the first and second congressional districts of that State had had cast for them and for their opponents all told in both of those districts only 28,964 votes. That is the aggregate of both districts. In twenty-three of the congressional districts of the State of New York there was a larger vote than 28,964 cast for congressional candidates in each and every one of those twenty-three congressional districts.

"Now, Mr. Speaker, the gentleman from New York [Mr. Cox], chairman of the Committee on the Census, asks, in regard to the effect of the fourteenth amendment, a question which I think should receive an answer at this time and in this place.

"The first question which arises under this second section of the fourteenth amendment is, What is a denial or abridgment of the right to vote as contemplated? Must it be by law or by individuals? What constitutes a denial or abridgment if otherwise than by law? What is the amount of private force and intimidation, or the kind of device or fraud, which constitutes a denial or abridgment? The last act of apportionment was passed on the 2d of February, 1872. It did not pretend to settle this or anything else as to this fourteenth amendment. It re-enacted the clause of the Constitution, and fixed the power which must deny or abridge.

"It says 'should any State' deny or abridge. It does not say person or community or other organism; so that, in so far as any interpretation may be drawn from the law of 1872, the only constraint on suffrage must be from the State and by legal enactment. No practical application has been made of the constitutional clause or the law. It has been hitherto a dead letter. Nor is it possible now, with any known data ascertainable with reasonable accuracy, to apply either the Constitution or the law to the apportionment.

"Now, let me say, sir, that the answer to the question asked by the chairman of the Committee on the Census has been given by the Supreme Court of the United States at the October term in 1879, in the matter of the Commonwealth of Virginia and J. D. Coles, petitioner. That was a writ of *habeas corpus*, coming up from the State of Virginia, in regard to a county judge in one of the counties of that State, who was charged with having refused to select jurors under the provisions of the recent amendments to the Constitution of the United States.

"The Supreme Court in rendering judgment—Justice Strong delivering the opinion—holds in regard to that the following, to which I particularly ask the attention of the House. In speaking of these recent constitutional amendments, and the legislation necessary to carry them into operation, the court observes, 'All of the amendments derive much of their force from this latter provision.' That is, the provision existing in Congress to pass appropriate legislation to enforce them:

"It is not said the judicial power of the General Government shall extend to enforcing the prohibitions and to protecting the rights and immunities guaranteed. It is not said that branch of the Government shall be authorized to declare void any action of a State in violation of the prohibitions. It is the power of Congress which has been enlarged. Congress is authorized to enforce the prohibitions by appropriate legislation. Some legislation is contemplated to make the amendments fully effective. Whatever legislation is appropriate, that is adapted to carry out the objects the amendments have in view—whatever tends to enforce submission to the prohibitions they contain, and to secure to all persons the enjoyment of perfect equality of civil rights, and the equal protection of the laws against State denial or invasion, if not prohibited—is brought within the domain of congressional power. Nor does it make any difference that such legislation is restrictive of what the State might have done before the constitutional amendment was adopted.

"And let me say here, all these constitutional qualifications or limitations which exist in these ten States I have named, I believe without exception, unless in the case of one or two of them, were passed before the adoption

of the fourteenth amendment to the Constitution :

"The prohibitions of the fourteenth amendment are directed to the States, and they are to a degree restrictions of State power. It is these which Congress is empowered to enforce, and to force against State action, however put forth, whether that action be executive, legislative, or judicial. Such enforcement is no invasion of State sovereignty. No law can be which the people of the States have, by the Constitution of the United States, empowered Congress to enact. This extent of the powers of the General Government is overlooked when it is said, as it has been in this case, that the act of March 1, 1875, interferes with State rights. It is said the selection of jurors for her courts and the administration of her laws belong to each State; that they are her rights. This is true in the general; but in exercising her rights a State can not disregard the limitations which the Federal Constitution has applied to her power. Her rights do not reach to that extent. Nor can she deny to the General Government the right to exercise all its granted powers, though they may interfere with the full enjoyment of rights she would have if those powers had not been thus granted. Indeed, every addition of power to the General Government involves a corresponding diminution of the governmental powers of the States. It is carved out of them.

"We have said the prohibitions of the fourteenth amendment are addressed to the States. They are: 'No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; . . . nor deny to any person within its jurisdiction the equal protection of the laws.'

"And now the court, in passing upon the exact phraseology used in section 2 of the fourteenth amendment, says:

"A State acts by its legislative, its executive, or its judicial authorities. It can act in no other way. The constitutional provision, therefore, must mean that no agency of the State, or of the officers or agents by whom its powers are exerted, shall deny to any person within its jurisdiction the equal protection of the laws. Whoever by virtue of public position under a State government deprives another of property, life, or liberty, without due process of law, or denies or takes away the equal protection of the laws, violates the constitutional inhibition, and as he acts in the name and for the State, and is clothed with the State's power, his act is that of the State. This must be so, or the constitutional prohibition has no meaning. Then the State has clothed one of its agents with power to annul or to evade it.

"But the constitutional amendment was ordained for a purpose. It was to secure equal rights to all persons; and, to insure to all persons the enjoyment of such rights, power was given to Congress to enforce its provisions by appropriate legislation. Such legislation must act upon persons, not upon the abstract thing denominated a State, but upon the persons who are the agents of the State in the denial of the rights which were intended to be secured.

"In 1876, in the fierce struggle for political power in this country, it was supposed that every State in the Union had polled its full vote for President in that year. New York, my own State, cast upward of a million in that election, the largest vote ever cast up to the election of 1880. Four years pass away. We have another presidential election in 1880, and it is fair to assume that the lapse of four years would have brought increased numbers of voters in all of the States of the Union, but it will be found that in certain States the vote cast in 1880 for presidential electors is con-

siderably less than that cast in 1876. I have stated as a reason for my opposition to the passage of any apportionment bill by this Congress that every one of these bills for the apportionment of Representatives is based upon numbers without taking into the count voters. Under the Constitution as amended, I regard voters as well as numbers a basis for an apportionment bill, where citizens are denied the right to vote by State action. I am not speaking in a partisan sense; but it is alleged and believed that in some parts of the Union, in some of the States in this Union or in some sections of the country, there exist and have existed fraud, intimidation, and violence, by which means a large number of voters have been denied the right of voting in elections in the past. I do not assert, sir, whether that is so or not. The allegation has been made, and it is believed in a portion of this Union that this condition of affairs absolutely exists.

"I am in favor of having one of the committee of this Congress, or a select committee, if you please, raised, which shall investigate the whole question of disqualification, either educational or property, in all these States of the Union where constitutional prohibitions against the right of suffrage are alleged to exist; and I would have this committee look into this whole question and report to Congress what qualifications or disqualifications exist in all sections of the country to deprive citizens of the right to vote."

Mr. Thompson, of Kentucky: "Mr. Speaker, I do not see why we should go into this matter at all. It is a dangerous subject, to say the least of it, when we see what progress has been made in this direction by the legislation of Congress during the last forty years. The year 1842 was the first time that Congress ever undertook to interfere with the regulations of the States on this subject. Then it was that the moiety system was first adopted, giving to each State on even divisions so many Representatives, and to each State having a fraction greater than one half an additional member. At that time another change was introduced. Theretofore, whenever it was necessary to apportion representation, the ratio was first found, the populations of the States divided by that ratio, and whatever number of members they might obtain by that division was given to them. Then for the first time a limit was fixed upon the membership of this House, the number being fixed at two hundred and forty-one, and the ratio being adopted to produce that result. Theretofore a ratio was determined, and the number of members was left to be what it might under the ratio determined. A new system was devised, carrying with it the moiety system, or some system allowing fractional representation. Then for the first time what is now known as the district system was adopted. How have we progressed in our legislation on this subject? We have gone on until Congress has assumed almost entire con-

trol of the election of members in the States. In 1870, 1871, and 1872, when the Republican party was in power in both branches of Congress, they seized upon this whole subject; they forced upon the States the ballot system, which many of them do not like, and which produces more fraud in one day than the *viva voce* system will in a hundred years, as those of us who have lived under both systems well know. We hear more of fraud, corruption, ballot-box stuffing, and intimidation in a single contested-election case in this House than the whole State of Kentucky furnishes in all our elections for State officers during twenty-five years.

"Is it wise for this House to interfere? What is the object? Congress has thus interfered to direct the States as to the time when they shall elect their Representatives, fixing a uniform day, thereby throwing the power and control of the Federal Government, with its innumerable supervisors and deputy-marshals, into the State elections which occur on the same day. Then came the legislation providing for supervisors and deputy-marshals, of whom we have heard so much. Complete machinery has been provided by the central Government here to dominate the States in their elections. I am opposed to this interference on the part of the Government with the States, even for the purpose of dictating to them that they shall elect by districts. It is inconsistent with the theory upon which our Government is based. If you will go back and look at the history of that provision in the Constitution under which this action is had, you will find that nine out of the thirteen original States which adopted that Constitution adopted it with the distinct understanding that Congress never would exercise that latent power except for the purpose of self-preservation, as in cases where a State refuses to elect Representatives, or from some other cause could not.

"Under what section of the Constitution, Mr. Speaker, does Congress claim power to pass these clauses regulating the elections of Representatives by the States? There is but one—in these words:

"The times, places, and manner of holding elections for Senators and Representatives shall be prescribed in each State by the Legislature thereof; but the Congress may at any time by law make or alter such regulations, except as to the places of choosing Senators.

"And no provision of that instrument aroused so much opposition to its adoption by the States as this. Nearly all the conventions placed upon record their solemn protest against its use being ever resorted to, except as a matter of self-preservation. Opposition was not confined to sections. In fact, State rights had its birth and earliest propagandist and defender among the New England States and around Plymouth Rock. Massachusetts, in her convention, said:

"The convention do, therefore, recommend that the following alterations and provisions be introduced into the said Constitution:

"SECTION 3. That Congress do not exercise the powers vested in them by the fourth section of the first article, but in cases when a State shall neglect or refuse to make the regulations therein mentioned, or shall make regulations subversive of the rights of the people to a free and equal representation in Congress, agreeably to the Constitution.

"Thus it will be seen the old State of Massachusetts, always zealous of her rights as a State, left a record to future Congresses, in the following language:

"And the convention do, in the name and in behalf of the people of this Commonwealth, enjoin it upon their Representatives in Congress, at all times, until the alterations and provisions aforesaid shall have been considered, agreeably to the fifth article of the said Constitution, to exert all their influence, and use all reasonable and legal methods, to attain a ratification of the said alterations and provisions, in such manner as is provided in the said article.

"I will take South Carolina next, and part of the record of her convention, which adopted the Constitution for her people:

"And whereas it is essential to the preservation of the rights reserved to the several States, and the freedom of the people, under the operations of a general government, that the right of prescribing the manner, time, and places of holding the elections to the Federal Legislature, should be for ever inseparably annexed to the sovereignty of the several States, this convention doth declare that the same ought to remain, to all posterity, a perpetual and fundamental right in the local, exclusive of the interference of the General Government, except in cases where the Legislatures of the States shall refuse or neglect to perform and fulfill the same, according to the tenor of the said Constitution.

"It is grandly sublime to study the history of those times and men after a new nation had been born, to note the unanimity of sentiment of their jealous vigilance for the rights of the States and the people. The instruction of the convention to its Representatives in Congress is of no doubtful meaning, namely:

"Resolved, That it is a standing instruction to all such delegates as may hereafter be elected to represent this State in the General Government to exert their utmost abilities and influence to effect an alteration of the Constitution conformably to the foregoing resolutions.

"The State of New Hampshire follows next, whose conventions took under consideration this particular section of the Constitution, and upon her record are found the following emphatic entries:

"The convention do therefore recommend that the following alterations and provisions be introduced into the said Constitution: 3. That Congress do not exercise the powers vested in them by the fourth section of the first article but in case when a State shall neglect or refuse to make the regulations therein mentioned, or shall make regulations subversive of the rights of the people to a free and equal representation in Congress; nor shall Congress in any case make regulations contrary to a free and equal representation.

"And the convention do, in the name and in behalf of the people of this State, enjoin it upon their Representatives in Congress at all times until the alterations and provisions aforesaid have been considered agreeably to the fifth article of the said Constitution, to exert all their influence and use all reasonable and legal methods to obtain a ratification of the said

alterations and provisions in such manner as is provided in the said article.

"The wise statesmanship of Virginia, whose vigilance and prudence had a controlling influence from the Declaration of Independence in 1776 to the adoption of the Constitution in 1787, has left upon its record a declaration on this amendment strong, emphatic, and to the point, in the following words, namely :

"XVI. The Congress shall not alter, modify, or interfere in the times, places, or manner of holding elections for Senators and Representatives, or either of them, except when the Legislature of any State shall neglect, refuse, or be disabled by invasion or rebellion to prescribe the same.

"They placed upon the same record a perpetual instruction to their future Representatives in Congress of the United States, namely :

"And the convention do, in the name and behalf of the people of this Commonwealth, enjoin it upon their Representatives in Congress to exert all their influence, and use all reasonable and legal methods, to obtain a ratification of the foregoing alterations and provisions, in the manner provided by the fifth article of the said Constitution ; and in all congressional laws to be passed in the mean time to conform to the spirit of these amendments, as far as the said Constitution will admit.

"The next in order is now one of the most powerful and influential States in the Union ; and I ask to be pardoned for quoting from a distinguished Senator from the State of Louisiana, Mr. White, who I believe was a native of New York, when he said he 'referred with pride and pleasure to the proceedings of her convention upon this important point' :

"New York was not then a large State in the comparison ; and yet the cautious jealousy of her statesmen against this wanton exercise of Federal power over her local elections was not the less, because she had at that day the less to fear and to lose from the assumption. Her record is more full as to this grant of power than that of any other State, as her convention seem to design to set up every guard against an abuse of its exercise. They therefore, in express terms, first put their construction upon the clause of the Constitution as they found it, in the following language, to wit : 'That nothing contained in the said Constitution is to be construed to prevent the Legislature of any State from passing laws at its discretion, from time to time, to divide such State into convenient districts, and to apportion its Representatives to and among such districts.'

"After this emphatic declaration of the rights of the States, the Convention of New York proceeded to make their ratification of the Constitution in this language :

"Under these impressions, and declaring that the rights aforesaid are consistent with the said Constitution, and in confidence that the amendments which shall have been proposed to said Constitution will receive an early and mature consideration, we, the said delegates, in the name and in the behalf of the people of the State of New York, do, by these presents, assent to and ratify the said Constitution. In full confidence, nevertheless, that, until a convention shall be called and convened for proposing amendments to the said Constitution . . . that the Congress will not make or alter any regulation in this State respecting the times, places, and manner of holding elections for Senators or Representatives, unless the Legislature of this State shall neglect or refuse to make laws or reg-

ulations for the purpose, or from any circumstance be incapable of making the same ; and that in those cases such power will only be exercised until the Legislature of this State shall make provision in the premises.

"The Convention of New York went even further than this. They looked forward with prophetic vision at the encroachments of the Federal power, and to warn them of the danger of centralization they proceeded to instruct their future Representatives against that encroachment, to wit :

"And the convention do, in the name and behalf of the people of the State of New York, enjoin it upon their Representatives in the Congress to exert all their influence and use all reasonable means to obtain a ratification of the following amendments to the said Constitution in the manner prescribed therein, and in all laws to be passed by Congress, in the mean time, to conform to the spirit of the said amendments, as far as the Constitution will admit.

"The amendment proposed by the convention follows, and is in this language, namely :

"That the Congress shall not make or alter any regulation in any State, respecting the times, places, and manner of holding elections for Senators or Representatives, unless the Legislature of such State shall neglect or refuse to make laws or regulations for the purpose, or from any circumstance be incapable of making the same ; and then only until the Legislature of such State shall make provisions in the premises : *Provided*, That Congress may prescribe the time for the election of Representatives.

"On that account, Mr. Speaker, because there is no necessity that this law shall be reenacted by this Congress, because it endangers this apportionment bill and may prolong indefinitely this debate, because, to say the least of it, it is of doubtful constitutionality, because it is almost in the nature of things, where any State dares to violate it, which she may do, we can do no more than exclude her Representatives from the halls of the House, I hope it will not be insisted upon. I ask these gentlemen who now contend so stubbornly for it, suppose a State, according to the rule as you understand it, does not make her territory contiguous ; or suppose every district of that State is based on contiguous territory save one, are you going to exclude all the members of such a State because she has not complied in one instance with what you understand to be the requirement of this law ? This power was given to you to bring members into Congress, not to drive them out. Will you turn around and use it for that purpose ? Will you say to New York, with thirty-three members here upon this floor, If your Legislature does not square itself according to the rule which we prescribe, we will exclude your thirty-three members, although you have five million people, and they will go unrepresented upon this floor ? How do you propose to do it ? Is it not a *brutum fulmen* which you issue against the State, directing them to do this thing, without the power on your part except by the exclusion of its representation to compel it to do it ?

"Now, Mr. Speaker, I have little more, if

anything, to say on that subject. I do not wish to invoke sectional issues here, nor do I wish to get up a partisan strife on this subject; but I do say, as the law stands on the statute-book it gives to gentlemen on the other side all they ask, and it is unnecessary to ask us on this side to re-enact it, or meddle with elections in the States against the protest of our forefathers, made, as it has been, so often and so emphatically.

"The other objection alleged by the gentleman from New York against the bill of the majority was, if I recollect aright, the increase of the number of the House. That is a question, of course, which each member must consider for himself, and we have all equal lights before us and can form each our own opinion as to whether the country can be better served by a smaller or larger House. I listened to what he had to say on that subject, and when he cited his own great State with a small Legislature, as he said, probably one that dates back for sixty years and not increased through that whole time, as a fair sample of what a State can be and what it can do with a small Legislature, I thought it was a little unfortunate, because, out in our part of the world at least, New York is not considered the freest State from fraud, nor her Legislature the most incorruptible in the Union. We have never heard any charge against New Hampshire, which I believe has a Legislature like a great big town-meeting, like that which is made against the Legislature of New York, of having big railroad bills and measures for railroad interests lobbied through it, and that men were elected to it who were controlled and held in hand and sent there, as it is understood, to be in a large measure the attorneys and promoters of railroad corporations and banking interests. I do not know that it would be better for his State to have an increased representation in her Legislature, but I am satisfied it would do her no harm.

"As far as we of the committee are concerned, and at least as far as I personally am concerned, in reference to the number of Representatives, I do not ask nor demand the House to be increased to any extraordinary number. It certainly seems to me when we increase the number eighteen, as the majority bill in this House proposes to do on an increased population of eleven millions, it is asking no big increase, because it fixes the representation at over five hundred and fifty thousand population for each of the new members who can enter this House on account of the increase. Is that increase an expansion too far? Do we not derive some practical benefit from it? Have we not the history of the world before us, which shows that a large representative body is a safer and greater protector to the liberties of the people than a smaller one? The gentleman would like to reduce this House within the narrow limits of the Senate. Are we to have no popular branch of this Government;

and are the people to have no voice in it? Are we to hold it up as a model republic, and at the same time stifle the direct voice of the people? Where else is their power directly felt in our system of government save in this House?"

On March 3d, the rules were suspended and the bill put upon its passage, and at the same time a vote was taken on the respective number of members proposed.

On the question of the number of Representatives fixed at three hundred and twenty-two, the vote was—yeas 119, nays 132.

On the question with the number fixed at three hundred and nineteen, the vote was—yeas 136, nays 123.

The bill was then passed—yeas 145, nays 113. No action was taken upon it in the Senate; and the session closed on March 3d.

SPECIAL SESSION OF THE SENATE.

At noon, on the 4th of March, Vice-President Arthur, who had just taken the oath of office, assumed the chair in the Senate, and the official proclamation calling a special session of that body was read. The chief object in calling this session was to enable the Senate to receive and act upon such appointments as the new President might desire to submit. The terms of office of twenty-five Senators had expired with the Forty-sixth Congress, and their successors were as follows:

STATE.	Former Senator.	New Senator.
California.....	Newton Booth.....	John F. Miller.
Connecticut.....	W. W. Eaton.....	Joseph R. Hawley.
Delaware.....	T. F. Bayard.....	T. F. Bayard.
Florida.....	Charles W. Jones.....	Charles W. Jones.
Indiana.....	Jos. E. McDonald.....	Benj. Harrison.
Maine.....	Hannibal Hamlin.....	Eugene Hale.
Maryland.....	William P. Whyte.....	A. P. Gorman.
Massachusetts.....	H. L. Dawes.....	H. L. Dawes.
Michigan.....	H. P. Baldwin.....	O. D. Conger.
Minnesota.....	S. J. R. McMillan.....	S. J. R. McMillan.
Mississippi.....	B. K. Bruce.....	J. Z. George.
Missouri.....	F. M. Cockrell.....	F. M. Cockrell.
Nebraska.....	A. S. Paddock.....	Chas. H. Van Wyck.
Nevada.....	William Sharon.....	J. G. Fair.
New Jersey.....	T. F. Randolph.....	Wm. J. Sewell.
New York.....	Francis Kernan.....	Thomas C. Platt.
Ohio.....	A. G. Thurman.....	John Sherman.
Pennsylvania.....	W. A. Wallace.....	John I. Mitchell.
Rhode Island.....	A. E. Burnside.....	A. E. Burnside.
Tennessee.....	J. E. Bailey.....	Howell E. Jackson.
Texas.....	S. B. Maxey.....	S. B. Maxey.
Vermont.....	G. F. Edmunds.....	G. F. Edmunds.
Virginia.....	R. E. Withers.....	William Mahone.
West Virginia.....	Frank Hereford.....	Johnson N. Camden.
Wisconsin.....	Angus Cameron.....	Angus Cameron.

The result of these changes was an equal political division of the Senate. There were 37 Republicans and 37 Democrats, while General Mahone, of Virginia, elected by the Readjuster wing of the Democratic party, and Judge Davis, of Illinois, were rated as independents. The President's Cabinet appointments, which were submitted on the second day of the session, were promptly confirmed. They took three members from the Senate, viz., Blaine, of Maine, Windom, of Minnesota, and Kirkwood, of Iowa, whose places were subsequently filled by the election of William P. Frye in Maine, and

the gubernatorial appointment of A. J. Edgerton in Minnesota and J. W. McDill in Iowa. The organization of the Senate threatened to be a matter of some difficulty on account of the equal political division, both parties indicating a purpose of insisting on controlling the composition of the committees and the election of officers. They accordingly held caucuses and arranged the membership of committees, the Republicans also selecting candidates for the offices. General Mahone and Judge Davis took no part in either caucuses. The Democratic list of committees was submitted in a resolution for their appointment by Mr. Pendleton on the 10th of March. The Republicans had declined to fill in the places reserved for their party according to custom, and the Democrats had arranged the entire membership, giving their opponents the customary minority of places. The Republicans determined at once to resist the adoption of the Democratic resolution. Mr. Davis, of Illinois, who had been named for the chairmanship of the Judiciary Committee, declined the place in a speech in which he defined his position. He had been elected to the Senate in 1877 unexpectedly to himself by a Legislature in which the Republicans had a plurality, but chiefly by Democratic votes. He explained his former connection with the Republican party, his participation in the Liberal movement of 1872, and his recent entirely independent attitude in politics, and declared that he should support the organization of the Senate as it stood. His closing words were: "Every good citizen should desire the success of the Administration, for we all ought to have a common interest in the glory and in the greatness of the republic. Measures intended to advance either shall have my cordial support. The President and his Cabinet are entitled to a fair hearing, and to be judged impartially by their acts. If they fail to justify the public confidence, it will be a misfortune which has overtaken other administrations having equally good intentions and prospects. I shall vote for the appointment of all these committees, except the Judiciary Committee. I wish to retain my old place on the Judiciary Committee, and, though I am thankful to my friends, I must decline the position of chairman." General Mahone did not appear in the chamber until the second day of the debate on the resolution appointing the committees, which occurred on the 14th of March. In answer to charges of desertion and bad faith made by Mr. Hill, of Georgia, he declared his position, claiming to be a Democrat in principle, but not to owe his position in the Senate to that party, and announcing his purpose to vote with the Republicans in organizing the chamber. The same day the Republican list of committees was prepared, but it was determined to postpone action until the vacancies then existing in the Senate had been filled. After General Mahone's position had been defined, the Democrats, having the casting vote

of the Vice-President against them, gave up the contest for the control of the committees. On the 18th of March the resolution submitting the Democratic list came up as the pending business, and a motion was made by Mr. Anthony to postpone it indefinitely. The result was 37 yeas and 37 nays, and the Vice-President announced, "The votes being evenly divided, the Chair will vote ay." A protest was entered by Mr. Saulsbury, of Delaware, against the right of the Vice-President to a casting vote in the organization of the committees. The Republican list of committees was then adopted by the same vote, Judge Davis acting with the Democrats and General Mahone with the Republicans.

The Democrats determined to make a resolute stand for the organization of the Senate itself, as it stood, and the retention of the existing Secretary, Sergeant-at-Arms, and clerks. The Republicans, on the other hand, resolved to contest their right and power to retain control of the subordinate offices of the body, and in caucus on the 23d of March nominated George C. Gorham for Secretary, and Henry Riddleberger, a Virginia Readjuster, and a leading supporter of Mahone, for Sergeant-at-Arms. The Democrats decided in caucus, on the day following, to oppose the adoption of a resolution for the election of Secretary, Sergeant-at-Arms, and other officers of the Senate, resorting to motions to adjourn and to go into executive session for the purpose of staving off action, as the Republicans had done to secure delay in constituting the committees. The motions involved in this plan of action were made the subjects of a series of speeches on both sides, in which attempts were made to justify the course persisted in by either party. Senator Davis, of Illinois, again defined his independent position. He explained that his previous vote, in regard to the committees, had been intended to sustain the existing organization of the Senate, but the control of the committees being changed, notwithstanding his vote, he now deemed it proper that the same party should complete the organization. He said that the majority entitled to control had been disclosed by the casting vote of the Vice-President. "However fleeting and fractional that majority may be, we are commanded to accept and obey it. The majority that chose the committees is fairly entitled to choose the officers of the Senate. One naturally goes with the other in order to perfect the organization. This conclusion will neither be delayed nor obstructed by any vote of mine, and it can not be reached too soon for the public interest. I do not regret at all that the new Administration, which has to confront the country with its policy, should have the control of both branches of Congress. The responsibility for measures to be proposed can not be avoided with the power to initiate legislation. The majority is not large enough to indulge in rash experiments, and the minority

is sufficiently strong to check any tendency to excess. Between these two elements, the great voice of independent opinion can always be heard with effect, and the country has every prospect of peace and prosperity." Judge Davis, accordingly, voted with the Republicans in favor of proceeding to the election of officers; but the dilatory tactics of the Democrats were kept up, and prevented the adoption of the resolution offered by Mr. Dawes, of Massachusetts, for that purpose. The contest, however, was continued through the entire month of April, the debate taking a wide range over the political field. General Mahone took occasion to defend the financial policy of the Readjusters in Virginia, and was answered by his colleague, General Johnston. Mahone's party attitude in the Senate was made the subject of severe criticism by Hill, of Georgia, and others, and several heated colloquies took place. The method of conducting political canvasses and elections in the South was brought under discussion, and the suffrage laws of some of the Northern States were denounced. There was scarcely a question of recent or current politics that was not made a subject of debate.

On the 27th of April the Republican Senators held a caucus for the purpose of considering whether they should consent to an executive session, at which the President's appointments could be acted upon. The question was referred to a caucus committee which was instructed to consider the situation and make a report of its conclusions. The efforts of this committee were directed mainly to ascertaining whether harmony could be secured in acting upon certain pending nominations. On the 22d of March, the last day on which an executive session had been held, the following names had been submitted by the President for appointment in the State of New York: Stewart L. Woodford to be District Attorney for the Southern District; Asa W. Tenney, District Attorney for the Eastern District; Louis F. Payn, Marshal for the Southern District; Clinton D. MacDougall, Marshal for the Northern District; and John Tyler, Collector of Customs at Buffalo. These men were known as more or less close political friends of Senator Conkling, and their appointment was presumed to be agreeable to him. The next day, March 23d, William H. Robertson was named for Collector of Customs at the port of New York; Edwin A. Merritt, the incumbent of that office, received the appointment of Consul-General at London, and General Adam Badeau was transferred to the position of *Chargé d'Affaires* to Denmark, Mr. Cramer being transferred to Switzerland. There were other important appointments submitted at the same time, but they gave no occasion for a contest. Mr. Robertson had been a pronounced opponent of Mr. Conkling in the leadership and management of the Republican party in New York, and it was known that his appointment was very distasteful to the

Senator. How far his opposition to its confirmation would be carried was not definitely known, and the chief object of this caucus committee, appointed April 27th, was to ascertain whether antagonism between him and the President could not be reconciled. The President disclaimed any purpose of offending Mr. Conkling or slighting his just claims to be consulted, but took the position that the collectorship at New York was a national office, over which there could be no local claims, and that he felt entirely free to make the appointment according to his own best judgment. He distinctly intimated a purpose to adhere to his former action, while Senator Conkling showed no disposition to abate his claim to a controlling voice in the selection of Federal officers in New York. The caucus was called together on the 3d of May, and decided to agree to executive sessions on the following days for the consideration of appointments, those which were uncontested being first acted on. On the 4th Mr. Dawes rose to explain the course of his party in persisting in the effort to elect the officers of the Senate, and, insisting on the right of its position, proposed a suspension of the contest in order that the President's appointments might be acted upon. By a unanimous vote the Senate went into executive session, confirmed several appointments, and took up the treaties with China. Seeing that it was the plan of Senator Conkling to secure, if possible, the confirmation of the uncontested appointments, including those within the State of New York, and then to induce the Senate to adjourn without acting upon the others, President Garfield, on the 5th of May, withdrew the names of Woodford, Tenney, Payn, MacDougall, and Tyler. The same day the Chinese treaties were ratified, and numerous appointments were confirmed.

The action of the President in withdrawing the other New York appointments brought the contest with Senator Conkling over that for the collectorship to a distinct issue, which the Senate could not avoid meeting. All efforts to compromise the difficulty were futile. A caucus of Republican Senators was held on the 9th of May, in which Senator Conkling stated his claims at great length, and charged the President with bad faith and violation of his pledges. The caucus continued its discussions on the 10th, when Senator Edmunds withdrew a resolution which he had offered the day before, in favor of postponing action on Robertson's case until December. The caucus made no decision at that time on the course to be adopted, and another was held on the 13th, with a like result. Meantime a contest had been carried on in the Senate over the appointment of Stanley Matthews, of Ohio, to be an Associate Justice of the Supreme Court. It was confirmed on the 12th by a majority of one vote.

It having become evident that no action could be secured on the part of the Republican

Senators, hostile to the confirmation of Judge Robertson's appointment as Collector, on the 16th of May both the New York Senators, Roscoe Conkling and Thomas C. Platt, sent notice to the Vice-President that they had that day forwarded the resignation of their seats to the Governor of their State. Their reasons for adopting this course were set forth in a joint letter of resignation addressed to Governor Cornell. (See New York.) The appointments of Mr. Robertson as Collector of the Port of New York and of Mr. Merritt as Consul-General at London were confirmed, almost without opposition, on the 18th of May. The name of General Badeau for *Chargé d'Affaires* to Denmark was withdrawn at his own request. Among the other appointments confirmed the same day were those of Thomas A. Osborn as Minister to Brazil, in place of H. W. Hilliard recalled; and Judson Kilpatrick as Minister to Chili, in place of Mr. Osborn. On the following day the nominations for offices in the State of New York, which had been withdrawn, were renewed, but the name of Henry E. Knox was substituted for that of Louis F. Payn as Marshal of the Southern District, and that of Charles A. Gould for that of John Tyler as Collector of Customs at Buffalo. An appointment to which much opposition was developed was that of William E. Chandler, of New Hampshire, to be Solicitor-General. The vote in the Judiciary Committee was a tie, two members being absent who were opposed to confirmation. The name was reported without recommendation, and, on the 20th of May, was rejected by a majority of five in the executive session. The same day the New York appointments and some others were confirmed, and the Senate adjourned without any renewal of the contest over the election of officers.

SECOND SPECIAL SESSION OF THE SENATE.

On the 23d of September, President Garfield having died in the mean time, President Arthur, his successor, issued a proclamation convening the Senate in extraordinary session on the 10th of October following. The main object of this was understood to be the election of a President of that body, as the accession of the Vice-President to the executive chair left no officer in the line of succession, in case of the death, resignation, removal, or disability of the incumbent. Before the Senate met there was some controversy as to whether the presiding officer should be chosen before the new Senators were admitted. The resignation of Messrs. Conkling and Platt, and the death of Senator Burnside, of Rhode Island, had produced three vacancies on the Republican side, giving the Democrats control of the organization, if it was to be effected before their successors were sworn in. Both parties held caucuses on the 8th of October. The Republicans questioned the right of the Democrats to elect a presiding officer before the new Senators were sworn, but resolved to confine their opposition to a formal protest.

They appointed a committee to confer on the subject with a similar committee on the part of the Democratic Senators. Before receiving information of this action, the Democrats had decided that the Chief Clerk should call the Senate to order, and that the resolution for the election of a President *pro tem.* would then be in order and should be offered. They selected Mr. Bayard, of Delaware, as their candidate. They consented to the appointment of a committee of conference, but there was no agreement reached, as neither party was disposed to recede from its position. The Republican candidate for the temporary presidency was Mr. Anthony, of Rhode Island.

After the preliminaries of opening the session on the 10th had been disposed of, Mr. Pendleton offered a resolution that Mr. Bayard, of Delaware, "is hereby chosen President *pro tem.* of the Senate." Mr. Edmunds arose and presented the credentials of Messrs. Miller and Lapham, of New York, and Aldrich, of Rhode Island, and moved that they be first sworn by Mr. Anthony, the oldest member of the session in continuous service. He claimed that this was in accordance with right and with precedent. It was claimed on the other side that the law requiring new Senators to be sworn in by the presiding officer could not be set aside unless by unanimous consent. A motion to lay Mr. Edmunds's proposition on the table was adopted by a vote of 36 to 34. General Mahone was absent, and Judge Davis voted in the negative with the Republicans. Mr. Edmunds then moved to amend Mr. Pendleton's resolution, by providing that Mr. Bayard be chosen President *pro tem.* "for to-day." This was negatived by a party vote, Davis, of Illinois, still acting with the Republicans. Then Mr. Edmunds moved to substitute the name of Mr. Anthony for that of Mr. Bayard, which was also negatived. The original resolution of Mr. Pendleton was adopted, 34 to 32, Mr. Davis not voting. The Democrats in caucus, the same day, determined to make no opposition to the admission of the new Senators, and not to press the election of a Secretary at present. They selected Colonel L. Q. Washington, however, as their candidate for that position. The new Senators were sworn on the 11th, without objection. The equal division of parties in the Senate, there being no longer a casting vote of the Vice-President, made the retention of Mr. Bayard as the presiding officer dependent on the vote of Senator Davis, in case the Republicans attempted to secure a change. The Republicans held a caucus on the 12th, and determined to propose Mr. Davis himself as the President *pro tem.* The next day a resolution continuing the standing committees was adopted by a vote of 37 to 35, and then a resolution was offered by Mr. Logan, of Illinois, for the election of his colleague, Senator Davis, as the presiding officer. This was adopted, yeas 36, nays 34, Bayard and Davis not voting. Messrs. Bayard and Anthony were appointed to escort

Mr. Davis to the chair. In accepting the position, he declared that he could not have done so if the manner in which he was chosen had not left him free from party obligations. He accepted the honor as a recognition of the independent position he had long occupied in the politics of the country.

The session, which was interrupted for a few days by the centennial celebration of the battle of Yorktown, came to an end on the 25th of October, having been devoted exclusively to executive business. Among the important nominations confirmed, was that of Charles J. Folger, of New York, for Secretary of the Treasury, Mr. Windom having insisted on resigning, and ex-Governor E. D. Morgan, of New York, having declined the position after his appointment had been made and confirmed. A contest was begun over the appointment of a postmaster at Lynchburg, Virginia, at the instance and in the supposed interest of General Mahone, but as it threatened to prolong the session it was dropped without action. The appointment was opposed by the Democrats, on the ground that it was intended to have an influence in the political canvass then pending in Virginia. An unwonted incident of this contest was a resolution adopted during an all-night sitting, directing the Sergeant-at-Arms to compel the attendance of certain absent members, in order to produce a quorum. The execution of this order led to a vigorous protest, signed by several Senators, which was entered on the journal.

CONNECTICUT. The members-elect of the Connecticut Legislature met at the Capitol and were organized for the session of 1881 on January 5th. Lyman W. Coe was elected President *pro tempore* of the Senate, and William O. Case Speaker of the House of Representatives; both were Republicans, and both elected by great majorities on a party vote.

On January 5th, also, the new Governor, Hobart B. Bigelow, was inaugurated. His message to the Legislature upon the condition of public affairs in the Commonwealth he sent in at once to the two Houses.

The constitutional amendment changing the manner of appointing the judges of the Supreme and Superior Courts, which was passed at the last session and submitted to the people for sanction or rejection at the town elections on October 5th, was ratified by their vote, and "thus became a part of the State Constitution."

The sanitary condition of the people of the State, owing apparently to want of caution and other causes, suffered in 1880; although there have been no serious epidemics, the general average of health has not been so good as during the two years preceding. The sanitary conditions of life, however, as regards drainage, ventilation, and water-supply, are receiving constantly increased attention.

The affairs of the Commonwealth are in a satisfactory state, and there is every sign of a healthy and progressing commercial condition.

With regard to manufacturing industries, which are of comparatively vast magnitude in Connecticut, and other matters relating to which directly or indirectly the General Assembly would be called upon to legislate, the Governor in his message deprecated the enactment of any law that might, even remotely, tend to affect them injuriously, saying: "In every county are flourishing towns and villages which have sprung up, each about some thrifty manufacturing establishment. These establishments now number nearly twenty-two hundred, employing, and as a rule profitably employing, over \$60,000,000 of capital, and giving work to upward of sixty-six thousand persons. The value of their annual product is reckoned at \$120,000,000, and their market is the world. Interests so important, and affecting such large classes of our people, should be sedulously protected from any legislation that would embarrass or contract the energy of invention or of capital. Every enactment which could possibly affect them should be carefully scrutinized, to the end that it works no injury."

The finances continue in a satisfactory condition. The conservative method which has been steadily used heretofore is still continued. During the year ended November 30, 1880, the aggregate receipts of the State from all sources, including \$42,146.95 brought over as cash balance from the previous year, were \$2,506,971.18; the aggregate expenditures for all purposes (including \$286,197 interest paid on the State debt) were \$1,600,383.36; leaving in the Treasury, on December 1st, an available surplus of \$906,587.82 to meet current expenses of the year 1881.

The amount drawn from the Treasury on account of the new State House in 1880 was \$118,131.36. This sum includes the \$15,000 appropriated by the last General Assembly as a compensation to the members of the Capitol Commission, who had in charge the building while in course of erection.

The receipts for the year ending November 30, 1881, including the above-noted balance of \$906,587.82, were estimated at \$2,501,461.82; and the expenditures at \$1,459,005.32.

The State debt continues to be as it was at the end of 1879—\$4,967,600. Nearly three fourths of this sum bears interest at the rate of 6 per cent per annum; the remainder at 5 per centum.

Outstanding bonds to the amount of \$887,000 will become due on January 1, 1883, the State having it then in her power either to pay and cancel them, or to continue them, in whole or in part, by a new issue.

The total valuation of taxable property in Connecticut the grand list shows to be \$327,182,435, an increase of \$2,293,412 over the preceding year.

The number of savings banks in the State continues the same—85; but the number of depositors has grown up to 231,913, which is 9,692 greater than it was at the close of the

previous year. Of this increase, 9,408 are depositors of less than \$500. These depositors, compared with the whole population of the State, are in the proportion of more than one in every three of her inhabitants. The present amount of all their deposits is \$76,518,570.91, an increase of \$3,676,127.52 over that of the year last past. The average amount for each depositor is \$357.50, and for every inhabitant in the State it is above \$100. The dividends annually paid by the banks have been withdrawn by depositors to a much less extent this year than in the preceding.

The 28th annual report of the Railroad Commissioners shows the railways operating in Connecticut to have had a prosperous year in 1880, their business having considerably increased in freight as well as passenger transportation. The total of their gross earnings amounted to \$12,290,878.51, which is \$1,378,627.34, or 12½ per cent, above that of 1879. They exceed the gross earnings of all previous years—even of 1873, when the earnings were the largest as compared with those of any preceding or succeeding year till 1880. A noteworthy fact in the mutual relations between the yearly amounts of earnings from passenger and freight transportation in these roads for 1880 was, that the freight earnings, instead of being less than the passenger, as they had always been, exceeded them by more than one million dollars. This change has occurred especially in the business of two among the roads, namely: The New York, New Haven, and Hartford, and the New York and New England. The proportion of expenses to earnings was 62 per cent, a little more than 1 per cent over the previous year's.

Nine companies have paid in dividends last year \$2,539,295.70, or nearly as much as they had paid in 1879.

The aggregate length of all the railway lines in Connecticut measures 953.96 miles; double tracks, 108.78 miles; sidings, 185.94 miles—making a total of 1,248.68 miles of single track.

The collective amount of State tax paid by the roads into the Treasury during the year was \$357,000. In 1879 it was \$346,000.

The education of youth continues satisfactory, with a fair prospect of forward progress in efficiency and thoroughness. The cost to the State for supporting the common schools in 1880 was \$213,420.50, the largest amount among the items of public expenditure after that belonging to the judiciary system, which was \$256,598.93. The results of this large expenditure have for many years been most gratifying; and the reports of the State Board of Education, and of their Secretary, show the combined efficiency and thoroughness of the system of free popular education. The "Compulsory Law," so called, by which children of proper age are made to attend the public schools, has been more efficiently and perfectly enforced this year than ever before. This law seems to be of comparatively easy execu-

tion in Connecticut, meeting with no such marked opposition or complaint, on the part of parents, as experience shows to have been the case in some other States. For this difference between the States concerned, Governor Bigelow accounts as follows: "This shows not only the temper of our people toward education, but also that there does not exist with us that necessity for the earnings of children of school age which supports the defiance of similar laws in other communities."

For the support of the State Normal School, where teachers are trained to give instruction in the common schools, the amount paid from the Treasury in 1880 was \$12,700. A good increase in the number of trained teachers is now promised by the building of a Normal School in New Britain, for the erection of which the General Assembly appropriated \$75,000, the said town having pledged itself to contribute \$25,000 more, of its own money, for the same purpose.

In the Hospital for the Insane, at Middletown, there were 610 patients at the beginning of last year, and 528 at the end of it. The whole number of patients treated during the year was 654, which shows a permanent overcrowding in the hospital, the capacity of which is sufficient to give accommodations for 450 patients only. The additional new buildings, for which the General Assembly at the previous session appropriated a large sum of money, and which, when completed, will probably double the present capacity of the hospital, have been already planned, and their erection has begun. Of the 528 patients remaining in this institution at the close of 1880, two only were paying patients; the Governor stating "that 526 were entirely supported by the State, or by the towns from which they were sent."

The School for Imbeciles, at Lakeville, seems worthy of continuance for its usefulness. The pupils cared for in it during the year numbered 93, of whom 47 were beneficiaries of the State. The total expenditure of the institution for the year amounted to \$15,799.91, of which \$5,960.87 were paid from the public Treasury for the 47 State beneficiaries, and the remainder was paid by the friends of the other pupils. A department connected with this school takes care of several harmless lunatics, some among whom also were supported last year by the State at a cost of \$534.

In the State Reform School for Boys there were, at the close of 1880, 307 inmates; received during the year, 148; discharged, 109. This school is considered to have never been in a better condition than at present. The family system, so called, has been successfully introduced in its management since last year.

The Industrial School for Girls, at Middletown, during the year 1880, received 71 girls; placed in positions of usefulness, or discharged, 63; remaining in the school on December 1st, 160. The whole number of inmates at this

school in the 11 years of its existence is reckoned at 430. Of the girls sent out from it, three fourths are stated to have given evidence of permanent reformation. An additional building is now in process of erection for the older inmates.

In the State Prison there were 261 convicts in confinement on December 1, 1880. At the same date in 1879 they numbered 251; committed during the year, 134; released, 124. Eight among the prisoners were sent from the Penitentiary to the Hospital for the Insane. The prison's management has been for some time progressing from good to better, especially in regard to discipline among the convicts.

The militia of Connecticut, under the name of "National Guard," consists of 2,731 enlisted men and 183 commissioned officers, making a total of 2,914 as the active military force of the State. Last year's expenditures for this force amounted to \$83,609.67. There are also some independent companies, and the Governor's Guard; for both of which a further sum of \$15,021.28 was expended, the aggregate military expenses for the year having been \$103,630.75.

The First Regiment of the Connecticut National Guard, under the lead of its colonel, and the second company of the Governor's Foot Guard, with a military band attached, were detailed to take part at the celebration of the centennial anniversary of the surrender of the English army at Yorktown, Virginia, on October 19th. The Governor himself, accompanied by his staff and the principal military and civic officers of the State, besides other prominent men of Connecticut, attended the ceremonies of the occasion. The Legislature appropriated \$7,000 to meet the expenses of the excursion.

The Legislature was urged to reapportion the senatorial districts of the State without further delay, if the people of Connecticut are to live under what is more than a semblance of a representative form of government. The argument presented to the Legislature was as follows: These districts remain now the same as they were when first formed fifty years ago, although the changes in their respective populations during the lapse of this half century have been so numerous, and so remarkably great, as to render the continuance of the old districts not only unjust, but manifestly contrary to the intention expressed and embodied in their original formation. Among the reasons set forth to evince the imperative necessity of a new apportionment, and some practical instances showing the injustice of the division then existing, were the following: "In the plan of government designed by the Constitution the Senate was intended to be the body of popular representation. The lower and larger House was, for historical reasons, founded upon the existence of townships. It was provided that the basis of representation in the Senate should be adjusted from time to time, as the population of the State changed,

the times for such adjustment being made to correspond with those times when a new census should be taken. Fifty years ago the first apportionment was made under this arrangement, but, notwithstanding the very greatest changes have since taken place, not only in the aggregate population of the State, but especially in the distribution of that population, no Legislature has, at any of the decennial periods intervening, seen fit to change the basis of representation. . . .

"The population of the State by the census of 1880 is 622,683, as against 287,675 in 1830, the census on which the present apportionment is based. . . . The whole character of the population, and of the occupations in which they are engaged, has during this time undergone an entire revolution. Consequently, the centers of population have shifted, and the density of population has altogether changed. Districts which were substantially equal fifty years ago, to-day show a difference of 4 to 1; others have grown so as to present differences of a less degree, yet quite enough to make equality of representation absurd. Six districts, with a combined population of 83,000, balance in the present Senate six other districts having a population of 281,800; while ten districts with a population of 411,700 can be outvoted by eleven districts which have a population of 199,000."

The Legislature subsequently passed an act reapportioning these senatorial districts, and defining their respective limits. The provisions of this act have also been carried into practical execution, the districts numbering now twenty-four, instead of twenty-one, as heretofore. The Democratic papers in the State denounce the manner and character of the new apportionment in the strongest terms, noting it "as the most glaringly dishonest partisan work ever attempted in the United States"; and to make this partisan injustice more clearly apparent, they have published a map of Connecticut representing the dividing lines as well as the different configurations and sizes of the several districts. The Republican papers seem to admit that by the new arrangement of the districts their party secures seventeen, and may possibly get two or three more, out of the twenty-four Senators. The relative populations of the new districts vary from 12,093—the least in the twenty-third—to 62,882—the largest in the eighth. Ten among the districts have populations ranging between twenty and thirty thousand.

The January session of the Connecticut Legislature in 1881 was closed in its fifty-second day, April 14th, when the Governor adjourned the General Assembly *sine die* with the usual formalities. Among the more important acts passed at this session are the following: A new law relating to elections; it is intended for the principal cities in the State, to prevent fraudulent registration. An act reducing the tax on mutual life insurance companies; this

reduction is estimated to diminish the annual State revenue by nearly one hundred thousand dollars. An act had also been passed by both Houses reducing the State tax in general, but it was subsequently rescinded. An act empowering the Railroad Commissioners to regulate the practice of the steam-whistle, so called, with a view to its abatement. An act ordering fire-escapes to be made in all buildings where twelve or more persons are employed for work in one room. An act raising the jurisdiction of the Hartford and Fairfield courts, in civil cases, to one thousand dollars; and the judges' salaries to three thousand a year.

The collective sums appropriated to public institutions by the Connecticut Legislature of 1881 amount to nearly a quarter of a million. Among them, besides the \$75,000 before mentioned for a normal school at New Britain, are \$50,000 for a hospital at Bridgeport, \$12,000 to the Reform School for Boys, and \$10,000 to the Industrial School for Girls.

In the early part of the session, January 18th, the two Houses separately voted for the election of a United States Senator from Connecticut, to occupy the seat of William W. Eaton, whose term was to expire on March 3d; the candidates in competition for that office being Joseph R. Hawley, the Republican nominee, and Mr. Eaton himself, renomiated by the Democratic members of the General Assembly. The voting in either House resulted as follows: In the Senate—Hawley 16, Eaton 4, one of the Democratic Senators having been absent; in the House of Representatives—Hawley 161, Eaton 68. Joseph R. Hawley was elected.

At the election for members of the Legislature in November the Republican candidates were returned in far greater numbers than the Democratic. The Senate consisted of 24 members—Republicans 17, Democrats 7; the Lower House of 247 members—Republicans 148, Democrats 99. By these results the Republican majorities, as compared with those of 1880, are reduced—in the Senate from 11 to 10; in the Lower House from 84 to 49; and on joint ballot from 95 to 59.

COSTA RICA (REPÚBLICA DE COSTA RICA). Detailed statements concerning area, territorial division, population, etc., may be found in the "Annual Cyclopædia" for 1877.

The President of the Republic is General Tomás Guardia; the Vice-President is General Pedro Quiroz; and the Cabinet was composed of the following ministers: Interior, Señor S. Lizano; Foreign Affairs, Justice, Public Instruction, and the Poor-Commission, Dr. José María Castro; Finance and Commerce, Señor Salvador Lara; Public Works, Licentiate M. Arguello; and War and Marine, General V. Guardia.

The Bishop of San José is the Rt. Rev. Bernardo A. Thiel.

The Costarican Minister Resident in the United States is Señor Peralta; and the Con-

sul-General of Costa Rica at New York is Señor José Muñoz.

The United States Minister (resident in Guatemala, and accredited to the five Central-American republics—Guatemala, Honduras, Nicaragua, Salvador, and Costa Rica) is Dr. Cornelius A. Logan; and the United States Consul at San José, Mr. A. Morrell. The transfer of Consul-General Hall from Havana to Central America, as Minister Plenipotentiary from the United States, has been spoken of.

In the absence of later official returns relating to finance, commerce, etc., than those given in our volume for 1880, the following extract from a letter addressed by a Costarican bondholder to a London journal, in August, 1881, will be found interesting, as it contains a summary of financial, agricultural, and railway matters for that year:

Under the heading of "Trade and Finance," in your last issue, a paragraph is assigned to the President and the railway of Costa Rica, and, while you refer to rumors that the former is endeavoring to raise money irrespective of the bondholders, you justly add that the latter is distinctly pledged to them. Regarding the railway, therefore, as the property of the holders of the loan, it might be well briefly to examine into the value of that property, should they be able to get it into their own hands. From Port Limón on the Atlantic, seventy miles of narrow-gauge line have been constructed, and now reach the Río Suño. From this point to the capital, San José, twenty-six miles have still to be made, and of these eighteen are over uneven and difficult ground. Up to the present time \$17,000,000 have been expended on the railway, and it is estimated that \$2,000,000 more will be required to complete it, so that the total cost will amount to \$19,000,000. The commerce and agriculture of the whole republic are confined to four provinces, those of San José, Cartago, Heredia, and Alajuela, which together cover an area of only eight square leagues. They have no means of exporting their produce, or of introducing imports, except through Punta Arenas, on the Pacific coast; and the cost of carriage to and from that point, ranging from a minimum of \$20 per ton to a maximum of \$40, according to the season, sometimes exceeds the whole freight by sea to Europe, even by the expensive route of Panama. The imports and exports make together a very considerable tonnage, which, if brought over the line when completed, would form an item of importance in the traffic returns. From Europe the imports consist of cloths, iron, provisions, machinery, etc., and amount to 20,000 tons per annum; and from the United States 2,500 tons of corn, etc., are annually introduced. The coffee exported reaches 10,000 tons, and leather and other items 1,000. Consequently we have a grand total of imports and exports amounting to 33,500 tons, all of which will have to pass over the whole length of line, to or from the consuming and producing provinces already mentioned. The cost of freight per ton, *via* Cape Horn from Europe to San José, including the land-passage from Punta Arenas, is at least £7 (\$35), and *via* Panama £10 (\$50); consequently, considering the time that is lost by the former route, and the double transshipment by the latter, a charge of £8 10s. (\$42.50) per ton from San José to Europe *via* Port Limón would be extremely reasonable to the producer and consumer, and, allowing 30s. (\$7.50) per ton for the Atlantic voyage, we have £7 (\$35) per ton for railway freight from San José to Port Limón. At this rate the line would give upward of 5½ per cent on the whole capital, and I have not taken into account the enormous timber-trade that must be opened up as soon as there is any possibility of bringing it to the sea-shore, nor have I made any allowance for any passenger traffic and other

items, as against any results from these sources I should have to put the expenses of maintenance. These brief details may, however, serve to show my fellow bondholders that, in the railway of Costa Rica, there is a basis on which to found some hope for improvement in the value of the bonds they hold; and, as I am informed that President Guardia will be in London in the course of a few days, and that he holds full powers not only to negotiate, but to accept an arrangement, subject only to the confirmation of Congress, I am strongly of opinion that the bondholders should not lose the present opportunity, but should at once take energetic action. I do not fear that any negotiation can be concluded irrespective of the bondholders, for in Paris and Amsterdam there are also many persons who have invested in the loans, and who would not permit any new advances to the Government of Costa Rica unless their prior claims were recognized.

In the article **COLOMBIA**, in the present volume, will be found mention of a treaty between that republic and Costa Rica, to procure European arbitration upon the question of the ownership of the disputed territory on the isthmus.

COTTON. The extraordinary increase which has taken place in the yield of cotton in the United States (see statistics in **COMMERCE AND FINANCE, AMERICAN, IN 1881**) is insignificant in comparison to the capabilities of the country for expanding the production of this staple. The United States produces now just about four fifths of the cotton grown in the world, and the product of the other countries, notably of India and Egypt, the largest producers, is rather diminishing than increasing at present. For the last six years the average cotton crop has been 5,000,000 bales; in 1880-'81 it exceeded 6,500,000 bales. Yet, out of every hundred acres capable of producing cotton not more than two or three have been under cultivation; and the yield per acre is not half as great in quantity, and very much inferior in quality, to what it might be made. In 1879-'80 the cotton acreage was 14,441,993 acres; the yield was 5,737,257 bales, or an average of four bales of 475 pounds to ten acres. Under careful cultivation a bale an acre is commonly obtained, and two bales are often grown. The fertile Yazoo bottom in Mississippi yields, with the present imperfect cultivation and incomplete picking, three bales to every four acres. There are 3,000,000 acres of land in the same district which could be reclaimed by simply excluding the Mississippi overflows. This would increase the product of the Yazoo flats to 2,250,000 bales, which might be more than doubled by improved cultivation, and the State of Mississippi could produce on this tract and on the uplands as much as the entire crop of the United States. Texas is capable, when its entire cotton area is utilized to the best advantage, of producing ten times the present crop of the whole country.

A slight lowering of the cost has always the effect of increasing the consumptive demand for this universally desired commodity in an extraordinary degree. The consumptive ca-

capacity of the world could at a reasonable calculation be many times multiplied through the economies in production which can be obtained from improved methods and appliances that are already known. As a means of calling the attention of cotton-growers to improved methods in the cultivation and handling of cotton, Edward Atkinson, a statistician and expert associated with manufacturing industries in New England, suggested, through the medium of the press in 1880, the plan of holding a special Cotton Exhibition, in which all the products and materials of the cotton industry, and all the mechanical appliances employed from the planting of the seed to the turning out of the finished web at the mill, could be inspected and compared. Atkinson had primarily in mind the demonstration to the Southern growers of the advantage of more thoroughly cleaning the raw fiber before packing it for sale to the manufacturers and exporters, and proposed that the exhibition should be held in Atlanta in 1881. The business men of Georgia and other Southern States caught at the suggestion, wishing to show the advantages of the South as a cotton-manufacturing locality, which had been proved by the success of recently established factories, and to attract the attention of capitalists to the manifold other industrial capabilities of their section. (See **EXPOSITION** at Atlanta.)

The need of some efficient mechanical device for the rapid gathering of cotton is urgently felt. The crop is nearly every year in danger, and frequently seriously damaged, while there is a constant waste of enormous aggregate amount, through lack of good harvesting machinery. The various cotton-pickers which have been invented may none of them be superior to hand-picking, since none has yet supplanted the primitive method. For the assistance of the laborer in sustaining the awkward position while picking, a pair of staves, fastened to the legs and holding a belt under the body, is a patented device which is sometimes used. A mechanical hand-picker has been invented, consisting of a rotating spindle which is kept moist, and winds the lint out of the boll, the spindle being turned by means of a crank. Another device is an endless toothed chain, driven by a sprocket-wheel and crank, with an appliance for stripping the cotton off the bolls into a basket. A simple hand-picker which has been lately patented consists of gloves with wire hooks, worn on both hands, and a brush at the waist to rub off the cotton into a bag below. An older and more complex device is a reciprocating tongue provided with bolls which detaches the cotton from the boll, the agitation of the tongue moving the cotton gradually up through an oblong box by the aid of an elastic plate provided with spines, depositing it at the end in a bag. A pneumatic tube connected with an exhaust pump or fan has been tried, the hose being applied to the bolls by hand. An electric cotton-picker was

patented in 1870: two endless rubber belts, electrically excited by friction, move vertically upward on each side of the row, and as the machine is driven along, the plants are violently agitated by mechanical means; the cotton which is shaken from the bolls adheres to the rubber bands, and is conveyed to a receptacle at the top of the machine. A pneumatic picker working automatically contains a horizontal fan which is actuated by the wheels on which the machine is drawn, the cotton being disengaged by a series of curved hoops inclosed within a hood and conveyed by the current of air into a wire-cloth receiver where the air finds exit. The stalks of the cotton-plant are cut, and the cotton beaten out into a wagon-box upon a grating of transverse wires, according to the method of a Louisiana inventor. An elaborate picker, patented in 1872, is a long cylinder covered with bristles, which revolves by the aid of one of the supporting wheels, and extracts the ripe cotton from the bolls, which are bent over to the brush by a reel in front; a cleaning cylinder removes the lint from the bristles and deposits it in the receptacle behind. A similar method has been recently patented, in which vertically revolving brushes, in contact with cleaning-combs, are arranged in two pairs, one pair of brushes working on each side of the cotton-row. Another mechanical harvester contains a series of barbed flexible rods which work up and down alternately among the cotton-plants, each in its ascent stripping the cotton from the descending ones, which is taken from the tops of the vibrating arms by endless bands.

The prevention of the ravages of the cotton-worm has never been attempted with any success until within the last ten years. Statistical inquiries show that the annual loss to the country from this pest between the years 1865 and 1879 has been \$15,000,000, while in some years it has amounted to double that sum. The natural history of the cotton-worm was explained at the Atlanta Exhibition by Professor C. V. Riley. The worm feeds on the under side of the leaves, and is seldom observed in the earlier part of the season, though its presence is detected by skilled eyes from yellowish and semi-transparent blotches on the leaves. It makes its chrysalis usually in a piece of rolled-up leaf. The moth, which is nocturnal in its habits, deposits its eggs on the under side of the lowest and largest leaves. The eggs are .6 millimetre wide, and are not easily detected, being of nearly the color of the leaf. The period of the phases of a generation varies according to temperature. The average time, taking the whole season together, is about one month. There are thus seven or more generations developed each season in the Gulf district. The first worms appear in the southern portion of the cotton belt between the middle of April and the middle of May. The cotton-worm is exceedingly prolific, the moth being capable of laying 600 or 700 eggs. The

worm is not present in destructive numbers before the third generation. The notion that it suddenly appears in midsummer is therefore natural. The insect hibernates only in the southern part of the cotton-region, and its extension north must proceed every season from thence. Staining and fragments of leaf in the cotton, impurities the most difficult to remove, are caused by the gnawing of the cotton-worm.

The first effectual method of destroying the cotton-worm was recommended by Professor Riley, Entomologist to the Department of Agriculture at Washington, in 1873. This was the use of Paris-green. Appliances for the application of this and similar arsenical preparations were introduced in great variety between 1875 and 1878. They all had for their object the throwing of the poisons, finely divided in solutions or powders, over the plants broadcast. The subject of the prevention of the cotton-worm's depredations was made, in 1878, the subject of a special investigation by the Agricultural Bureau. The method of spreading the poison from below was found preferable. The dry powder is more efficacious in wet weather, but the wet method is ordinarily more expeditious and less dangerous. The cost of appliances for the wet method is greater. The punctured sprinklers and gauze sifters have been abandoned, as no means could be devised for keeping them from clogging. Slit-nozzle sprinklers, which project the fluid in a fan-like sheet, that breaks up into a spray, are made with the fissures cut in different curves and angles to produce different kinds of jets. These are excellent where large sprays for broadcast sprinkling are desired. For obtaining small sprays for poisoning cotton from beneath, a form of nozzle has been devised in which the fluid is let into the nozzle-chamber at a tangent, causing a rapid whirling of the fluid against the inner surface and its slit; this washes away the particles which would otherwise accumulate and clog up the passage. Lip-nozzles spread the fluid in a shower by dashing the stream against an inclined surface. These may produce a jet in one sheet, or reflected in two or more planes, or spreading in a funnel-shaped spray. Rotary nozzles revolve by the force of the jet, causing a spiral movement of the fluid, which breaks it up into a spray. Rifling of a tubular nozzle produces the same effect. A form of rotary sprinkler, called the cyclone nozzle, is well adapted for under-sprinkling, as it produces the finest kind of spray; the round-nozzle chamber has a tangential inlet, and, at right angles to this, a central circular outlet.

There are four classes of machines for spreading poison—brush-throwers, rotary fan blowers, bellows-blowers, and squirting-machines. The latter is the most valuable form. Force-pumps have been tried, but they have been found too expensive for ordinary use. A device, called the automatic sprinkler, does away with the necessity of pumps. The barrel of

poison is elevated very high in the air, and the dust is released in such a manner as to spread it in an even shower. Gas-pressure has been successfully used to distribute poison. One of the best machines forces the liquid through a system of branching tubes ending in a trailing flexible fork which sprinkles two rows from underneath. With \$10 or \$15 outlay for machinery, and less than five cents per acre for material, and with the labor of one man and a team, 150 acres of cotton can be effectually poisoned in one day.

The only vegetable poison which has proved a protection against the cotton-worm is pyrethrum. The cultivation of the plants that furnish this powder, which is so remarkably deadly to insects without being harmful to other life, the Department of Agriculture is seeking to introduce in the United States.

The business-men of the South look forward with confidence to a rapid development of cotton manufacture in the Southern States, and the transfer to that section of the business of New England and of Great Britain to a considerable extent. Water-power is found in ample quantities throughout large portions of the cotton-region. The grounds on which they base their belief that cotton-milling will grow in their section, at the expense of the present great centers of the industry, where the investment of vast amounts of capital has apparently fixed it for ever, are that the entire cost of packing and of transport can be saved and added to the profits of the Southern manufacturer. The cotton is also said to be better and more easily worked before being compressed in bales; and the climate of the South, as compared with that of the Northern States, is said to be more favorable to the manufacture, which requires no artificial moisture, and is, hence, more healthful for the operatives. The difference in the cost of material to the Southern and the Northern manufacturer is estimated as follows on each bale: bagging and ties, \$1; ginning and baling, \$3; storage and insurance, 75 cents; drayage, 20 cents; sampling of two pounds, 20 cents; compressing, 75 cents; commissions and brokerage, \$2; freight to New England, and insurance,

\$5; loss by stealing, dirt, storms, careless handling, etc., \$3—in all, \$14.90. This is equivalent to 1½ cent a pound. The charges for baling, transportation, and the services of middle-men, paid by Northern and British manufacturers on their takings from the crop of 1879, amounted to not less than \$100,000,000, or 40 per cent of the total receipts of the planters for the crop.

The average cost of water-power in the Southern States is \$6 per horse-power per annum; while the steam-power used in some of the large New England mills costs \$12. The Southern streams never freeze, and are seldom affected by drought to any material extent. The humidity of the Southern climate is almost constant, and the hygrometric condition most favorable to cotton manufacture prevails winter and summer, the range rarely passing the limits of 65° and 70°.

CYPRUS. This island, in respect to size, occupies the third rank among her Mediterranean sisters, and comes after Sicily and Sardinia. Its length is about 140 miles; its total surface is estimated at 4,000 square miles. It is crossed, lengthwise, by two chains of mountains: the northern one follows the sea-shore, fronting Caramania (the old Cilicia); the other includes, in the north, the group of Olympus or Troodos Mountains (6,621 feet of elevation). Two plains, Morpha and Messaria, extend between those two chains; the latter, watered by the Pidas, is very fertile. In the beginning of the Christian era the population of the island amounted to 1,000,000 inhabitants. This number is now considerably reduced; and, although, for want of a correct census, exactness is out of the question, yet it is deemed quite safe to affirm that it does not exceed 170,000 inhabitants, viz.:

Greeks.....	111,930
Mussulmans.....	55,000
Maronites.....	1,600
Armenians.....	300
Catholics.....	1,200
Total.....	170,000

The principal cities are Lefkosia, 20,000 inhabitants; Larnaka, 9,000; Limasol, 7,000; and Famagusta, 6,000.

D

DAKOTA. The area of this Territory, according to the latest estimate of the United States Government officials, is 150,932 square miles. The previous estimate was 148,932 square miles. The population of the Territory was 4,837 in 1860, and 14,181 in 1870. By the census of 1880 it is 135,180.

The Territory lies north of Nebraska and west of Minnesota and Iowa. It was organized in 1861, and the first Legislature was convened in 1862. It is divided into ninety-five counties, of which only a part are organized.

The capital of the Territory is Yankton, and the Governor is Nehemiah G. Ordway. The delegate in the United States Congress is Richard F. Pettigrew, a Republican. At his election the vote was: Pettigrew, 18,909; McCormick, Democrat, 9,182.

The state of agriculture in some of the counties shows a very rapid improvement. In Cass County is the famous Red River. The population is about 12,000, and nearly all the land of the county has been taken up. It is sold at from five to fifteen dollars per acre. About

120,000 acres were under cultivation in 1881, of which 100,000 contained wheat. In the next year it was expected that the wheat-land would increase to 150,000 acres and the crop to 3,000,000 bushels.

The county north of Cass is Traill, and the county south Richland. Traill County has a population of 6,000 and Richland 3,300. A large quantity of railroad and Government land is in these counties and yet remains unsettled. It is good farming land, and for sale cheap. Goose Creek, Elm, Rush, Maple, Cheyenne, and Wild Rivers flow through this county, and it also has Red River on the east. The Cheyenne is the largest, and empties into Red River. It is one hundred and seventy-five miles long, and flows east for one hundred miles through a good country. Devil's Lake also empties a large body of water into the Cheyenne, which then flows southward ninety-six miles, cutting Barnes County in halves. The valley of the Cheyenne is narrow and picturesque, and very fertile. Its water-powers are unsurpassed.

Barnes County is less than five years old, but it already has a population of 3,000 inhabitants. In 1877, 3,000 acres were cultivated; in 1879, 27,000; and in 1880, 40,000. The land is good and very cheap. It is rolling prairie, the undulations at times rising into hills. This county is well timbered with oak, elm, and ash. Along the rivers are fine meadows, and the soil of the uplands is composed of black loam. North of Barnes County is Foster County, and on the south Ransom County. These are represented as being good counties. Near the center of Barnes lies the shire-town, Valley City, in the Cheyenne Valley. It is a pretty town, and is surrounded by a lovely and fertile country. The river flows by the town, and its banks are covered with a growth of oaks, elms, cherry, and box-elder trees. The town already has several hundred inhabitants, although it was only commenced in 1878. There are twenty-five business firms, mills, school-houses, hotels, a bank, and one fine brick block. There are quite a number of handsome private residences, and altogether the town may be said to have a promising future before it.

Adjoining Barnes is Stutsman County. This county has 1,300,000 acres of good land, consisting of prairie, meadow, and bottom lands. The land is subject to entry by pre-emption, as tree-claims and homesteads.

The James River divides Stutsman in twain, and with its tributaries waters the county amply. The James is a noble stream, flows through five hundred and twenty-five miles of country, and is estimated to be one thousand miles long. A steamer has been placed on it, and a company organized for its improvement and navigation. James Town is the county-seat of Stutsman, and is located on the James River, at a beautiful spot where the valley widens, and is surrounded by fertile knolls rising in terraces. The town has obtained a

fine start; has a bank, hotels, handsome court-house, and many neat and attractive dwellings. Stutsman is one of the best grazing counties in Dakota, and cattle and sheep raising are carried on as one of its regular businesses. The railroad lands are sold at from \$2.50 to \$5 per acre.

Kidder County is west of Stutsman, and contains 900,000 acres of land, most of which is extremely fertile. It is on the line of the Northern Pacific Railroad, and of easy access to settlers. About 2,000 acres are under cultivation, and yield well. Wheat-raising in this county will be one of the great businesses of its future, and the flouring-mills at Bismarck furnish a good market.

Burleigh County lies west of Kidder, and borders on the Missouri River. It contains 1,843,000 acres of good land, and is well settled. Bismarck is the shire-town, and for a long time has been known as the terminus of the Northern Pacific Railroad. It contains about 3,000 inhabitants, and is now a commercial center. It has both railway and river transportation, and no less than forty steamers ply from this town, up and down the Missouri, to the settlements and military posts along its banks. Heavy freights are carried over the Northern Pacific east, and it has a stage transportation company running to the Black Hills.

The country around Bismarck is beautiful and fertile, and there are some fine farms. Wheat, oats, and corn are grown, and the land produces well. Of wheat, 25 bushels per acre were raised last year; oats, 50 bushels per acre; corn, 105 bushels. On some land 150 to 300 bushels of potatoes grew, and all the vegetables are abundant and of remarkably fine flavor. The wheat is of superior quality and makes good flour. Timber in this county is quite plentiful, and coal is near at hand, large beds of it having been found in the adjoining country, on the line of the Northern Pacific road.

Crossing the Missouri River at Bismarck, one enters the "Great American Desert." The first evidence of the sterility of this country is the smart little town of Mandan, containing 500 inhabitants. It is located on the bank of the beautiful Heart River, at its junction with the Missouri, and is surrounded on three sides by a rich agricultural region. More than fifty farms are bearing crops, and scores of new ones are being opened up. A broad plateau, surrounded by hills, lies back of Mandan, and the scenery is beautiful. Looking up the Heart River, a prospect meets the eye that reminds one of anything else than a desert. Hundreds of cattle are seen grazing on the hills. The groves of timber along the stream afford the cattle all the shelter they need, even in the coldest of weather, and not a mouthful of hay need be cut for feed. Numerous small streams empty into the Heart River, watering the country well. The Northern Pacific Railroad

runs along Heart River to the Little Missouri. Sweetbrier Creek is an open, pretty valley. The Badger Valley is rich and attractive, and, on reaching the "summit," the highest point attained by the railroad on this division, a splendid stretch of fertile prairie appears.

From the Little Missouri west to the Yellowstone, after crossing the narrow belt of bad lands, the country is fertile and well watered by many streams. Lignite coal abounds, and mines are now in successful operation. The best building-stones can be procured from the bluffs, and the clays afford excellent material for making brick. The Government owns every alternate section of these lands, and they are open to settlement by pre-emption, homestead, and tree claims.

One of the best large farms in Dakota is Mr. Dalrymple's. It consists of 75,000 acres, and cost from 40 cents to \$5 per acre five years ago. The taxes are ten cents per acre per annum for school, road, and county purposes. There is no government tax. The farm is laid off into 5,000-acre tracts, with a superintendent over each division. He has a foreman and a gang-foreman under him. The superintendent subdivides his 5,000 acres into 250-acre lots, and these also have foremen. All the business is conducted on regular vouchers, and all supplies are drawn on requisitions, the same as in the army. The division foreman gives all orders. Money is paid on time-checks, and each workman receives his money whenever he wants it. Mr. Dalrymple is cultivating 25,000 acres, and 5,000 acres are being added each year. The crops are sowed in April, and about three weeks are taken for the planting season. Wheat of the Scotch Fife variety is planted, and one bushel and twenty quarts is sown per acre. All the planting is done by machinery. It takes 400 head of horses and mules to plant the crop. One seed-sower plants about two hundred acres, and each harrower drags about one hundred.

The new land is broken after the crop is in, and the breaking is generally commenced early in May. The land produces No. 1 hard Fife wheat, and the yield is twenty to twenty-four bushels per acre.

The cutting of the crop commences August 1st, and 115 automatic binders and harvesters are used. Of these, 100 are Wood's patent and 15 McCormack's. The sheaves are bound with wire. The thrashing-machines used are twenty-one in number. The crop is cut in twelve days, and about one thousand bushels per day are thrashed on each thrasher. The thrashers take a gang of twenty-five men and twenty horses for each to haul wheat to the machines and then haul it to the cars. No stacking is done on the farm. As many as fifty cars per day are loaded with wheat at this farm, the average per car being 400 bushels. An expert on horseback attends each two harvesters when they are at work.

The seed-wheat is taken from the new land,

and all the surplus grain is put into market immediately after harvest. The first yield of wheat from the land is usually the best; the average weight of wheat raised on this farm is fifty-nine pounds. The workmen on the farms are mostly Swedes, Danes, and Germans. In the spring months they are paid \$18 per month and board, during the cutting season \$2.25 per day and board, during the thrashing season \$2 per day and board, and in the fall \$25 per month and board. In winter only one man for each forty head of horses is retained in service, and he is paid \$30 per month.

The cost of living in the Northwest is not much, if any, greater than in the East. The following is the Fargo market on the line of the Northern Pacific Railroad:

Beef, 7½ cents per pound; mutton, 7 cents; pork, 6 cents; milk, per quart, 5 cents; hams, 10½ cents per pound; salt pork, 200 pounds for \$12.50; venison, 8 cents; turkeys and chickens, 12 cents; fresh fish from Lake Superior, 6 cents; lard, 8½ cents; eggs, per dozen, 20 cents; butter, per pound, 25 cents; potatoes, per bushel, 60 cents; onions, per bushel, 60 cents; beans, per bushel, \$2.25; corn, per bushel, 56 cents; oats, per bushel, 50 cents; wheat, per bushel, \$1; groceries, dry goods, hardware, and lime, about the same as Eastern prices; work-horses, per head, \$150; driving-horses, \$175; common "plugs," \$50; mules, \$150 per head; bronchos, \$60; ponies, \$10 to \$30; oxen, per yoke, good, \$125; common, \$80; milch-cows, \$25 to \$35 per head; beef-cattle, on the hoof, 2½ to 3 cents per pound.

DAVIES, HENRY E., born at Black Lake, near Ogdensburg, New York, February 8, 1805; died in New York city December 17, 1881. Descended from a well-known and highly respected family of Connecticut, he was bred on his father's farm, and until his fourteenth year attended a common school. Then, in conformity with a custom of those days, he went to live in the family of a lawyer, under whose direction he could pursue at the same time a collegiate and a legal course of study. His preceptor was Alfred Conkling, afterward Judge of the United States Court for the Northern District of New York. Young Davies was admitted to the bar in 1826 at the general term held in Utica, and began his practice in Buffalo, where he soon became prominent in politics as a Whig. In 1830 he removed to New York, and shortly afterward formed a partnership with ex-Judge Samuel A. Foote, which lasted for seventeen years. In 1848 this partnership was dissolved, and Mr. Davies, who had accumulated a large practice and high reputation, entered into a partnership with ex-Judge William Kent, a son of Chancellor Kent. In 1835 Mr. Davies married a daughter of John Tappan, of Boston, whose brothers, Lewis and Arthur, were famous abolitionists. About 1840 he served as alderman for the Fifteenth Ward, in which he resided, and in 1850 was chosen Corporation Counsel by the Common Council.

In the fall of 1855 Mr. Davies ran for Justice of the Supreme Court, to succeed Robert H. Morris, deceased, and was opposed by Edward P. Crowley and Henry Hilton. No notice of a vacancy having been filed with the sheriff by the Secretary of State, a question arose which was very similar to that in reference to Richard O'Gorman and the Superior Court. It was decided by litigation in favor of Mr. Davies, who had been elected by the popular vote. In the summer of 1855 Judge Davies accompanied ex-President Fillmore to Europe, having been the intimate friend and confidential adviser of the latter during his term of office as Chief Magistrate. In the autumn of 1859 Judge Davies was elected to the Court of Appeals, where he served from January 1, 1860, to 1869, being the Chief-Justice for several years. He then entered into partnership with Judge Noah Davis, with whom he practiced until the latter was elevated to the bench. After that time Judge Davies was conspicuous only in his practice as counsel and trustee of the Mutual Life Insurance Company, receiver of the Erie Railway, counsel for the American Exchange Bank, and member of the commission to determine the advisability of constructing an underground railroad in Broadway. The day before his last illness he sat for many hours listening to testimony on that subject. Of late years he took no part in politics. He served often as referee or chamber-counsel in important legal cases. Two celebrated murder cases were before him while he was Chief-Justice—those of Caccerni and Burdell—the former being remarkable because a trial had proceeded by consent of both sides with only eleven jurors, and on this account the verdict had been set aside. Judge Davies was distinguished for integrity, energy, and industry, as well as for his mental vigor and strength of will.

DELAWARE. The Legislature of this State opened its biennial session on January 4th. As presiding officers of the two Houses, both called "Speakers" in Delaware, C. F. Rust was elected in the Senate on a vote of 7 in 9, and Reynear Williams in the House of Representatives, by a vote of 13 in 21; his competitors, Edward G. Bradford, Jr., and John Pilling, having received 6 and 1 respectively, one vote recorded as blank.

For the State finances and public indebtedness, see "Annual Cyclopædia," 1880. A recommendation made by the Governor to refund the State debt in its entirety by the conversion of all outstanding bonds into new ones, payable in twenty years, and bearing interest at the rate of four instead of six per cent per annum, was acted upon by the General Assembly, and a law passed for that purpose. Its main provisions are that the bonded debt (\$847,000) be refunded in \$1,000 four-per-cent bonds; and that the whole loan be disposed of to the highest bidder.

In the matter relating to the four national banks which do business in Delaware, but re-

fused to pay the State taxes assessed on the shares of their capital stock, and informed the State Treasurer of their reasons for such refusal, the Governor urged the Legislature to determine the question by instructing the Treasurer to commence suits against them in accordance with the Attorney-General's opinion transmitted to them with the Treasurer's report. A joint resolution was therefore passed by both Houses, appointing a special committee "on arrears of national banks."

The system in Delaware which gives no salary to county officers, but compensates them for their services with the legal fees paid by the parties with whom they may have official business, is regarded as unjust to the public servants, "because they are compelled to render a considerable gratuitous service," and the fees prescribed by statute, in many instances, are never paid by the parties liable therefor. This result caused complaint and dissatisfaction on the part of the officers concerned; and, as a remedy of the evil, it was proposed to pass a law authorizing the payment of such officers, as far as practicable, by annual salaries, payable monthly, commensurate with the labor performed, in lieu of the fees pertaining to such offices; the fees now by law taxable by such officers to be by them taxed and received as heretofore, and paid to the State Treasurer—such law to take effect as the terms of the present incumbents expire.

The public schools in some of the rural districts being usually closed earlier in the year than elsewhere, apparently from lack of means to keep them open for a longer time, a consolidation of those districts was proposed, and also that an amount of money should be annually levied, sufficient to keep the schools of each district in operation during eight months' time. The Legislature provided for this by enactment of a law entitled "An act supplementary to the existing law in relation to free schools." It directs the Governor to appoint, in addition to the Superintendent of the Public Schools, an Assistant Superintendent, the term of his office being one year; and fixes his annual salary at \$800; that of the Superintendent at \$1,500. It provides also for the establishment of a State Board of Education, which is to consist of the Secretary of State, the President of the Delaware College, and the Superintendent of Public Instruction. The act further provides that, besides the sums voted by the people of each school district for the support of their respective schools, taxes for each school district in the three counties of the State shall be levied and collected annually in the month of April, and distributed among the school districts in the proportional sums of \$160 for each district in New Castle County, of \$125 in Kent County, and of \$60 in Sussex County.

The Governor called the attention of the Legislature to "the open and unblushing bribery and intimidation alleged to have been

practiced at the recent elections in this State"; pointed out the effects which such practices must necessarily produce, if not put down; and concludes with these words: "I desire most earnestly to recommend that you take into consideration the necessity of adopting such measures as will prevent the repetition of such offenses against the purity and freedom of the ballot." The General Assembly then enacted a law, entitled "An act to secure free elections." It imposes a penalty of from \$500 to \$1,000 fine on any person, firm, or corporation that shall endeavor to influence, by bribery, threats, or intimidation, the vote of an employé; and empowers the employé, in addition, to bring suit against his employer for the payment to him, as in an action for debt, of \$500. It provides further that, if the employer be an actual person, he shall be liable also to one year's imprisonment. The act of any officer of a corporation, acting for the corporation, shall be considered the act of the corporation itself; but such officer shall also be individually liable.

A special joint committee was appointed by the two Houses "to examine the State Library," which committee performed its duty, and reported a joint resolution, authorizing the State Librarian to cause all necessary shelving for books to be erected; requiring him to compile a catalogue, and have it printed for the usual distributions; and empowering him to draw on the State Treasurer for \$500 to pay the expenses of its publication.

The session of 1881 closed on April 9th. Of the ninety-eight days of its continuance, about sixty-five were employed in actual work. Among the acts and joint resolutions of a general character passed at this session are the following:

An act "for the preservation of the public health." It authorizes the establishment of local boards of health in all the towns and villages of the State, and defines their duties.—"To provide for the registration of marriages, births, and deaths in the State of Delaware."—"To provide for the better security of life and property in case of fire." It imposes on the owners of hotels, factories, school-houses, and other public buildings, the duty of providing them with suitable fire-escapes.—"To exempt sewing-machines of seamstresses and private families from execution, attachment-process, and from distress for rent."—"To provide a uniform ballot for election-officers." It prescribes that the ballots shall be printed on paper-pieces six inches long and three inches wide; the paper to be furnished by the Secretary of State. The ballots are to be without any distinguishing marks of any character, except the name of the party printed on the inside. No ballot is to be counted which does not conform to these provisions.—"To prevent political parades in the night-time in this State." It imposes fines, ranging between five and twenty dollars, on every person tak-

ing part in any political torch-light parades, "marching through any public road, or street, in this State, in the night-time."—"To provide for the better analysis of fertilizers, and for the proper stamping of every package sold in this State."—"To create the office of a State Commissioner on Fish and Fisheries, and to provide for his compensation." The act authorizes the Governor to appoint such commissioner; defines the commissioner's duty to be to receive fish and spawn, and distribute them into places where they are needed; fixes the term of his office at two years, and the compensation for his services at two dollars for every day actually employed in the performance of official duties, besides the reimbursement of his expenses.—An act relating to the militia of the State, "in amendment to chapter xv of the Revised Code." The act appropriates \$1,200 annually for the support of the organized militia; empowers the Adjutant-General to sell all useless arms and accoutrements, and distribute the proceeds among the several militia companies *pro rata*; and fixes the salary of the Adjutant-General at \$200 a year. The act determines also the Governor's staff.

The following joint resolution in relation to the Irish troubles was unanimously adopted by the House of Representatives on March 3d, and concurred in by the Senate:

Resolved, by the Senate and House of Representatives of Delaware in General Assembly met, That the people of Ireland, oppressed by the misgovernment of rulers, and excited by the selfish appeals of domestic agitators, are entitled to the sympathy of mankind; and this General Assembly tenders to them the assurance of their sincere regard, and the expression of their earnest wish that such settlement of their difficulties may be had as will secure their highest and most enduring prosperity.

By the *viva voce* vote, separately taken in the two Houses on January 18th, Mr. Bayard was re-elected United States Senator, the votes having stood as follows: In the Senate—Bayard 8, Higgins 1; in the House of Representatives—Bayard 14, Higgins 7.

The office of a State Commissioner on Insurance has been established in Delaware, and it was organized for practical operations on July 1, 1879, under the provisions of a special law passed March 24th of that year. The first report submitted by this officer to the Legislature, in February, 1881, shows the number of insurance companies doing business in the State in 1879 to have been 53; namely, 6 home companies, 27 fire and marine insurance companies of other States, 17 foreign fire-insurance companies, 2 life-insurance companies, and 1 life and accident insurance company. During the year ending January 31, 1881, these corporations numbered 67, classified as follows: Six insurance companies chartered under the laws of the State, one of them being a joint-stock company, and 5 mutual fire-insurance companies; 32 fire and fire-marine insurance companies of other States, 20 foreign fire-insurance companies, 8 life-insurance companies of other

States, 1 life and accident insurance company. The amount received directly for taxes by the State Treasurer from the fire-insurance companies was \$375 in 1879, and \$300 in 1880, making a total of \$675 for the two years.

The following is a comparative statement of the condition of schools in Delaware at the end of 1878 and 1880:

SCHOOLS.	1880.	1878.
Number of schools in the State...	512	507
Number of white children of school age (five to twenty-one years)...	31,505	
Number of colored children of school age.....	3,954	
Total amount of State appropriations and contributions.....	\$177,651 89	\$216,539 65
Decrease in 1880.....	\$98,857 76	
Cost of public education <i>per caput</i>	\$6 89	\$7 72
Number of white children attending school.....	25,053	23,830
Number of colored children attending school.....	2,216	1,663
Average number of population of school age to each school.....	60	53
Average number enrolled in each school.....	49	53
Number of teachers employed:		
Male.....	248	423
Female.....	175	
Whole number of teachers employed, including the city of Wilmington.....	536	513
Average monthly salary paid to teachers:		
Male.....	\$30 58	\$30 16
Female.....	\$24 79	\$24 71
Number of schools visited.....	263	264

The aggregate value of school property in the State for 1880 is set down at \$440,733, made up as follows: School-houses, \$331,260; school-grounds, \$75,669; school furniture, \$33,804.

For the benefit of colored children of school age, the Legislature of 1881 has enacted a law "supplementary to the existing act to encourage the education of the colored people." It appropriates \$2,400 of State money (\$800 to each of the three counties) annually, to be paid in October to the Treasurer of the Delaware Association for the Improvement of the Colored People, and to be distributed by him in proportional sums among such colored schools in the several counties as have been kept open for at least three months in the year, and have been attended by at least twenty scholars each. The school-taxes paid by the colored people are to be expended within the hundreds in which they are raised.

To provide for a participation of the Delaware militia and State officials in the celebration of the centennial anniversary of the surrender of the English army at Yorktown, Virginia, on October 19, 1781, the following preambles and resolution were passed by the two Houses of the General Assembly of 1881:

Whereas, At a meeting of the Governors of the thirteen original States, held in the city of Philadelphia, in 1879, in the old Independence Hall, it was determined to celebrate the surrender of Cornwallis at Yorktown; and

Whereas, It is an event in which the people of Delaware feel a profound interest on account of the significance of the result, achieved by the patience,

endurance, courage, and patriotism of our colonial ancestors; and

Whereas, It is proper that the remembrance of the hardships and perils incident to the Revolutionary struggle should be preserved: therefore, be it

Resolved, That the Governor be and he is hereby authorized to make such arrangements as he shall deem necessary for a proper participation of the State officials and the militia in the celebration of the centennial anniversary of the surrender at Yorktown; and to defray the expenses thereof he is hereby authorized to draw his warrant upon the State Treasurer for a sum of money not exceeding \$2,000.

The First Regiment of Delaware—six companies of infantry—with band and drum-corps, attended the celebration at Yorktown.

Extracts recently published from official records of the votes polled in the State for the election of her two Congressmen in 1812 and 1880 may show the growth of Delaware in the number of voters, and proportionally in population, during the sixty-eight years intervening. In 1812 the aggregate vote cast for her Representatives in Congress (two scattering votes included) was 14,809, distributed among four candidates, as follows: Henry M. Ridgely, 4,193; Thomas Cooper, 4,183; David Hall, 3,221; Richard Dale, 3,210. The first two named of these competitors were awarded the certificates of election to represent Delaware in the Thirteenth Congress; their official term being then three years, reduced to two years in 1818. In 1880 the votes polled in the State for her Congressmen numbered 29,420; all of which, except 122, were almost equally divided between two candidates—E. L. Martin 14,966, and John W. Houston 14,332—who received their certificates of election to represent Delaware in the Forty-seventh Congress.

By the new general apportionment of State representation, based on the returns of the United States census of 1880, as fixed by the act of Congress, passed in March, 1881, and to be in force "from and after the 3d of March, 1883," Delaware loses one of her two Representatives in the Lower House of the Federal Legislature, the said act entitling her to one member only.

DENMARK, a kingdom of Northern Europe. The reigning sovereign is Christian IX, fourth son of the late Duke William of Schleswig-Holstein-Sonderburg-Glücksburg, appointed to the succession of the Danish crown by the Treaty of London of May 8, 1852, and by the Danish law of succession of July 31, 1853. He succeeded to the throne on the death of King Frederick VII, November 5, 1863. He was married May 26, 1842, to Louise, Princess of Hesse-Cassel. The heir-apparent is Prince Frederick, born June 3, 1843, and married July 28, 1869, to Louisa, only daughter of King Charles XV of Sweden. Their children are three sons, born in 1870, 1872, and 1876, and three daughters, born in 1875, 1878, and 1880. The second son of the King is King of Greece. The oldest daughter, Alexandra, is wife of the Prince of Wales; the second, Dagmar, wife of the Czar of Russia; the third,

Thyra, wife of the Duke of Cumberland, who is the claimant to the throne of Hanover.

The King has a civil list of 500,000 rigsdalers, and the heir-apparent of 60,000 rigsdalers.

The ministry of 1880 continued in office during the year.

The area of Denmark is 33,302 square kilometres; the population on February 1, 1880, was 1,969,039. The area of the colonies is 192,209 square kilometres (1 square kilometre = 0.386 square mile), with a population of 130,350. The area and population of the several provinces and colonies were as follows:

TERRITORIAL DIVISIONS.	Sq. kilo- metres.	POPULATION.		
		Male.	Female.	Total.
DENMARK.				
City of Copenhagen....	20	108,552	125,998	234,550
Islands.....	19,017	425,344	439,834	865,078
Jutland.....	23,265	432,664	435,517	868,181
Total Denmark....	83,802	967,860	1,001,679	1,969,039
COLONIES.				
Faroe Islands.....	1,333	5,476	5,745	11,221
Iceland.....	102,417	72,000
Greenland.....	88,100	9,531
Danish West Indies...	858	87,600
Total colonies.....	192,208	180,350
Grand total.....	280,510	2,099,400

The population of the principal cities was as follows in 1880:

Cities.	Population.
Copenhagen.....	234,550
Copenhagen (with suburbs).....	273,823
Aarhus.....	24,531
Odense.....	20,804
Aalborg.....	14,152
Randers.....	13,457
Horsens.....	12,652

The population in 1880 was distributed as follows among the different religious denominations:

Denominations.	Population.
Lutherans.....	1,951,361
Reformed.....	1,368
Catholics.....	3,000
Baptists.....	3,657
Irvingians.....	792
Mormons.....	1,722
Other sects.....	1,919
Jews.....	3,946
Mohammedans.....	8
Belonging to no denomination.....	1,074
Unknown.....	167

Of the total population in 1880, 1,904,750 were born in Denmark, and 64,289 abroad. Of those born abroad, 535 were born in Iceland, 212 in Greenland, 225 in the Faroe Islands, 334 in the Danish West Indies, 33,152 in Germany (of these, 2,207 in the province of Schleswig), 24,148 in Sweden, 2,823 in Norway, 454 in England, 334 in Russia, 182 in Austria, 138 in France, 328 in other European countries, 512 in non-European countries, and 862 unknown.

The number of emigrants in 1880 was 5,667, of whom the majority went to the United States.

The annual financial accounts, called *stats-*

reguskaß, for the years 1878-'79 and 1879-'80 (the financial year closes on March 31st), were as follows (in crowns—1 crown = 27 cents):

YEAR.	Revenue.	Expenditure.
1878-'79.....	46,065,263	42,113,656
1879-'80.....	47,521,957	44,170,634

In the budget for the year 1880-'81, the revenue was estimated at 47,246,558 crowns, and the expenditure at 41,672,448 crowns.

The national debt of Denmark has been in the course of reduction since 1866, and from 1877 to 1880 was as follows:

DEBT.	1877.	1878.	1879.	1880.
Internal debt...	158,959,192	158,974,096	159,382,778	159,422,961
Foreign debt...	17,289,250	15,449,650	15,376,650	13,908,667
Total.....	176,248,442	174,423,746	174,759,428	173,331,628
State property.....	66,218,569	89,949,359	96,056,278	98,059,731
Debt proper.....	90,029,873	84,474,387	78,703,150	72,266,597

The total strength of the Danish army in 1880 was as follows:

ARMY.	REGULAR ARMY.		ARMY OF RESERVE.	
	Officers.	Rank and file.	Officers.	Rank and file.
Infantry.....	801	26,992	245	10,925
Cavalry.....	139	2,180
Artillery.....	175	4,755	49	2,793
Engineers.....	61	624
Total.....	1,176	34,551	294	13,713

The staff consisted of 25 officers and 16 non-commissioned officers.

The navy in 1881 was composed as follows:

VESSELS.	Horse-powers.	Guns.
STEAMERS.		
<i>a. Iron-clads.</i>		
2 frigates.....	2,687	44
3 floating batteries.....	3,980	12
2 enarmed vessels.....	6,098	22
2 torpedo-boats.....	3,000	10
<i>b. Other steamers.</i>		
2 frigates.....	2,350	54
3 corvettes.....	4,050	50
5 schooners.....	4,040	26
12 gunboats.....	2,629	27
2 side-wheel steamers.....	1,693	..
33 steamers.....	30,527	245

In addition there were the following sailing-vessels: 2 frigates, 1 brig, 2 cutters, and 20 transport-vessels.

The commercial navy was as follows in 1880:

VESSELS.	Number.	Tons.
Sailing-vessels.....	3,073	208,720
Steamers (13,361 horse-power)...	193	48,526
Total.....	3,271	257,546

The movement of shipping in 1879 was as follows:

VESSELS.	SAILING-VESSELS.		STEAMERS.		TOTAL.	
	Number.	Tons.	Number.	Tons.	Number.	Tons.
Entered. { Coasting-vessels.....	14,171	164,788	6,770	151,347	20,941	316,135
{ Ocean-vessels.....	13,418	792,399	6,445	420,660	19,863	1,153,559
Cleared. { Coasting-vessels.....	14,885	142,028	6,944	139,504	21,829	281,532
{ Ocean-vessels.....	12,657	161,801	6,262	252,177	18,919	413,973

The following table exhibits the value (in crowns) of Danish commerce in 1879:

COUNTRIES.	Imports.	Exports.
Great Britain.....	47,183,000	63,585,000
Germany.....	72,760,000	54,027,000
Sweden.....	18,566,000	20,048,000
Norway.....	5,231,000	8,335,000
Russia.....	10,632,000	690,000
Holland.....	5,683,000	950,000
Belgium.....	3,096,000	1,322,000
France.....	3,135,000	2,267,000
Iceland.....	4,165,000	2,863,000
Greenland.....	579,000	625,000
United States.....	10,530,000	696,000
Danish West Indies.	1,830,000	228,000
Brazil.....	269,000	14,000
Færoe Islands.....	436,000	388,000
Other countries . . .	15,158,000	1,550,000
Total.....	199,053,000	158,063,000

The aggregate length of railroads in operation in 1879 was 1,576 kilometres (1 kilometre = 0.62 mile); of these, 1,240 kilometres belonged to the state and 335 to private companies. The number of post-offices was, in 1879, 164; the number of letters and postal-cards mailed, 27,422,333; of merchandise and printed matter, 2,195,221; of newspapers, 25,733,527. The aggregate length of state telegraph lines was 3,444 kilometres; of wires, 9,115; the number of telegraph-offices was 124. Besides the state telegraph lines there were 137 offices of railroad telegraphs opened to the public. The number of dispatches sent in 1879 was as follows: 422,848 inland, 522,147 international, and 24,128 service dispatches, making a total of 969,123 dispatches.

Denmark found herself during this year in a dilemma such as had not before arisen in any constitutional country. The financial policy propounded by the ministry met the views of the Second Chamber. But the popular Chamber opposed totally the financial projects of the Cabinet, and refused, by a large majority, to agree to the budget until it should be stripped of every feature attaching to the fiscal policy of the Government. The Cabinet did not feel called upon to resign as long as they reflected the opinions of a firm majority in the co-ordinate branch, and since their policy and their course of action met with the hearty approval of the King. An appeal to the country resulted in the re-election of the same men to the popular assembly, and thus rendered more hopeless any escape from the difficulty except the complete surrender of its legislative authority by the Senate. Parliament was dissolved by the advice of the ministry a second time, the third dissolution during the whole contest. The people responded by electing a still heavier majority of the Opposition party.

VOL. XXI.—14 A

The Left, in order that they might carry on the conflict with the Landsting and the King to the end, voted temporary supplies for the regular expenses of Government. The Landsting agreed to this measure of relief with reluctance. Upon its term of expiration it was continued indefinitely, pending the struggle over the budget.

The contest resolved itself into the question whether the Government was not answerable to the people, and ought not to submit to the clearly expressed will of the country, as declared by universal suffrage. Estrup and his colleagues in the ministry insisted as a matter of principle that the authority of the Second Chamber and the prerogative of the crown should not be subordinated to the popular branch of the Legislature. The opposition, led by Berg and Holstein-Ledreberg, determined to carry through the principle that the Lower House should entirely control the supplies, and that the arbitrament of the ballot should be decisive in the politics of the country. The ministry withdrew nearly the whole of the disputed items in the budget, until it was no longer a question of financial policy. The insignificant sum, which the ministry still insisted upon and the Opposition objected to, was a mere pretext, the real issue being the responsibility of the ministry to the people. The Left demanded the resignation of the ministry and the formation of a Cabinet from their own ranks, and, in case this did not remove the difficulty, the dissolution of the Landsting.

Measures for the acquisition of railroads by the state were carried in the Folkething in January. It was voted to acquire the East Jutland road, and to construct the projected railways from Tommerop to Assens, and from Rivo to Glyagoro.

The right to furnish passing ships with victuals and marine stores out of the bonded warehouses of Helsingor without the payment of duty, has been granted.

The question of civil marriage came up in the Folkething on the occasion of a private bill. Civil marriage has existed since 1851, but only for dissenters from the national church. It appeared that clergymen frequently refused to marry divorced persons, being prompted by their religious scruples to defy the law. A bill was introduced to extend civil marriage to divorced persons. In a mutual interchange of opinions several spoke in favor of making the civil form general and obligatory.

Three differences of long standing existed between the Government and the representative body. The Government desired to preserve the university fund intact, and pay

the deficit of the university from the public treasury, while the Folkething proposed to cover it out of the capital fund of the university, as has been done before. The difference with reference to the army appropriations was not serious. The question of raising the salaries of officials has long divided the two Things, the Landsting wishing to extend the benefits of the measure to the intermediate officials, and the Folkething to confine them to those of lower grades.

The Government was still unable, after six months of strife, to induce the legislative majority to adopt any part of its programme. On May 7th the King dissolved the Legislature, declaring that "it lacked either the capacity or the will to discharge even a small part of the weighty business which was laid before it." Of 112 projects for legislation brought into the two Houses, 80 had not yet been passed upon, including the budget bill, the matter of supplementing officers' salaries, regulation of the salaries for certain posts, a system of intendants for the army, the inspection of merchant-vessels as to seaworthiness, and other important and pressing measures. The elections took place on the 24th of May. The composition of the new Parliament was not materially different from the last. The majority of the members were re-elected. The 102 representatives in the Folkething were chosen from the different social classes in the following proportion: 37 were farmers; 20 officials and lawyers; 14 teachers; 11 writers, capitalists, etc.; 10 land proprietors; 8 officers, and 2 tradesmen. Copenhagen and the surrounding district elected most of the members of the Right, Northern Fünen and Northern Jutland the Moderates, Northern and Middle Jutland the seceders, who formed the new Center party, and Southern Fünen and Southern Jutland the so-called Radicals. There were 17 new men elected. The body was as badly split up into factions as the Folkething which had been dissolved. The Radical Left counted 29, the Moderate party 23, the Right 33, and the ultra-Conservatives 17. The Moderates and Ultras elected the president, Krabbe. Holstein-Ledreberg declared, on the part of the Left, that his party would not recede from the position they had taken in the former Parliament. Estrup, president of the Council, answered that then no budget could be voted, since the Landsting were in accord with the Government. The temporary allowance for the current necessities of the Government, which had been voted, expired June 30th. The Minister of Finance requested the continuance of the provisional appropriations until an agreement on the law should be reached. This was granted. Although the Right conceded point after point until the sum of the items in dispute was reduced from 1,115,000 to 200,000 crowns, the Left would listen to no compromise. The ministry were not disposed to resign and confide the direction of the Govern-

ment to the hands of the Radicals. Consequently, the Folkething was again dissolved, July 6th. The new election on the 26th returned a still stronger majority of the Left to the Folkething. The Radicals gained 3 seats and counted 32 votes; the Right lost 2 and numbered 22; the Moderates were 24 in number instead of 22; and the Ultras counted 19 votes, a gain of one. The Opposition numbered 75 to 26 ministerialists. The Parliament assembled August 8th. The Crown Prince prepared the address, in the absence of the King in Austria, which was read by the Minister-President, Estrup, without eliciting the usual cheers. Krabbe was again elected president. The ministry announced that in case the Parliament failed to pass a financial bill it would not again be dissolved, but would be prorogued to the regular session, commencing October 3d, while the Government must content itself with the provisional supplies. The Landsting made only four amendments in the financial bill as it came up from the Folkething, involving less than 200,000 crowns, omitting all the other points of strife. The Folkething rejected the amendments by a vote of 71 to 21, and the Landsting, by a majority of 49 to 7, insisted upon the four items. The extraordinary session was then closed by the Crown Prince, on the 30th of August. Parliament opened October 3d without an address from the throne, and, after organizing, adjourned to November 29th.

The political condition of Denmark is in many respects peculiar. Over one half of the population are engaged in agricultural pursuits. This body of agriculturists are prosperous, intelligent, and exceedingly active politically, and progressive in their opinions. Yet within a life-time this same class languished in a state of practical serfdom. Strachey, an English student of Danish affairs, says: "The Danish *Jorddrot* (landlord) was, till recent times, the scourge of the peasantry. Under his parental love the Danish *Bonde* (farmer) was a mere hewer of wood and drawer of water; his lot was no better than that of the most miserable ryot of Bengal. The *Bonde* is now the freest, the most politically wise, the best educated of European yeomen." This social reform has been accomplished by the co-operation of all classes. The advance from the feudalism of the middle ages to the van of modern progress, accomplished in a short period, has brought about a combination of political ideas and social habits not found in other countries, and resulted in a political organization and legal arrangements which are peculiar and in some respects worthy of imitation. The Danish nobility, who have so lately abdicated the privileges of their order, naturally hold very enlightened and advanced political and social theories. Naturally, also, they preserve much of the pride of feudal barons and the habits of social caste. In feudal society, the spirit of caste runs through all ranks, and in Denmark

the habits of mind belonging to that condition are found in the present transitional state to co-exist with intellectual convictions of the most progressive character. The sturdy Danish peasantry, who are descended from a race of freemen, and who, when again emancipated from the feudal yoke, have made such astonishing intellectual and material progress, feel themselves fully competent to guide and control the political destinies of the nation. This they will be empowered to do if the theory of popular sovereignty is adopted into the fundamental law. The upper classes, on the other hand, nurtured as they have been in the habits of political rule, and regarding the peasantry, whom they have helped to elevate, as still in a state of tutelage, stubbornly maintain the existing constitutional barriers against democratic ascendancy. From these political conditions has arisen the present constitutional struggle. The same conservatives who insist upon preserving the aristocratic features remaining in the Constitution, are often extremely democratic and radical in their own doctrines. The conflict between the Folkething and the Lands-thing and crown is a conflict between classes for political power. But there is no real issue at present, nor are there likely to arise any material differences between the classes. Hence, very trivial questions are seized upon as a pretext for an exciting political conflict; and a constitutional crisis can be brought on by the first small matter of difference between the Government and the majority of the Lower Chamber, until the King chooses his Cabinet from the party controlling the vote of the direct representative Chamber, as is done in most constitutional countries.

The land system of Denmark has, within a generation, by a series of constitutional reforms, been quietly revolutionized. The leasehold farms have been converted into freehold properties of 60 or 70 acres each, where the land is good, and of larger extent where it is inferior. The commutation of the feudal tenure, by which the soil of Denmark was held fifty years ago, into peasant proprietorship, has been accomplished by a system of time-purchase prescribed by law and so arranged as to effect the transition successfully and without hardship. Three quarters of the land had passed, ten years ago, into the hands of 70,000 yeomen, nearly every one of whom owned the fee of his farm. The farms average about 100 acres. One eighth of the remaining surface is apportioned in lots, averaging 5 acres in size, among 137,000 peasants, two thirds of whom own their holdings. With regard to the portion of the land still held on lease, the proprietary rights of the landlord are only partial. The few farms which are still held under leases for life pass to the child or heir of the last tenant by a custom which has all the force of law. The manorial estates of the landlord class are the only part of their land over which they possess more than a concurrent ownership.

There were in 1869 1,750 of these estates, averaging about 370 acres, and not covering more than one eighth of the cultivated land of the country. The tenant-rights and customs linking the peasant to his land, which were incident to the feudal system, were so interpreted and enlarged that the land has passed into the proprietorship of the cultivators instead of becoming the absolute property of the feudal lords as in some other countries. The feudal land laws have been abolished by parliamentary action, the greater part of this work having been accomplished since 1849. Socage service has been done away with. Tithes have been commuted, and the game laws reformed. All the legislative efforts have been avowedly and liberally directed to the advantage of the peasantry, and feudal rights have been extinguished or commuted in the interest of a peasant proprietary. The policy of securing to the cultivators the ownership of the soil has been consistently followed by the Legislature, and those whose rights have been set aside in the interest of this great social and economical reform have acquiesced and taken a hand in the work. The lands belonging to the state and to public institutions and corporations were transferred to peasant proprietors by a series of laws passed between 1851 and 1865. The holders of entailed and trust estates were authorized to sell farms to occupiers, and in 1866 a law was passed prohibiting the creation of new entails. The abolition of entails and feudal dues has resulted in the ownership being transferred to the occupants. But the Danes have not been contented with the temporary achievement of this object. Unlike countries in which the feudal system was abolished earlier, the land of Denmark has not been made free, or reduced to the state of a merchantable commodity. The state has interposed its authority and imposed restrictions on the sale and use of land. The land system of Denmark is, therefore, unique in its character. An owner is not entitled to unite several farms into a single holding nor divide a single farm into several holdings. Proprietors are prohibited under severe annual penalties from either absorbing or suppressing a farmstead, except under particular circumstances. A farmer may cultivate one and only one farm besides the one on which he resides. The principle of compulsion to lease, compelling every manorial landlord to let every vacant holding to a new tenant under the Danish life-lease, that is, for the life of the tenant or his widow, is still maintained, and where this does not prevail there is an obligation to lease out for shorter periods if desired. Proprietors are restricted by the forest laws from stripping their lands of timber. Titles and liens are recorded by a very perfect system of public registry; the total cost of the conveyance and registration of a piece of property upon changing hands is from one to three per cent of the purchase-money.

An examination of recruits summoned for military service showed that 86 per cent were able to read and write with ease, and only 1 per cent were totally illiterate.

A squadron of iron-clads, consisting of three monitors and two steam schooners, has been fitted out and placed in command of Vice-Admiral Wrisberg.

The King has revoked the decree of banishment uttered against the Schleswig-Holstein-Augustenburg family after the Schleswig-Holstein War of 1852. The late Duke Frederick, in violation of a compact by which the family received compensation for their demesnes in Denmark, asserted his claims to the throne of the duchies in 1863 and headed a revolt. His quarrel was embraced by Prussia and Austria, with the result that the duchies were annexed to Prussia and the ducal family shut out from the throne as before. The present head of the family is Prince Ernst Gunther, born in 1863.

The Minister of War, General Kaufmann, was appointed Commandant-General of Zealand in place of General Nielsen, retired. The office was placed temporarily in charge of the Naval Minister, Ravn, who was later appointed Minister of War.

On the resignation of Governor Gardc, April 1st, C. H. Arendrup was appointed Governor of the Danish West Indies. As the session advanced there appeared to be no prospect of an agreement between the law-giving branches on finance questions.

In answer to a query of the authorities of Holland regarding the importation of infernal machines from America, the Foreign Office expressed its willingness to examine invoices which are not addressed to firms of good standing.

The Icelandic Althing opened July 1st. Iceland rejoices in the comparatively large measure of liberty and independence which has been accorded it recently. The anxious period of the constitutional conflict has been succeeded by one of practical and peaceful progress. A legislative hall has been erected for the Althing in Reykjavik. In the upper stories are placed the National Library and a collection of Icelandic antiquities. The portrait of Jon Sigurdson, the champion of Iceland's independence, is a conspicuous ornament in the hall of sessions, and even the household furniture of the hero is preserved as a national treasure.

DEVILLE, ETIENNE HENRI SAINTE-CLAIRE, French chemist, was born in the Island of St. Thomas, in the West Indies, March 18, 1818, and died at Boulogne-sur-Seine, July 1st. He went to Paris in his boyhood with his brother, the late meteorologist, Charles Deville. Dumas's lectures first attracted him to the study of chemistry. His reputation was rapidly established. In 1844 he became professor at Besançon, and in 1851 was called to the Normal School in Paris, where he held the chair of Chemistry until his death, delivering lectures besides at the Sorbonne. His early studies

were in organic chemistry, but he soon directed his sole attention to mineral chemistry and inorganic analysis, in which field his reputation for thirty years was as high as that of any contemporary chemist. From his laboratory have emanated many great discoveries, some of them of high practical utility. Fruits of his earlier investigations were the synthesis of nitric anhydride, the discovery of toluole, and an improvement in the method of water-analysis in use at that time. His studies of the properties of the metal aluminum and his invention of the method of obtaining that substance in quantities attracted the attention of the world. He studied the metallurgy of platinum, and found out how it could be obtained in a pure state. He elucidated the properties of boron and silicon. Through his ingenuity the metal sodium was rendered obtainable on a large scale, so that its price sank from two thousand to fifteen francs a kilogramme, an invention which has led to important results both theoretical and industrial. Deville attained a proficiency in obtaining excessively high temperatures which was long unexcelled. The artificial production of minerals in his laboratory was a striking demonstration of his success in this direction. The opportunity which it afforded him of observing reactions and thermal phenomena at high temperatures led to the most important of Deville's discoveries—that of the laws of dissociation. Decomposition had previously been supposed to be a simple phenomenon which takes place at a certain fixed temperature for each compound, beginning and completing itself at that temperature. Deville showed that it is effected within a certain range of temperature, and in some cases is arrested by an equilibrium being established between the decomposing body and the products of decomposition. Deville recognized no theory which was not founded on the clearest kind of induction. He questioned the entire theoretical structure of modern chemistry, treating even the atomic theory as a groundless and useless speculation. Deville received a poor stipend from his professorship. The task of instructing beginners was irksome to him; but he was a very amiable teacher, and generously aided and encouraged younger investigators. He died in the possession of a comfortable fortune, being a director of the Municipal Gas Company. He was one of the chief promoters of the International Metre Commission in 1870. Although a man of enthusiastic temperament, his scientific caution and strict accuracy contributed not a little to the enviable reputation he bore in scientific circles.

DIPLOMATIC CORRESPONDENCE. (See NATURALIZATION PAPERS, PANAMA CANAL AND PERU, CHILI, AND UNITED STATES.)

DISCIPLES OF CHRIST. The annual meeting of the *General Christian Missionary Convention* was held at Indianapolis, Indiana, October 20th. The Board of Managers re-

ported that its total receipts for the year had been \$29,899, of which \$17,258 had been given in cash, the rest in pledges. The additional sum of \$52,342 had been obtained by eight State and missionary agencies, making a total amount for the co-operative work of the General and State Conventions of \$82,241. The whole number of additions reported by the State organizations and the General Convention was 2,884. More than \$30,000 had been contributed for the church to be built in Washington, D. C., the total cost of which is to be \$35,000. Special report was made of missionary work in Dakota, Oregon, Alabama, Colorado, Georgia, Kansas, Louisiana, Nebraska, North Carolina, Pennsylvania, South Carolina, Tennessee, West Virginia, and Wisconsin. A considerable extension of the mission-fields, and the establishment of a mission among the German population of the country, were recommended. An amended constitution was adopted, containing provisions by which persons contributing to the funds of the society might obtain, through representation in the convention, a voice in its management. The General Christian Missionary Convention was organized in 1849 under the name of the American Christian Missionary Society, and received its present name in 1869. The total amount of moneys contributed in 1881 was \$187,454, giving an annual average of receipts for thirty-two years of \$5,857. In addition to this amount, the State societies had contributed for their co-operative work, since 1870, the sum of \$623,077, making an average for each year of \$51,923. Since 1853, 16,669 persons, or an average of 694 for each year, had been added to the church through the General Convention; and, since 1870, 52,428 persons, or an average of 4,369 for each year, have been added through the State societies.

The sixth annual convention of the *Foreign Christian Missionary Society* met at Indianapolis, Indiana, October 19th. The available resources of the society for the year had been \$13,822, and its expenditures \$13,313. The missions were at Southampton, Chester, and Liverpool, England; Copenhagen, Denmark; Frederikshald, Norway; Paris, France; and Constantinople, Turkey; and returned 648 members, 159 additions during the year, 2,600 persons in the congregations, and 665 in Sunday-schools. The society decided to co-operate with the Christian Woman's Board of Missions in establishing a mission in Japan as soon as that should be judged practicable by the board of managers. The committee on "Present Missions" presented a report in favor of maintaining all the existing missions in foreign countries, making especial reference to those in Great Britain, which was adopted. The committee on the extension of foreign missions made a report deprecating the idea that the duty of the society was fulfilled by establishing and maintaining missions in Protestant Christian countries, indicating Japan and Africa as

suitable fields for further efforts, and recommending the appointment of traveling financial agents to procure subscriptions for the maintenance of the work of the society. This report was adopted.

The *Christian Woman's Board of Missions* has a mission in Jamaica, with 700 members, a school at Kingston, and day-schools, supports a teacher in France, and employs a missionary to the freedmen at Jackson, Mississippi.

The churches of the English missions, embracing congregations at Chester, Liverpool, and Southport, held a meeting at Helsby, August 1st, and took steps for the organization of a conference, "not for the exercise of legislative or ecclesiastical functions, but for the cultivation of personal religion, and the extension of the Redeemer's cause," to be held annually.

DISRAELI, BENJAMIN, Earl of Beaconsfield, twice Prime Minister of Great Britain, died in London, April 19th, at the age of seventy-six. The deceased statesman had suffered for several years from attacks of gout complicated with bronchitis, which at times reduced him to a condition of extreme weakness. The fatal attack seized him, while suffering from general ill health and in a season of exceedingly unfavorable weather, just a month before his death. In the medical treatment of his case, the question of the professional propriety of allopathic physicians consulting with Lord Beaconsfield's attendant, Dr. Kidd, who belonged to the homœopathic or the eclectic school, arose in the regular organization of medical practitioners. Dr. Quain, a physician of reputation, waived the rule of etiquette, and assumed the case jointly with Dr. Kidd, with the general approval of the profession.

Disraeli occupied a position so anomalous that even after the triumphs of his last premiership the sources of his influence and the secrets of the great power he wielded are scarcely understood even by the party which, under his leadership, controlled a vast majority of the suffrages of Great Britain. His character was mistrusted by the Tories themselves when they submissively followed his guidance in courses of which they had no foreknowledge, and which antagonized their own convictions. He brought others to forget their professions and abandon their principles; but in the extremest concessions which he made to the democracy he maintained with justice that he did not depart from the fundamental principles of politics which he had always avowed. Disraeli belonged to a school of political thinkers whose deeper perceptions have not been apprehended by a world dazzled by the philosophy of the French Revolution and of the industrial school of political economy. The older romantic statesmen belied their better inspiration in becoming mere reactionists, the sentimental or the interested champions of existing powers and menaced privileges. Disraeli was a Conservative by nature, but one who possessed the gift of looking before as well as after. He pro-

pounded to himself and to his political disciples in the beginning the question, "What is to be conserved?" and throughout his career he showed himself as radical in lopping off outworn institutions to which even his Liberal opponents still clung as he was conservative in upholding ancient and enduring social principles which were ignored in the Liberal philosophy. Disraeli's political ideal is unfolded in his novels "Coningsby" and "Sibyl." His intellectual method was not comprehended by an age and a nation educated only in the short and easy political logic of deduction from assumed universal axioms. The underlying motive of his speculations was the need which he felt of closer bonds of social interdependence, such as those which the great revolution had unloosed. Neither he nor the age was ripe for constructive developments in that direction even to commence. Disraeli was in advance of the time in recognizing the fatuity of the doctrine that unchecked selfishness is the main-spring of progress. He had the genius to discern the interior vitality of the ancient institutions, proclaimed effete, with which memories of social duties and hallowed relations were associated; and in revindicating the high mission of the throne, the national church, and the nobility, he struck a chord to which the feelings of the higher and the lower classes responded, and which did not leave the great middle class unaffected. Disraeli was a leading spirit in the movement of moral regeneration among the British aristocracy which occurred at the period when he was by hard parliamentary work gaining the reluctant reliance of the Tories upon his brilliant powers of debate and astute party tactics. The confidence and respect which, as a moral leader, he deserved of the Tory party, was tardily meted to him only on account of his political triumphs.

In the field of foreign politics, in which he won and lost his great battles, Disraeli's motives were of a lower order than his social doctrines, which he could not carry out in practical politics, but which actuated him to accept democratic measures; notably to take the "leap in the dark" which extended the franchise to the rural population. Disraeli's foreign policy, loudly as it has been condemned by doctrinaires, is the historical policy of Great Britain. To strengthen the imperial authority in India was a politic and exigent course. The domination of Great Britain by the exercise of military power over all the outlying weak and barbarous nations of the world is an immorality the blame for which attaches principally to the mercantile community. They have benefited by such exhibitions of tyranny, and are only brought to condemn them when the cost is not immediately returned to them in rich profits.

Disraeli's bold preparations for war with Russia, which enabled him to reassert England's authority in the councils of Europe, and to return in triumph from Berlin bringing "peace

with honor," was a course which, in spite of subsequent defeat and depreciation, still claims the praises of English patriots. The war with Afghanistan grew directly out of the policy taken toward Russia, and the Transvaal war out of a situation of affairs for which both parties were responsible. That both these wars might with more credit have been avoided was the verdict of the people in the elections of 1880. Disraeli's precipitation from power immediately after attaining the pinnacle of greatness was rather a manifestation of the jealous ingratitude of republics than a condemnation of his policy. The dramatic effect produced by springing his political strokes upon the country as surprises, and the outward pomp and vainglorious flourish of titles in his Oriental policy, were repugnant to the sober second thought of Anglo-Saxon people.

No Continental power was disposed to restrain Russia from acting her will with Turkey after the hard-won conquest. But all the neutral powers approved the spirited stand taken by England, although the English themselves, who had become thoroughly indoctrinated with the theory of non-intervention, acquiesced very reluctantly, until the slumbering martial passions were excited. The Russian version of the "Bulgarian atrocities" was eloquently presented to the country by Gladstone and other Liberal orators. Lord Derby and Lord Carnarvon resigned from the Cabinet. With the party thus crippled and public opinion wavering and turning against him, Disraeli courageously went forward in the course which he deemed necessary to take in order to rescue England's menaced Asiatic interests. A British fleet forced the Dardanelles and anchored before Constantinople. Six million pounds were voted by Parliament for military preparations, and a contingent of native troops from India was landed at Malta, as a signal that the resources of the new empire of India would be drawn upon to prevent the encroachments of Russia upon British possessions in Asia, or her approach toward the route of naval communications with India. Disraeli dictated to Russia the terms of the Treaty of Berlin, and defeated the pretensions of the Treaty of San Stefano. By placing Bosnia and Herzegovina under the domination of Austria, he interested another power in the prevention of Russian aggression beyond the Balkans. The acquisition of Cyprus by England was of doubtful advantage. Upon his return from Berlin he entered the House of Lords with the title of Earl of Beaconsfield. Upon the resignation of the Disraeli Cabinet in 1868 he had been tendered a peerage, but was unwilling at that time to retire from the House of Commons, and accepted the honor for his wife instead, upon whom was conferred the title of Viscountess Beaconsfield. The result of the elections of the spring of 1880 was a surprise to the victorious as well as to the defeated party. It was a bitter disappointment to Disraeli to see his cherished plans brought

to naught and his policy reversed. From his seat in the House of Lords during the remaining year of his life he did not often rise, but occasionally lifted his voice in indignant or sarcastic protest. The biographical details of Lord Beaconsfield's career have been related in an earlier volume (see DISRAELI, BENJAMIN, in "Annual Cyclopædia" for 1877).

DOMINION OF CANADA. Parliament, having been summoned in December, earlier than the usual time of assembling, in order to act upon the Pacific Railway contract to which the Government had pledged themselves, continued in session till March 18th. After the terms of the agreement were published, a company of Canadian capitalists offered to build and keep in operation the transcontinental railroad on terms more favorable to the Government. Their proposition was to fulfill the contract for a money subsidy \$3,000,000 less and a land subsidy 3,000,000 acres less than the syndicate with which the Government had contracted, and furthermore to submit to free competition from parallel lines and roads connecting with the United States railroads, and to forego the immunities granted to the syndicate from general and local taxes and duty on imported materials. They also offered to submit to expropriation at any time on terms to be settled by arbitration. The Liberals did not press for the acceptance of these terms, but argued that the Premier's bargain was materially poorer than the one offered by the Canadian syndicate, and that yet better terms might probably be obtained if competing bids were invited, while still contending that no contract for the completion of the entire line should be entered into at present. The Opposition gained no numerical strength during the session, remaining in a small but strenuous and formidable minority. Parliament was engaged over the contract with the St. Paul syndicate for the transfer of the portions built and the completion of the Pacific Railroad during the whole of January. Mr. Blake brought in, as an amendment to the bill, a proposition to disregard the Government's provisional bargain, and make the best terms for the Dominion which could be secured by competition in the open market. Upon the rejection of this proposition, the clauses of the contract one by one were made the subject of specific amendments. The Government, in view of its inconsistency with the national policy, altered the condition by which the syndicate were granted a special immunity from the duty on steel, and instead made steel duty free for the space of one year. On the 28th of January, in a sitting of seventeen hours, the Opposition offered eighteen amendments, which were all voted down. On the 31st the bill was passed at its third reading by a vote of 128 to 49.

The terms of the contract made provisionally by Sir John A. Macdonald with the St. Paul syndicate, after his failure to induce London capitalists to undertake the completion of

the Pacific Railway, are detailed in the "Annual Cyclopædia" for 1880. They were ratified in all essential particulars by the vote of Parliament. The company receive the sections of the road already completed and under way, the total cost of the property to be handed over to them by the Government being estimated at \$32,500,000. They receive in addition a money subsidy of \$25,000,000, and a land subsidy of 25,000,000 acres. The total subsidies allowed them for completing and running the road for the specified term of years are valued in the aggregate at \$107,500,000. The land they are allowed to select at will, along the line of the main or branch roads, or elsewhere in the unoccupied Northwest. The portions of the line to be constructed by the syndicate were estimated by Sandford Fleming, the former Government engineer, at \$48,500,000. The company are protected from competing parallel roads, and from other lines crossing the boundary, for twenty years. They are also granted immunity from taxation for ever, and are permitted to import all materials free of duty. The right of the Dominion Government to regulate freight and passenger rates is not to be exercised until the earnings on the capital exceed 10 per cent per annum. The company issued \$25,000,000 of bonds secured on their land grant, the amount for which they were allowed to bond the land by the terms of the charter. Of the total amount \$5,000,000 are retained by the Government until the year 1901 as security for the completion of the whole line, and its maintenance. The remaining \$20,000,000 they are allowed to sell for what they will bring, the proceeds to remain in the custody of the Government, and to be paid over to the company as each twenty-mile section is constructed.

The letters patent to the Canadian Pacific Railway Company were issued February 16th, and the requisite \$5,000,000 of stock were subscribed for, and the deposit with the Government of \$1,000,000 made immediately. The company was organized with George Stephen, of Montreal, as president; Duncan McIntyre, of Montreal, vice-president; J. J. C. Abbott, counsel; McIntyre, Angus, and Hill, executive committee; Charles Drinkwater, secretary and treasurer; and A. B. Stickney, general superintendent of the Western Division. The Government transferred the Pembina Branch and the completed portions of the Pacific Railway to the syndicate in the beginning of April. The company announced their intention of rapidly pushing the construction of both the eastern and western sections of the main line, and of building a branch line from a point near its eastern terminus to Sault Ste. Marie, and another from a point beyond Red River to the Souris coal-fields and the United States boundary. The latter project discourages the construction of an independent road from Winnipeg to the coal-mines, for which concessions had been obtained, and the other proposed

branch threatens competition with the line undertaken by the Ontario and Sault company. An amalgamation with the Canada Central and Intercolonial Railway, owned by the Government, was effected by the syndicate. The portions of the main line constructed are about 500 miles in Manitoba and 100 miles in British Columbia. The whole will be completed by the syndicate, it is expected, in about seven years. The entire line will be about 4,500 miles long, extending from Halifax to Burrard Inlet. Surveys have been made for a shorter route between Kamloops and Selkirk than over the Yellowhead Pass, the passage in the Rocky Mountains selected by the Government. It has been decided to construct two branch lines extending in a northwesterly direction from the main line, which will probably be deflected to the south in the Northwest Territory from the line surveyed by the Government engineers. One of the branches is to enter the main line at Brandon and one near the great forks of the Qu'Appelle.

The syndicate introduced regulations with regard to the sale of lands in the Northwest which are more inviting to settlers than those in force before. The price of land in the sections belonging to the company within the 24-mile belt was uniformly fixed at \$2.50 an acre, payable in seven annual installments with interest; but one half of the purchase-money payable within the first three years will be remitted to settlers who crop one eighth or more of an 80 or 160 acre tract, or 100 acres in a 320-acre tract, and a proportionate part of a 640-acre tract; and, when buildings of the value of \$1,000 or more are placed upon the property, the same rebate is continued for five years. The price of a quarter-section or half a quarter-section is thus reduced for the purchaser who tills the prescribed minimum, to \$2.03 an acre, not counting interest, and, if he puts up buildings of the stipulated value, to \$1.72 an acre. The Government have put the same price on the even-numbered sections, but allow no rebate, the right of the pre-emptor to a contiguous quarter-section under the homestead law constituting an equivalent. The Government land is open only to actual settlers. From the 1st of January, 1882, the pre-emption price is due in a single payment at the end of three years. Outside the 24-mile belt one half of the land is subject to homestead and pre-emption at the price of \$2 an acre, and the remainder is salable to any buyers and in any quantities at \$2 cash per acre. The European companies and individuals may purchase tracts of land within the 24-mile belt at \$1.25 an acre on the condition of colonizing them. The Government also reserve the power of granting tracts beyond the 24-mile belt to the Canada Pacific or other railroad companies at \$1 an acre, and of leasing to cattle-breeders for terms of twenty-one years tracts of 100,000 acres or less.

A memorandum of the Minister of Agricult-

ure, J. H. Pope, presenting a plan for the establishment of impoverished Irish tenant farmers upon unoccupied lands of the Dominion by the assistance of the Canadian and the Imperial Governments, was adopted by the Privy Council of the Dominion and transmitted to the Imperial Government in March. It proposed that provision be made for removing families from Ireland to the Northwest, and their maintenance until the first crop should be gathered from the land. By arrangement in advance, the farm-lots of the new-comers could be prepared, a small dwelling erected on each lot, and a portion of the farm broken up and prepared for seed before the arrival of the immigrant, and in the case of those sent late in the season actually sown, so as to insure a crop the same year that the immigrant is placed in possession. This work would afford employment to the immigrants upon their arrival and while their own crops are growing. The cost of settling immigrants on this plan was estimated at \$200 for transport of a family with three children to Winnipeg, and about the same sum for preparing for seed eight acres of prairie-land. The advances which should be made by the British Government for such purpose might be intrusted to a national emigration association; and the Canadian Government could provide that the cost of preparing homesteads for the occupation of settlers and the cost of transport should form a prior charge upon the land, payable in certain annual installments with interest. The Canadian Government has provided for placing tracts of land in the Northwest at the disposal of emigrant associations or commissions for settlement by families from the old country.

A bill for the extension of the boundaries of Manitoba was brought in the Senate by the ministry in March. It provides in the same manner as a bill which passed the Manitoba Legislature, for the enlargement of the province westward by the incorporation of the settlements up to the Assiniboin, and for the inclusion of the territory eastward up to the Ontario boundary-line. The eastern boundary thus defined may become a matter of controversy, since the western and northern boundaries of the Province of Ontario are in dispute between the Ontario and Dominion authorities.

In an alien act passed by Parliament, the principle was affirmed incidentally that the Dominion Parliament possesses concurrent powers with the Provincial Assemblies in legislation regarding property and civil rights.

The revenue for the year ending June 30th was \$29,712,063, derived from the following sources:

From customs.....	\$18,406,058 18
“ excise.....	5,344,861 14
“ other sources.....	5,961,644 65
Total.....	\$29,712,063 97

The expenditures amounted to \$25,579,168, leaving a surplus of \$4,132,895. The estimate

of expenditures for 1881-'82 submitted to Parliament by the Finance Minister, Sir Leonard Tilley, was \$26,465,000. In view of a probable large increase in the customs revenue, the Government has acceded to demands for larger local expenditures. The increase over the annual budgets presented by the late Government is about \$2,000,000.

The amendments made by Parliament in the tariff law during the session of 1881 were all in the direction of higher and more extended protection.

The protective tariff has not resulted, as its opponents predicted, in perpetuating the condition of depression and commercial inactivity. On the contrary, the material prosperity of Canada under the new tariff has been unexampled. Yet the most intelligent of both parties under-

stand that the development of trade and agriculture was not caused by the tariff. The tide was just turning when the new tariff laws went into operation. The opening up of fresh agricultural areas, the abundance of the crops, and the active demand in Europe for the produce, operated as in the United States to bring about and to sustain the upward movement. The high tariff went into force in March, 1879. Owing to the general prosperity, the total value of imports, though less, was still so large that the revenue from import duties was considerably augmented. The exports in the first year of the tariff exceeded the imports for the first time in the commercial history of the Dominion. The following table contains the returns of the exports and imports, and the duty collected for a series of years:

YEAR ENDING JUNE 30—	Total exports.	Total imports.	Entered for consumption.	Duty.
1868.....	\$57,567,889	\$73,459,644	\$71,955,306	\$3,519,431
1869.....	60,474,781	70,415,165	67,402,170	8,293,910
1870.....	78,578,490	74,814,839	71,237,603	9,468,940
1871.....	74,178,618	96,092,971	86,947,482	11,843,656
1872.....	82,639,663	111,430,527	107,709,116	18,045,494
1873.....	89,789,922	128,011,281	127,514,594	18,017,730
1874.....	89,351,923	123,218,582	127,404,169	14,421,883
1875.....	77,886,979	123,070,283	119,618,657	15,361,382
1876.....	80,966,435	93,210,346	94,733,218	12,533,114
1877.....	75,575,393	99,327,962	96,300,483	12,518,451
1878.....	79,323,667	93,081,787	91,199,577	12,795,693
1879.....	71,491,255	81,964,427	80,841,603	12,939,541
1880.....	87,911,458	86,459,747	71,732,349	14,138,849
Aggregate.....	\$1,001,026,477	\$1,259,582,061	\$1,214,176,332	\$159,527,074

The value of imports for the fiscal year 1881 attained the sum of \$105,330,724; the value of the imports entered for home consumption was \$91,619,434. The customs taxes collected amounted to \$18,778,146. The total exports, including, as in the above table, specie and foreign merchandise, were \$92,026,527. There was thus an excess of imports over exports of \$13,304,197, and an increase over the exports of the preceding year of \$4,115,069.

The tariff completely fulfilled the design of its constructors of discriminating against the products of the United States, and in favor of the manufactures of Great Britain. If intended as a temporary retaliatory measure, its very success must greatly increase the difficulty of returning to reciprocity with the United States. Various industries have been created on the strength of the exclusion of American goods, and are already in extensive operation. The agitation in England in favor of protection and reciprocity, and of a protective league between the mother-country and the colonies, for the exclusion of the products of all other nations, lends vigor to the new policy in Canada. The farming class have not accepted the tariff with entire satisfaction. They are pressing in their demands to have the agricultural interests aided and protected wherever it is possible to lay an import duty, and even to have the excise duties remitted in their favor. A duty upon wool and an increase in the grain duties are strongly agitated. For beet-sugar an immunity

from the excise duty for eight years is demanded. The tobacco-raisers ask for an import duty on tobacco, and a removal of the excise duty on their product.

Before the change in the tariff the imports from the United States had for several years exceeded those from Great Britain. In the first year the imports from the United Kingdom increased in value, while those from the United States fell off so greatly as to be \$5,000,000 less than the British imports, whereas the year before they had been \$13,000,000 greater, and had exceeded them every year since 1874. In 1874-'75 the importations into the Dominion were from Great Britain, \$60,000,000; from the United States, \$50,000,000; from other countries, \$8,000,000. In 1875-'76 the figures were: from Great Britain, \$40,000,000; from the United States, \$46,000,000; from other countries, \$5,000,000. In 1877-'78: from Great Britain, \$37,000,000; the United States, \$46,000,000; other countries, \$5,000,000. In 1878-'79: Great Britain, \$30,000,000; United States, \$43,000,000; other countries, \$5,000,000. In 1879-'80: Great Britain, \$34,000,000; United States, \$29,000,000; other countries, \$7,000,000. In 1878 the value of American goods which were entered for consumption was \$48,631,739, on which duties were paid to the amount of \$4,794,599, or about 9½ per cent. In 1880 the value of imports entered for consumption from the United States was \$29,346,948, which realized \$4,521,-

311 in duties, or nearly 15½ per cent. The duties collected on British imports in 1879 amounted to \$6,445,985 on \$37,431,180, being less than 17½ per cent. In 1880 the goods entered for consumption from Great Britain decreased to \$34,461,224, but the duty collected was \$6,737,997, averaging over 19½ per cent. The average percentage of duty on the values imported was in 1877 12·63 per cent, 13·74 per cent in 1878, 15·78 per cent in 1879, and in 1880 16·34 per cent. The duty per head of population in 1868 was \$2.62. In 1879 the duties collected were \$3.10 per capita; in 1880 they were \$3.31 per capita, and in 1881 \$4.32.

The exports of mining products decreased from \$3,187,722 in 1879 to \$2,981,613 in 1880; produce of fisheries from \$7,072,203 to \$6,663,347; forest products were exported to the amount of \$17,666,693, against \$13,797,259 in 1879; the class of miscellaneous articles to the amount of \$759,196, against \$450,997. The exports of animals and animal products increased from \$14,737,393 in 1879 to \$18,504,000 in 1880; those of agricultural produce from \$25,970,887 to \$32,287,128. The total exports of products of the soil thus increased from \$40,708,280 to \$50,791,128, or 25 per cent. The Canadian imports of manufactures at the same time increased from \$81,964,427 in 1879, to \$85,489,747 in 1880. The exports of manufactures were \$4,715,776 in 1878, \$3,228,761 in 1879, and \$4,484,211 in 1880, showing an increase under the new tariff of \$1,255,450. But of this increase only \$542,336 represents Canadian products, and these mainly partly manufactured articles. The duties on the raw materials and the implements of manufacturers, and the increased cost of production owing to the higher cost of living, transportation, etc., worked by the tariff, have had the effect of diminishing the exportation of many of the more finished articles of Canadian manufacture. Thus the exports of agricultural implements, carriages, clothing, cordage, boots and shoes, spirits, sewing-machines, machinery, woollens, oil-cake, and other articles fell away, and some of them very heavily. The ship-building industry seems to have suffered most from the tariff. The tonnage of vessels built declined from 106,976 tons in 1878 and 103,551 tons in 1879 to 68,756 tons in 1880. The number of tons registered fell off from 100,089 in 1878 and 94,882 in 1879, to 64,962 in 1880. The value of ships sold to foreigners decreased from \$1,236,146 in 1878, to \$464,327 in 1880.

The imports into the Canadian Dominion and Newfoundland of the following classes of British manufactures are valued in the British trade returns for the first year of the new tariff compared with the preceding year as follows:

BRITISH EXPORTS TO CANADA.	1879.	1880.
Wearing apparel.....	£390,590	£918,954
Cotton goods.....	521,600	665,800
Hardware.....	110,730	150,004
Woollens.....	842,490	509,748
Worsted.....	835,596	447,847

The exports of Canadian products, with coin and bullion exports added, amounted to \$78,638,089 in 1880-'81, as compared with \$74,671,452 in 1879-'80, \$63,136,611 in 1878-'79, and \$80,384,012 in 1872-'73, the year of largest exportation. The classification of the exports of the year is as follows:

CLASS OF EXPORTS.	Produce of Canada.	Produce of other countries.	Total exports.
Produce of the mine.....	\$1,464,186	\$154,026	\$1,618,162
Produce of fisheries.....	6,465,566	28,988	6,494,549
Produce of forests.....	24,774,744	772,281	25,547,025
Animals and their produce.....	21,007,711	1,806,118	22,813,824
Agricult. products.....	21,252,490	10,053,628	31,306,118
Manufactures.....	8,039,266	925,580	8,964,796
Miscellaneous.....	684,176	138,577	770,053
Total.....	\$78,638,089	\$18,888,498	\$92,026,527

The shipments of lumber from the St. Lawrence show a material decline in 1880-'81 as compared with the previous year's exports. The total exports of square timber from Quebec and the lower St. Lawrence amounted to 337,086 tons, against 434,103 tons in 1879-'80, a decline of over 22 per cent. The decrease was distributed over all kinds of lumber, but was most marked in the export of white pine. There was a still greater decline in the grain export trade, amounting to 33·8 per cent. The grain-shipments from Montreal fell from 22,194,054 to 14,671,308 bushels. The wheat export was 6,421,096 bushels, against 9,239,701 in 1880; the corn export 3,334,078, against 7,303,979 bushels; peas were exported to the amount of 3,111,583 bushels, showing a slight gain; oats to the amount of 1,211,221 bushels; barley, 133,659 bushels; rye, 459,666 bushels. The shipments of flour were 618,114 barrels.

The present supply of beef is hardly sufficient to maintain the new and flourishing meat-exporting trade in the dimensions which it has attained. Owing to this outlet for the surplus product, the price of beef rose in Toronto to sixteen cents a pound, and exporters in 1881 experienced much difficulty in obtaining carcasses. The supply from Canada must, therefore, be small for some time to come, and may cease unless prices remain high in England.

The crops of grain averaged better in the Dominion in 1881 than in the United States. The opening up of a large extent of new country in the last few years has provided an abundance of work for the whole Canadian population since the revival of business. Wages have risen to prices which even attract labor from the United States. The lumber industry is seriously affected by the dearth of laborers. In Ontario farmers have been unable to find hands at \$2.25 a day. On the new railroads in Newfoundland \$1.50 a day was paid to laborers.

The lobster-canning industry on Prince Edward Island has been carried on but four years; yet the lobsters have been consumed in such quantities that they are fast giving out.

Stringent regulations have been put in force to preserve them, but they have been ineffectual to stay the falling off. These limit the fishing season to eighty days in the year, and prohibit the capture of lobsters under eight inches in length. The product of the lobster-fisheries in 1880 was 2,000,000 cans.

The exports of coal from the Nova Scotia mines have not increased in the last three years. The number of tons exported are given in the trade returns as 185,448 in 1877-'78, 134,017 in 1878-'79, and 132,796 in 1879-'80. The exports from British Columbia for the same years show a progressive increase, having been 145,542 tons in 1877-'78, 173,789 in 1878-'79, and 204,525 in 1879-'80. The prices at which the British Columbian coal is exported are much higher than those paid for the Nova Scotian product, the value of the exports from the former province in 1879-'80 being given as \$700,142, and that of the latter's exports for the year as \$238,390.

The rate of interest in Canada twenty years ago ranged all the way from 10 to 20 per cent per annum. Down to 1876, 9 per cent was always procurable on mortgages. In 1877 the usual rate came to be $8\frac{1}{2}$ or 8 per cent. In the winter of 1880-'81 the demand for loans on first-class property grew less, and money at the same time more plentiful, so that the prevailing rate sank to 7 per cent and even lower. Banks have ceased to pay interest on deposits. Good township or county loans can be placed at 6 per cent, and the 5 per cent Dominion bonds have risen above par.

From the statistics of crime for the year 1879 it appears that the convictions for crimes against the person were 3,084 in Ontario, being one in 520 inhabitants according to the census of 1871; 1,070, or one in 1,114 inhabitants, in Quebec; 270 in Nova Scotia, or one in 1,390; and 260 in New Brunswick, or one in 1,098. The larger ratio in Ontario is owing to the greater number of foreign-born inhabitants in that province, since the number of convictions among the native-born were only 676, against 668 in Quebec, and 183 in New Brunswick. Of 10 persons tried for murder in Ontario 4 were acquitted, while out of 18 persons brought to trial in Quebec 16 were acquitted. The convictions for crimes of persons reported as well-educated in the Dominion were not more than one seventh as numerous as among the class of the totally illiterate. Out of 2,590 criminals convicted of the graver offenses against the person and against property, 1,106 were married, 42 widowed, and 1,452 single. Out of 1,670 convicts, 902 were set down as moderate drinkers and 768 as intemperate.

The prohibition movement in Canada is gaining in force annually, and there are signs of a strong and wide-spread agitation in immediate prospect. The Scott Permissive Act has been adopted in a number of counties, and the results attained are prompting others to take advantage of it for the suppression of intemper-

ance. Steps have been taken for a vote in some of the cities on the application of this act. The act was passed in 1878. The next year it was tested in the courts, and declared to be unconstitutional by the Supreme Court of New Brunswick. The Government assumed the case, and carried it into the Supreme Court of Appeals of the Dominion, which reversed the decision and declared the Canada Temperance Act to have been within the constitutional powers of Parliament. The liquor interest did not let it rest there, but carried the question before the Judicial Committee of the Privy Council of Great Britain, which tribunal has not yet passed upon the case. The Dominion Government have not taken steps to defend the act before the Privy Council. The Scott act has been adopted by five sixths of the counties and cities of Canada.

The military spirit, as evinced in the training and parading of militia corps, has been more rife of late in Canada than in former years. The active militia of the Dominion are reported as 37,576 men, of which Ontario has 16,801, Quebec 12,251, New Brunswick 2,590, Nova Scotia 3,946, Manitoba and Northwest Territories 576, British Columbia 303, and Prince Edward Island 712.

The report of the Post-Office Savings-Bank for the fiscal year 1881 shows a great growth in the popularity of the institution. The deposits were \$4,175,042, being nearly double those of any previous year, while the withdrawals were \$2,072,289, but little above the usual amount. At the close of the year there were 39,605 accounts open, representing \$6,208,226.77, or an average of \$156.75 per account. This average is higher than it has ever been before. The nearest approach to it was \$147.04 in 1872. The interest paid out to depositors in the year was \$184,904.81. The total sum received by the bank since its establishment in 1868 is \$27,097,124, the total amount withdrawn \$19,852,043, and the sum invested at depositors' request in Dominion stock, \$2,431,900. The bank continues to pay 4 per cent interest on deposits, while many of the loan societies have reduced their rate to 3 per cent. This fact, and the increased prosperity of the people, account for the increase in the bank's business.

The extent of the emigration to the United States has been the subject of many questions and comments. The accuracy of the returns of immigration made by the United States customs officers, especially at Port Huron, as indicating the actual extent of the settlement of Canadians in the United States, has been doubted, perhaps not without reason. The Canadian Government instituted an investigation into the movement. The officers of the railroad companies were questioned regarding the number of tickets sold, which, though affording results more agreeable to their wishes, was a still less reliable statistical method. The census returns did not afford the data for solv-

ing the problem, owing to the custom of enumerating the *de jure* citizens in the Province of Quebec, whence the migration has been strongest, although they may be residing out of the country. A pamphlet by Mr. Lowe, published by the Government, attempts to show that the counter-movement of migration from the United States into Canada was about 90,000 greater in number in the decade 1871-'81 than in the previous decade. The United States returns of immigration from Canada since 1873 are as follows:

FISCAL YEAR.	Number of Immigrants.
1873.....	87,871
1874.....	82,960
1875.....	24,051
1876.....	22,471
1877.....	22,116
1878.....	25,568
1879.....	81,268
1880.....	90,706
1881.....	118,664

The *de jure* method of enumeration pursued in Quebec affects the relative representation of the provinces. According to the British North America act, Quebec shall be represented in the Dominion Parliament by 65 members, and the other provinces by numbers which bear the same ratio to their population as that number to the population of Quebec. The representation of the different provinces, as determined by the census, will be as follows: Quebec, 65; Ontario, 92; New Brunswick, 15; Nova Scotia, 21; Prince Edward Island, 6; Manitoba, 4; British Columbia, 6. As compared with the last apportionment, Ontario has gained four members, while the remaining provinces have the same number of representatives. If the same rate of increase prevailed in Quebec which took place between 1861 and 1871, the other provinces would have nine more members than the present census gives them.

According to the census returns, the population of the several provinces, as compared with the census made at each preceding decade since confederation, is as follows:

PROVINCE.	1861.	1871.	1881.
Ontario.....	1,896,091	1,620,851	1,913,460
Quebec.....	1,111,566	1,191,516	1,858,469
Nova Scotia.....	330,857	387,800	440,585
New Brunswick.....	252,047	255,934	321,129
Prince Edward Island.....	60,837	94,021	107,751
Manitoba.....	12,223	49,509
British Columbia.....	33,586	60,000
Territories.....	60,500	100,000

In this enumeration the population of the Territories and unorganized districts is merely estimated.

The total population of the Dominion is 4,350,933, an increase upon the census of 1871 of 664,337, the total population then having been 3,786,596. The percentage of increase of population during the decade for each province and for the whole Dominion was as follows: Ontario, 18·05 per cent; Quebec, 14·01; Nova Scotia, 13·61; New Brunswick, 12·44; Prince Edward Island, 14·63; Manitoba, 28·90; British Columbia, 76·66; Territories, 65·28;

the whole Dominion, 18·02. The average rate of growth in the Maritime Provinces was 13·56, while that of the New England States was only 10·80. Ontario's increase was at nearly the same rate as that of Indiana and Ohio.

The population of the chief cities of the Dominion, compared with the previous enumerations, and the increase during the last decade, are as follows:

CITY.	1861.	1871.	1881.	Increase.
Montreal.....	90,323	107,225	140,682	83,457
Toronto.....	44,821	56,092	86,445	80,853
Quebec.....	59,990	59,699	62,447	2,743
Halifax.....	25,026	29,582	36,102	6,250
St. John, N. B.....	27,317	25,805	26,128	* 2,677
Hamilton.....	19,096	26,716	35,965	9,249
Ottawa.....	14,669	21,545	27,417	5,872
London.....	11,575	15,826	19,768	3,937
Kingston.....	13,743	12,407	14,693	1,686

Toronto, with its suburbs, has a population of about 100,000, showing a higher rate of increase than any of the older cities of the United States or Canada, except Brooklyn. Of the smaller towns, Levis, in Quebec Province, has fallen off in population from 11,810 to 7,697; Three Rivers has grown from 8,414 to 9,296; Sherbrooke City from 4,432 to 7,227; the newly incorporated Hull City contains 6,668 inhabitants; Sorel contains 5,792, showing a small increase; and St. Hyacinthe has increased from 3,746 to 5,321. In the Province of Ontario, Guelph City has increased from 6,878 to 9,890; St. Catharines from 7,864 to 9,642; Brantford City from 8,107 to 9,626; Belleville City from 7,305 to 9,516; St. Thomas City from 2,197 to 3,370; Stratford from 4,313 to 8,240; Chatham from 5,873 to 7,881; Brockville from 5,102 to 7,608; Peterborough from 2,293 to 6,815; Windsor from 4,253 to 6,567. Woodstock contains 5,373 inhabitants; Galt, 5,189; Lindsay, 5,081.

A steamboat accident occurred on the Thames River, at London, Ontario, May 24th, by which nearly 200 lives were lost. An excursion-boat, named the Victoria, when returning to the city with nearly 600 passengers on board, suddenly collapsed from the excessive load. The boat was weighted down by about half as many more passengers than it was allowed by law to carry, and water was flowing into the hold. A lurch to one side caused the slight stanchions supporting the upper deck to break, and the structure, with the superincumbent mass of people, sank upon those below. At the same time the vessel sank over upon its side, and the entire hull crashed together. It is probable that the boiler was insecurely fastened, and carried the boat over by slipping from its seat. The water was not very deep, but the passengers were plunged into the river upon one another, many injured by the falling timbers, and many more crushed under the wreck. The catastrophe served as a warning, which aroused the officials charged with the inspection of excursion-boats in the United States as well as

* Decrease.

in Canada to the more careful discharge of their duties.

One of the periodical conflagrations to which the wooden-built city of Quebec is liable occurred June 8th, destroying a great part of the suburb of St. John. Nearly 700 buildings were destroyed, among them the fine church of St. John. The pecuniary damage amounted to nearly \$2,000,000. The burned houses were the homes of some 9,000 people.

The Ontario Parliament closed its session March 4th. Several railway projects were chartered and subsidies granted, the chief of the railway bills being the one providing for the Sault Ste. Marie line. The principal act of general legislation was an act consolidating the superior courts of law and equity, and establishing a uniform system of pleading and practice. Important amendments were made in the license, municipal, and education laws. An act was passed to secure better protection of employes and the public against railroad accidents, and one to prevent the deterioration of rivers and streams through negligence in lumbering operations. The Liberal majority in the Assembly continued unbroken. The railway subsidies granted, it is expected, will speedily return to the Treasury in the form of increased revenue from crown lands and timber, resulting from the opening up of the country north of the Georgian Bay by the Sault Railway. A feeling was evinced against the subsidizing of further routes by the province, unless they promise advantages of the same exceptional character. Resolutions were passed in condemnation of the Dominion Government for its tardiness in adjusting the northern and western boundaries of the province, in accordance with the award which was made in 1878. An act was passed to give increased efficiency to mutual-insurance companies of the province.

The act to preserve the public interest in streams was disallowed on a petition to the Governor-General in Council, the reasons given being that it contravened a decision of a court of competent jurisdiction by affirming a public right where the court denied that there was one, that it took away proprietary rights without providing for compensation to the owner, and that it was retroactive in its operation. The Governor-General in Council is empowered, under the British North America act, to disallow provincial laws, not only because they are *ultra vires*, but if they are deemed an abuse of the legislative power within the sphere of provincial legislation. The disallowed act provided that all persons might use slides, dams, gates, booms, and works of excavation for floating timber, upon the payment of a reasonable toll to the owners of the improvements.

The Judicature Act was drawn up on the model of the act for the same purpose passed seven years before by the British Parliament. The Courts of Chancery and Common Pleas and the Queen's Bench were consolidated into a High Court of Justice. The distinction be-

tween the rules of law and equity is abolished, and where they differ the rules of equity are to guide the court. Proceedings in chancery by a bill or information give place to the common-law writ. Technical pleading is done away with, and a plain statement in ordinary language is sufficient.

The total expenditures of Ontario in 1880 amounted to \$2,243,663, of which \$173,732 went for the expenses of the civil government, \$111,585 for legislative expenses, \$265,070 for the administration of justice, \$505,104 for education, \$505,598 for the maintenance of public institutions, \$141,361 for public works, \$52,982 for immigration, \$107,282 for agriculture, arts, and literary institutions, \$72,832 for hospitals and charities, \$91,293 for miscellaneous expenses, \$26,375 for public works, \$96,839 for colonization roads, \$59,046 for crown lands, and \$34,558 refunded. The revenue for 1880 was \$2,451,935. It was made up principally by a subsidy of \$1,116,872; a specific grant of \$80,000; interest on special funds, \$136,696; crown-lands revenue, \$616,311; revenue from public institutions, \$63,982; from education, \$44,284; interest on investments, \$101,812; licenses, \$91,207; law-stamps, \$66,984. The assets of the province, consisting of investments, trust-funds held by the Dominion, deposits in bank, etc., amounted to \$5,040,487, the liabilities to \$820,398, leaving a surplus over and above all indebtedness of \$4,220,088. The estimated expenditures for 1881 were \$2,034,823 for current expenses, \$228,691 for public works charged to capital account, and \$45,677 for other purposes; together, \$2,309,191. The estimate of receipts was \$2,400,169.

An inquiry as to the aggregate indebtedness of municipalities in Ontario shows that it is altogether about \$22,000,000. The principal objects for which the loans were raised were railway aid, which took about \$8,400,000 of the proceeds of the loans; water-works and protection against fire, on which over \$4,750,000 were expended; drainage and sewerage, \$2,000,000; roads and bridges, \$1,800,000; school-buildings, about \$1,500,000; public buildings, \$1,000,000; aid to manufacturers, \$200,000. The municipal taxes for the year 1879 aggregated \$7,872,461, being at a rate somewhat less than one cent on the dollar, the assessed valuation of the province amounting to \$787,000,000 on a basis which would make the actual value of all property about \$1,200,000,000. The municipal expenditures of the province aggregated in 1879 \$11,137,747, of which \$2,630,958 went for schools, \$1,189,143 for roads, bridges, and sidewalks, and \$651,967 for the administration of justice. Municipal administration cost \$993,361.

The Province of Quebec is embarrassed by a debt of about \$17,000,000, the interest and sinking fund for which absorb about \$1,000,000 of the provincial revenues each year. No less than \$12,000,000 represent the cost of the

North Shore Railway, which under government management yields but \$70,000 a year. It is proposed to sell the road to the Canada Pacific syndicate, who, it is estimated, could earn from it as a branch of the Pacific Railway as much as \$500,000 a year, and would be willing to pay for the property \$8,000,000.

A special session of the Manitoba Legislature, called to take action on the boundary extension as soon as the Dominion Parliament should pass a law on the subject, opened March 3d. Manitoba, when it was created a province of the Dominion, was allowed the sum of \$551,447 as an offset to the debts of the other provinces assumed by the Dominion. The expensive system of government set up brought the "Prairie Province" into financial straits. The government was subsequently simplified by the abolition of the Upper Legislative Chamber and the reduction of the number of salaried ministers. Nevertheless, the capital in the hands of the Dominion Government, which allowed five per cent per annum interest, has been consumed to meet current expenses, until there only remains of it the sum of \$243,060. There were withdrawn from the fund in this way \$158,486 between 1872 and 1875, and in 1880 the additional sum of \$100,000 was taken to supply a deficit. The annual subsidies from the Dominion Treasury amount to about \$100,000, being made up of the annual interest on the remainder of the indemnity fund, \$12,153, a specific grant of \$30,000, and 80 cents per head of the population. The revenue collected by the province from taxation does not exceed \$15,000. The total amount available for the current provincial expenses is therefore only about \$115,000 a year. The expenses amounted in 1880 to \$181,320, and in 1881 were expected to be as great, or somewhat greater, on account of the extension of territory.

The agricultural capabilities of British Columbia are of an inferior order, but its mineral resources are probably very rich, and its timber undoubtedly of great value. Professor G. Dawson, of the Geological Survey, states that 110,000,000 acres, two thirds of the total area of the province, including Vancouver and Charlotte Islands, are covered with timber. The most valuable wood is the Douglas fir or Oregon pine. This esteemed commercial tree is found throughout Vancouver Island, adjacent to the 49th parallel of latitude, from the coast to and along the eastern slope of the Rocky Mountains; near and about Fort George; northeastward as far as McLeod's Lake, at Jaela Lake, at Babine Lake, and in many other localities. This tree frequently exceeds 8 feet in diameter above the ground, and grows to a height of from 200 to 300 feet, forming great and dark forests. Masts for export are hewed octagonally from 20 to 32 inches diameter, and 60 to 120 feet long. Yards are hewed of 12 to 24 inches diameter, and 50 to 102 feet long.

The Western hemlock, which grows much larger than the hemlock of the Eastern prov-

inces, is also found everywhere throughout the region of abundant rain-fall, being particularly fine and large in the Charlotte Islands. The other most important tree of the province is the red cedar, which grows there to a prodigious size. From Puget Sound about 150,000,000 feet of timber a year are shipped to California, 25,000,000 feet are sent to foreign countries, and 25,000,000 feet used at home.

In presenting the budget to the Columbia Legislature, Mr. Beaver complained that the Dominion would not assist the province by legislation to collect from the Chinese some contribution to the taxes. The Indians and the Chinese escape taxation altogether, and pay nothing for the support of the provincial government, but contribute to the expenses of the Dominion Government the duties on the imported and excise articles which they consume.

The revenue of Newfoundland for 1880 was \$928,565, a decrease of over \$60,000 as compared with 1879. This decrease was owing to smaller importations of molasses, sugar, spirits, wines, and tobacco. There is a floating debt of \$77,825. The estimated requirements for 1881 were \$989,860. The total expenditures were \$1,105,490. The consolidated and debenture debt of the province on January 1, 1881, amounted to \$1,450,990; but in the early part of the year \$100,000 of this was discharged. The ship-building of 1880 was 132 vessels, of 4,998 tons; the total shipping owned in the colony is 1,830 vessels, of 86,561 tons. The imports for the year 1880 were \$6,966,243 in value, or \$38.33 per capita; the exports, \$6,784,883, or \$37.33 per capita.

DUFAYRE, JULES ARMAND STANISLAS, French ex-Minister, died at Paris, June 27th, aged eighty-three years. Dufayre was the last survivor of the illustrious group of statesmen who came to the front in the reign of Louis Philippe. Free from vanity and ambitious intrigue, he was one of the most trusted and esteemed of French politicians, and in every political crisis for the last forty years he exercised a quiet influence not inferior to that of the more conspicuous actors. Less of a theorist than the other statesmen of his school, which formed its ideas on the model of English constitutionalism, he understood better the capabilities and tendencies of France, and he did more than the others by his efforts as a practical politician and by his own example to implant constitutional principles in France, and to lay the foundations for the secure establishment of the republic. Dufayre was born December 4, 1798, at Saujon, in the department of the Charente-Inférieure. He immediately took a high position at the bar upon completing his legal studies at Paris. He entered political life in the early part of the reign of Louis Philippe, being elected deputy in 1834 for Nantes, which city returned him regularly, except during the empire, from which he held aloof, until 1878. He was appointed a mem-

ber of the Council of State in 1836, but resigned in the following year and became one of the most active of the Opposition members. In May, 1839, he entered the Passy-Villemain Cabinet as Minister of Public Works. The Thiers Cabinet succeeded, the following year, which was followed by that of Guizot, in which Dufaure refused a place, and joined the Opposition, although most of his colleagues remained in office. He opposed the fortification of Paris and the compact with England regarding the right of search, over which was raised a cry against "perfidious Albion." He spoke in favor of the expropriation law, and in 1842 advocated the railway law. He became the leader of the famous "third party," which many of the chief liberals joined. After the Revolution of February Dufaure declared himself in favor of the republic, and took part in the Constituent Assembly as one of the leaders of the Moderate Democracy. Cavaignac called him to his Cabinet, October 13, 1848, as Minister of the Interior, and he had the direction of the official preparations for the election of a president of the republic. He favored the candidature of Cavaignac as being "a man and not an empty name." On December 20th he resigned from the ministry and resumed his seat in the Constituent and in the Legislative Assembly. On June 2, 1849, Louis Napoleon offered him the portfolio of the Interior again, which he accepted from patriotic motives, without ceasing to denounce the National Guards and the political meetings. He was dismissed October 31st, and took his stand as one of the most vigorous opponents of the personal politics of Louis Napoleon, of the revision of the Constitution, and of illegal re-election of the President. After the *coup d'état* he resumed practice at the Paris bar. After the German War and the fall of the second empire he was again elected a deputy from the department of Charente-Inférieure, and was chosen Minister of Justice under Thiers, and then became Vice-President of the Council. On May 19, 1873, he resigned office, and took a stand as leader of the Left Center against prolonging the extraordinary powers intrusted to MacMahon, and in favor of the adoption as a whole of the constitutional laws. He entered the Buffet Cabinet as Minister of Justice, and through this impolitic step lost his election as candidate for the Senate in January, 1876. He was then elected a deputy, and on March 9th was chosen President of the Council. He entered the Senate after the death of Casimir Perier. Dufaure by his shrewd and determined course contributed materially to the fall of MacMahon and the election of Grévy to the presidency. Dufaure was a minister in seven different cabinets and under five different rulers. He never enjoyed any great measure of popularity. He was too often in the Opposition and too rigid in his principles to win

popular admiration. He never courted it, nor planned combinations to secure his own advancement, nor connived in any of the acts of illegality or usurpation which have marked the course of French history in the nineteenth century. He was the obstinate defender of the principle of legality at every juncture, but refused his services to no government so long as it kept within the strict limits of what he considered constitutional action. Always following patriotic aims with single-minded purpose, he was a shrewd and crafty political tactician. As an orator, in the tribune or at the bar, he was remarkably clear and forcible in his statements, and was counted one of the most effective speakers, although his delivery was not attractive, and his speeches were devoid of wit or passion, but did not lack biting sarcasms on occasion. As a minister in the various departments which he filled he displayed the highest order of practical ability and judgment. The French railway system was developed according to his plans. Throughout his public life, even to the day of his death in extreme old age, Dufaure's counsels had more weight in critical junctures of public affairs than those of almost any of his contemporaries, and more than one grave national disaster was averted through his wisdom.

DYNAMITE MANUFACTURE. The French Academy of Sciences has recently awarded a prize of twenty-five hundred francs to Messrs. Boutmy and Foucher for introducing new modes of producing nitro-glycerine in quantity, by means of which the manufacture of dynamite has been rendered much safer than heretofore. The old method, in which fuming nitric acid, or a mixture of that substance and sulphuric acid, was made to act on glycerine, and the mass was suddenly immersed in water, often resulted in the production of enough heat to decompose a part of the nitro-glycerine and occasion a violent explosion in spite of the best refrigerating processes that could be employed. The principle of the new process, for which the prize has been conferred, consists in obviating the greater part of the heat by first engaging the glycerine in a combination with sulphuric acid, which forms a sulpho-glyceric acid, and then destroying this compound slowly, by means of nitric acid. Two liquors are prepared in advance—a sulpho-glyceric and a sulpho-nitric liquor, the latter with equal weights of sulphuric and nitric acids. These disengage a considerable amount of heat; they are allowed to cool, and are then combined in such proportions that the reaction takes place slowly. In the old method the nitro-glycerine is separated almost instantaneously, and rises in part to the surface, rendering washing difficult; in the new method it forms in about twenty hours, with a regularity which prevents danger, and goes to the bottom of the vessel, so that it can be washed rapidly.

E

EARTH-WORMS. The important part played by earth-worms in the formation of vegetable mold has been made the subject of a special memoir by Charles Darwin. These articulates are distributed all over the world, being found in the loneliest islands of the sea, even in Kerguelen Land. There are but few genera of earth-worms, and they closely resemble each other. *Lumbricus* is the name of the best-known genus. The species have not been accurately distinguished and numbered; but only a part of them bring up earth in the form of castings, and are engaged in making tillable soil. They appear to be found wherever there is moist earth containing vegetable matter, but seem to abound most where the ground is loose and well charged with humus. Dryness is unfavorable and even fatal to them; but, although

FIG. 1.—DIAGRAM OF THE ALIMENTARY CANAL OF AN EARTH-WORM (*Lumbricus*), (copied from Ray Lankester in "Quarterly Journal of Microscopical Society," vol. xv, new series, pl. vii).

and is endowed with a well-developed muscular system. The mouth is provided with a little projection or lip, capable of taking hold of

they are terrestrial animals, they have been found by M. Perrier to be capable of living for a considerable time under water. During the summer, when the ground is dry, and during the winter, when it is frozen, they penetrate to a considerable depth in the earth and cease to work. They are nocturnal in their habits, and may often be seen at night, crawling over the ground, more often moving their heads and bodies around while their tails are still inserted in their burrows. Only sickly worms, such as are afflicted by the parasitic larva of a fly, as a rule travel in the day-time; and those which are seen dead on the ground after heavy rains are supposed to have been creatures afflicted in some way that have died of weakness rather than by drowning.

The body of a large worm consists of one or two hundred almost cylindrical rings or segments, each furnished with minute bristles,

things, and of sucking. Internally, a strong pharynx, corresponding, according to Perrier, with the protrusile trunk or proboscis of other annelids, and which is pushed forward when the animal eats, is situated behind the mouth. The pharynx leads into the oesophagus, on each side of the lower part of which are three pairs of large glands, which secrete a surprising amount of carbonate of lime. They are unlike anything that is known in any other animal, and their use is largely a matter of speculation. They are probably partly excretions of the excess of lime contained in the leaves which the animal eats, and may otherwise aid digestion by affording a neutralizing agent against the acids of its food. In most of the species the oesophagus is enlarged into a cup in front of the gizzard. The latter organ is lined with a smooth, thick, chitinous membrane, and is surrounded by weak longitudinal but powerful transverse muscles. Grains of sand and small stones, from one twentieth to a little more than one tenth of an inch in diameter, may be found in the gizzard and intestines, and are supposed to serve, like millstones, to triturate the food. The gizzard opens into the intestine, which presents a peculiar remarkable longitudinal involution of the walls, by which an extensive absorbent surface is gained. The circulatory system is well developed. Breathing is performed through the skin, without special respiratory organs. The nervous system is fairly developed, with two almost confluent cerebral ganglia situated near the anterior end.

Worms have no eyes, and are measurably indifferent to light; yet they can distinguish night from day, and are quickly affected by a strong light, and after some time by a moderate light shining continuously upon them. They do not much mind a moderate radiant heat, but are sensitive to cold. They have no sense of hearing, but are extremely sensitive to vibrations in any solid object. Worms in pots, which had paid no attention to the sound of a piano, when placed on the piano instantly drew into their holes when the notes were struck. Their whole body is sensitive to contact, as of a puff of air. Their sense of smell is feeble, but responds fairly well to the odor of the cabbage and onion or whatever they like. They are omnivorous, and swallow enormous quantities of earth, out of which they extract any digestible matter which it may contain; they also consume decayed and fresh leaves and vegetable matter, and raw, roasted, and decayed meat, but like raw fat best.

Mr. Darwin discovered in worms evidences of a degree of intelligence. They line their burrows with leaves as a protection, it is supposed, against the cold of the clammy ground, and plug the entrances to them with leaves

and leaf-stalks. It requires some manipulation to get these leaves in right, but the worms know how to perform it, and can discriminate between the easiest way to draw the leaf in and other ways. When they can not obtain leaves, petioles, sticks, etc., with which to plug up the mouths of their burrows, they often protect them by little heaps of stones; and such heaps of smooth, rounded pebbles may often be seen in gravel-walks. Their strength is shown by their often displacing stones in a well-trodden gravel-walk, a task that sometimes demands considerable effort.

Worms excavate their burrows in two ways: by pushing away the earth on all sides where the ground is loose or only moderately compact, and by swallowing the dirt, where the ground is hard, and ejecting the swallowed earth afterward in the form of the "castings" which are found at the mouths of their burrows. They also swallow the earth to extract the nutritious matter which may be contained in it, and in larger quantity than for making their burrows; and the residue of this, after

castings may be seen in garden-walks piled up in towers of greater or less height around the burrows. The towers formed by a naturalized East Indian worm, at Nice, France, which are sometimes distributed as thickly as five or six to a square foot, are built to a height of from two and a half to three inches. The tower of a perichaeta in the Botanic Garden of Calcutta, of which Fig. 2 is an exact representation, measured three and a half inches high and 1.35 inch in diameter.

Some of the towers, as the figure shows, exhibit a considerable degree of skill in their construction. The castings are not always ejected on the surface of the ground, but are often lodged in any cavity that may be met in burrowing. The burrows run down, sometimes perpendicularly, generally a little obliquely, to a depth of three, six, and even eight feet, and are usually lined with a thin layer or plaster of fine, dark-colored earth which the animals have voided, in addition to which a lining is made, near the mouths, of leaves, also plastered. Bits of stones and seeds are also sometimes found in the bottom of the burrows, having been taken down apparently with a purpose.

The amount of earth brought up by worms from beneath the surface has been carefully estimated by observing the rate at which stones and other scattered objects on top of the ground are buried. A piece of waste, swampy land, which was inclosed, drained, plowed, harrowed, and thickly covered with burned marl and cinders, and sowed with grass, in 1822, fifteen years afterward presented the appearance, where holes were dug into it, shown by Fig. 3, the scale of which is half that of nature. Beneath a sod an inch and a half thick was a layer of vegetable mold, free from fragments of every kind, two and a half inches thick. Under this was another layer of mold, an inch and a half thick, full of fragments of burned marl, fragments of coal-cinders, and a few white-quartz pebbles. Beneath this layer, and at a depth of four and a half inches from the surface, the original black, peaty, sandy soil with a few quartz pebbles was encountered. Six and a half years afterward this field was re-examined, and the fragments were found at from four to five inches below the surface, having been covered in that time with an inch and a half more of mold. The average annual increase of thickness for the whole period was .19 of an inch. This was less than the average increase of thickness in some other fields similarly observed, in which the accumulation amounted to .21 and .22 of an inch annually. Another field, which was known as "the stony field," and in which the stones lay so thick that they clattered as one ran down the slope of the hill, became so covered with mold in thirty years that a horse could gallop over the compact turf from one end of the field to the other, and not strike a stone with his shoes. A flagged path in Mr.

FIG. 2.—A TOWER-LIKE CASTING, PROBABLY EJECTED BY A SPECIES OF PERICHAETA (from the Botanic Garden, Calcutta: of natural size, engraved from a photograph).

the nutriment is extracted, is also cast out. The deposition of castings is no insignificant part of the labor that they perform, and leaves very perceptible traces on the surface. The

FIG. 3.—SECTION, REDUCED TO HALF THE NATURAL SCALE, OF THE VEGETABLE MOLD IN A FIELD, DRAINED AND RECLAIMED FIFTEEN YEARS PREVIOUSLY. A, turf; B, vegetable mold without any stones; C, mold with fragments of burned marl, coal-cinders, and quartz-pebbles; D, sub-soil of black, peaty sand, with quartz-pebbles.

Darwin's garden disappeared, in the course of years, under an inch of mold with which the worms covered it.

A stone, sixty-four inches long, seventeen inches broad, and from nine to ten inches thick, part of the ruins of a lime-kiln that had been torn down thirty-five years before, lay in a field, its base sunk from one to two inches

below the general level, while the surface of the field for about nine inches around it sloped up toward it to the height of four inches above the surrounding ground close to the stone. (Fig. 4.)

When the stone was removed, an exact cast of its lower side, forming a shallow crateriform hollow, was left, the inner surface of which, except where the base had been in contact with brick rubbish, consisted of fine black mold. The turf-covered border, which sloped up to the stone, consisted of fine vegetable mold, in one part seven inches thick, and was evidently derived from worm-castings, several of which had been recently ejected. This stone would have sunk to the level of the field in two hundred and forty-seven years if none of the castings were washed away by rains. Some of the fallen stones at Stonehenge have become buried to a moderate depth in the ground, and are surrounded by sloping borders of turf, on which recent castings have been seen.

The estimates of the amount of mold brought up by the worms, based on actual weighings and measurements of the castings at particular spots, give results ranging from 7.56 to 18.12 tons per acre in one year, and a volume sufficient to make when spread out a layer of soil of from one to more than two inches thick in ten years. The remains of ancient buildings seem also to have been buried effectively, in large part, through the action of worms. An example of this kind is furnished at Abinger,

FIG. 4.—TRANSVERSE SECTION ACROSS A LARGE STONE WHICH HAD LAIN ON A GRASS-FIELD FOR THIRTY-FIVE YEARS. A A, general level of the field. The underlying brick rubbish has not been represented. Scale, one half inch to one foot.

Surrey, where the remains of an ancient Roman villa were discovered in 1877. The cut (Fig. 5) represents the appearance presented by the buried wall and the ground around it at a point where one of the trenches was dug. The mold here was from eleven to sixteen inches thick over the tessellated floor, G, and from thirteen to fifteen inches thick over the broken summit of the wall, W. No signs of worms appeared on the trodden-down earth over the *tesserae* when they were first cleared, but many signs of fresh worm-action were seen on the next day, and for the next seven weeks these signs were very abundant. Numerous burrows were

also found in the course of the digging, and worms were brought up from a considerable depth. Three years afterward the worms were still at work, burrowing in the concrete floor and the mortar of the walls.

Other striking examples of the action of worms are found in the ruins of the old Roman town of Silchester, where the concrete floor of the basilica, still covered here and there with *tesserae*, is found at three feet below the surface. Worm-castings were observed on the floors of several of the rooms, in one of which the tessellation was unusually perfect. Open worm-burrows were found beneath all the

loose *tesserae*; worms have penetrated the old walls of the ruins, and were found in them, with traces of mold; and the pavement had sunk considerably in nearly all the rooms.

The chief share of the work of covering the buildings is attributed to worms.

Worms also contribute to the disintegration of the rocks and the denudation of the land,

FIG. 5.—SECTION THROUGH THE FOUNDATIONS OF A BURIED ROMAN VILLA AT ABINGER. A A, vegetable mold; B, dark earth full of stones, thirteen inches in thickness; C, black mold; D, broken mortar; E, black mold; F F, undisturbed sub-soil; G, tesserae; H, concrete; I, nature unknown; W, buried wall.

by generating humus acids which act on the carbonates, by grinding up in their crops the stones they swallow, and by bringing earth to the surface in their castings, to be blown away by the winds and washed away by the rains into the valleys. They are extraordinarily numerous. Hensen says there are 53,767 of them

in an acre of garden-soil, and Mr. Darwin is willing to allow half that number, or 26,886, to the acre in corn-fields and pasture-lands; and as in many parts of England a weight of more than ten tons of dry earth annually passes through their bodies and is brought to the surface on each acre, the whole superficial bed of

FIG. 6.—A NORTH AND SOUTH SECTION THROUGH THE SUBSIDED FLOOR OF A CORRIDOR PAVED WITH TESSERÆ (Silchester). Outside the broken-down bounding walls, the excavated ground on each side is shown for a short space. Nature of the ground beneath the tesserae unknown. Scale, $\frac{1}{16}$.

vegetable mold must pass through them every few years. By triturating this earth, by subjecting its minerals to the action of the humus acids, and by periodically exposing the mold to the air, they prepare the ground in an excellent manner for the growth of fibrous-rooted plants and for seedlings. The bones of dead animals,

the harder parts of insects, the shells of land-mollusks, leaves, twigs, etc., are before long all buried beneath the accumulated castings of worms, and are thus brought in a more or less decayed state within reach of the roots of plants. Leaves are digested by them and converted into humus. Their burrows, penetrat-

ing to a depth of five or six feet, are believed to aid materially in the drainage and ventilation of the ground. They also facilitate the downward passage of roots of moderate size, which are nourished by the humus with which the burrows are lined. Many seeds owe their germination to having been covered by castings; others, buried more deeply, lie dormant till they are brought under conditions favorable to germination.

ECUADOR (REPÚBLICA DEL ECUADOR). Particulars relating to area, territorial division, population, etc., of this republic will be found in our volumes for 1873 and 1878.

The President is General Ignacio de Veintemilla, inaugurated in December, 1876, and declared dictator for an unlimited period in 1878. The First Designado (or Vice-President) was Señor L. Salvador; the Second Designado (or Second Vice-President), Señor J. Novoa; and the Cabinet was composed of the following ministers: Interior and Foreign Affairs, General C. Bernaza; Finance and Public Works, Dr. Martin de Icaza; War and Marine, Colonel F. Boloña. The Governor of Guayaquil was General J. Sanchez Rubio.

No official returns having been published for a number of years past, it is impossible to give an exact statement of the revenue and expenditure of this distracted country. The former seldom, if ever, exceeds \$2,500,000; while the latter rarely falls short of \$3,500,000! More than one half of the entire revenue is derived from the custom-house of Guayaquil.

The total national debt of Ecuador amounted to \$11,459,000, including the British loan, the particulars concerning which, and the probabilities as to its extinction, are set forth in the subjoined report of the proceedings at a meeting of the bondholders:

Mr. Hyde Clarke (the secretary to the Council of Foreign Bondholders) having read the notice convening the meeting, the Right Hon. E. P. Bouverie stated that the requisitionists were very largely interested in this debt, and their desire was to obtain the sanction of the meeting to a resolution proposing the basis of an arrangement which they hoped might be effected with the state of Ecuador for the purpose of settling the debt. There was a committee of Ecuadorian bondholders, which had sat at the offices of the corporation for some years, and they had fully approved the object of the meeting. The debt was a very old-standing affair. He believed it arose originally from the partition of the ancient Colombian debt, about fifty years ago, between the different states which were then split up out of the old state of Colombia, which had incurred the debt in the wars with Spain. Ecuador paid interest on this debt to a small extent for about twelve or thirteen years, under an arrangement made so long ago as 1854. It then suspended payment, and he believed an act of Congress was passed shortly afterward repudiating the debt. They hoped, however, that a better tone and temper was springing up on the part of the states of South America, indications of which he had found during his experience in that office, and they hoped that that spirit had extended to the Government of Ecuador. At any rate, the requisitionists thought they saw their way to effect an arrangement which would be advantageous to themselves and to the bondholders generally. A short time ago they had deputed a gentleman to go out to Ecuador and

communicate with the Government, with the view of effecting an arrangement which they thought might be submitted to the bondholders. That, however, had not yet been done, for this reason, he understood—that the President of the republic, who was more or less a dictator, but who to a certain extent held his authority and power with the consent of the representative Congress in that country, had said that it was useless for him to propose an arrangement for the acceptance of the Congress, however much he might desire it, unless he received some indication that it would be accepted by the bondholders, as, in the event of its rejection by them after he had induced the Congress to approve an arrangement, he would damage his position. That seemed to him (the chairman) not an unreasonable view, and he believed that the object of the meeting was to see whether they could not agree to a resolution laying down the pecuniary basis on which some such arrangement could be come to as would be acceptable generally. Mr. Robert Campbell, one of the requisitionists, then moved a resolution expressing the readiness of the bondholders to accept an arrangement of the debt which would adequately secure to them, in lieu of their present bonds and arrears of interest, not less than £950,000 new sterling bonds, with interest payable in sterling in London, of not less than 5 per cent, with a sinking fund of 1 per cent accumulative, to be increased after five years to 2 per cent. The re-establishment of the credit of Ecuador on the European bourses would, he continued, be to the great advantage of the Ecuadorian people, and would enable them to develop the immense virgin resources of the country. The large proposed reduction of the debt would show them that the bondholders desired to meet them in a liberal spirit. Dr. Wild having seconded the motion, Mr. F. Bennoch thought it advisable to state the precise condition of the debt at the present moment, in order that the bondholders might understand the position they now occupied, and that in which they would be placed in the event of the terms of the resolution being accepted by the Ecuadorian Government. The chairman replied that the present principal of the debt, as arranged in 1854, was £1,824,000, bearing 1 per cent interest, with the possibility of a rise in the event of the yield of the Guayaquil custom-house exceeding \$400,000 a year. They, however, never received any increase over the 1 per cent, which, as he had stated, they had received for a few years only. The arrears of interest amounted to £264,480 (29 coupons). Therefore, the indebtedness was £2,088,000, which it was proposed should be converted into £950,000 of new 5 per cent bonds. The composition would, therefore, be nearly 10s. in the pound. The amount required under the new arrangement would be £47,500 a year. Mr. Campbell pointed out that that amount was to be made by a population of over 1,000,000. Mr. Wright (of the Ecuadorian Bondholders' Committee) observed that when the old arrangement was made the bondholders were entitled to 25 per cent of the customs' dues, which he understood from Mr. Hazlewood amounted last year to £200,000. Therefore last year the bondholders should have received £50,000. The progress of the South American republics was, he said, stopped by the position of their debts, and if they were arranged their immense natural resources could be developed. It was to be hoped that if the Ecuadorian Government came to an arrangement with the bondholders, they would keep it this time. Mr. Van Raalte having alluded to a sum of £11,000 which, he said, was now in the Bank of England belonging to the bondholders, Mr. Hazlewood referred to his visit to the country a few years ago on behalf of the bondholders, and expressed his belief that the Government of Ecuador would acquiesce in the terms submitted in the resolution. A bondholder stated that the President and ministers had offered to give the salt-duties, which were now £50,000 a year, and could be developed to £70,000, as security for any new arrangement. The chairman then put the resolution, and declared it carried unanimously.

The total value of the imports at the port of Guayaquil, through which the foreign commerce of the republic is almost exclusively carried on, was estimated at \$7,500,000 Ecuadorian pesos,* and the exports at \$9,437,240, for the year 1879. The following table exhibits the quantities and values of the Ecuadorian staples exported in that year:

ARTICLES.	Quantity.	Value in Ecuadorian currency.
Cacao, (pounds)...	31,546.657	\$6,624,797 97

Grand total.....	\$1,148,350 88
------------------	----------------

It is interesting to see the marked increase in the imports from the United States to Ecuador within the past few years, and particularly in 1879, as compared with 1878, in which latter the value of said imports was but \$723,000 in American gold. In 1878, the imports from and exports to Great Britain were of the values of \$1,022,000 and \$1,020,000 respectively; in 1879, they were \$1,410,000 and \$2,615,000; and in 1880, \$1,760,000 and \$3,235,000. The imports from and exports to France in 1878, through Guayaquil, were of the values of \$561,000 and \$157,000 respectively. Thus, the trade with the United States, though rapidly extending, is still far behind that with Great Britain.

The shipping movements at Guayaquil were as follows in 1879:

FLAGS.	ENTERED.			CLEARED.		
	Steamers.	Sailing-vessels.	Tonnage.	Steamers.	Sailing-vessels.	Tonnage.

Total.....	118	110	215,820	118	107	215,612

The foregoing statistics of trade with the United States have been compiled mainly from the interesting and comprehensive returns forwarded by Consul McLean to the Department of State.

EDUCATION, TECHNICAL, IN SAXONY. A small volume written by Mr. Felkin, an Eng-

* The Ecuadorian peso is reckoned by the American consul at about 69 cents of United States currency.

lish manufacturer resident at Chemnitz, in Saxony, describes the town, its industry, and the schools in which the artisans and the manufacturers, managers, and foremen of the town and neighborhood receive elementary and technical instruction. As this subject of the special instruction of the manufacturing population is yearly becoming more and more important, it is well to record what is being done

in a manufacturing district in the center of the German Empire, Saxony being taken as a fair type of North Germany. Mr. Felkin is a native of Nottingham, England, and has, since 1861, carried on at Chemnitz the manufacture of hosiery, which is also the staple trade of his native place. Besides hosiery, woven fabrics of various kinds are produced; and where water-power was formerly largely employed, steam-engines are now generally in use. Hand-looms and frames are also almost entirely superseded by the latest improvements in mechanical contrivances. Chemnitz is readily accessible by railroad from all parts of the empire, and has large and flourishing factories for locomotives, steam-engines, engineering tools, etc. The workshops of the Saxon Government railroads are placed there, and give employment to five thousand hands. Mr. Felkin points out the significant fact that, in the manufacture of gloves, the Chemnitz workmen have literally destroyed the trade of Nottingham, and, further, that they not only sell their wares in the United States and South America, but have established an agency in Australia. The population of Chemnitz has increased from 40,000, twenty years ago, to 90,000 in 1879; and the surrounding villages have a population of about the same number.

Elementary education here, as everywhere in Germany, is compulsory; and the children of the very poorest class attend the public elementary schools until at least the age of fourteen. After they have left these schools and gone to work, they are still obliged to attend the evening (*Fortbildung*) school two evenings in each week for two more years. They then become eligible for voluntary attendance in the schools for foremen, for the building trades, and for instruction in elementary drawing. These elementary schools do not receive assistance from the state, and the school-fees vary from \$1.75 per annum in the lowest division, to \$6.35 in the highest class of the highest division. These fees cover about one fourth the cost of maintaining the schools; the other three quarters are borne by the municipality. There are also schools of the same grade, attended by children of wealthier parents, with fees varying from \$11.52 to nearly \$15.00. Children passing through these schools may, if qualified by examination, enter the classical school (*Gymnasium*), or the modern school (*Real Schule*), at the age of ten; or they may, after completing the elementary course, continue their education in one of the technical schools.

The regular course of instruction in the elementary schools includes moral and doctrinal religion, arithmetic, geometry, grammar, composition, history, natural history, geography, and gymnastics. The school board has in it always a clergyman and three of the head masters of the schools. Chemnitz school district, including a suburban area, contains 152,000 inhabitants, of which one sixth (about 25,000)

attends the elementary schools. Private schools and teaching are almost unknown in Germany. The *Gymnasium* of Chemnitz, a fine structure, erected at a cost of about \$63,000, is attended by 350 scholars, who receive instruction from a rector, a sub-rector, and 20 masters. Besides classical instruction, its curriculum includes modern languages and physical science; and students pass from this to the university. The modern school (*Real Schule*) cost about \$87,000. It receives a subsidy from the state of nearly \$3,000 per annum. It has a director and 26 masters, and is attended by 430 scholars. In place of classics are taught natural history, chemistry, physics, mathematics, mechanical and free-hand drawing, so as to prepare the pupils for the polytechnic and mining schools. The fees in each of these schools are nearly \$80 per annum. Chemnitz has also a public commercial school, with appropriate studies and 170 scholars. In addition there is an evening (*Fortbildung*) school, established by a workmen's union, at which about 1,900 scholars attend.

All the preceding schools are under the direction of the Minister of Education and Public Worship. The three technical schools, viz., the Technical Institute, the Higher Weaving School, and the Agricultural School, are under the Minister of the Interior. Of these, the Technical Institute is carried on in a building erected by the state at a cost of about \$400,000. It is partly supported by fees, the balance of the income needed being made up by the state. The Higher Weaving School was erected by the municipality, and is maintained by fees and subsidies of \$726 each from the state and the town. The Agricultural School is a recent foundation, and has a small grant from the state. Mr. Felkin has fully described, and illustrated by plans, the laboratories, lecture-room, libraries, and museums of the Technical Institute, which may fairly compare with the more celebrated schools of Germany and Switzerland. It has four departments—the Higher Technical, the School for Foremen, that for the building trades, and the Art School. The Higher Technical School has three branches, one for mechanical engineering, a second for chemical technology, and a third for architecture. Its courses extend over seven *semesters* (a *semester* = six months). The first three are general, after which special subjects are studied. These courses qualify for industrial employment and for the profession of an architect; students, however, who seek for employment in architecture by the state must complete their education in the *Bau-Academie* of Dresden, or in some institution of equal rank. The fees are \$14.50 per semester, and there are 150 students. The School for Foremen has two winter courses of six months each, and two branches of study, viz., one for mechanical and the other for chemical industry. Students are admitted at the age of sixteen, and must have worked for two years at

their trades before admission. Generally they are selected from promising young workmen, educated in the public elementary schools. There are 230 students, who pay \$7.25 for each course. The fee is frequently remitted in cases of unusual merit. These courses include arithmetic, geometry, physics, chemistry, mechanics, and other subjects of technical instruction, as well as German literature and book-keeping. In order to obtain admission to the school for the building trades, students must have worked at their trades for two years. There are four winter courses, adapted to the special wants of the pupils, and generally during the other six months they work at their trades. The students number 170, and the fees are the same as in the School for Foremen. The Art School has 110 students. The Higher Weaving School at Chemnitz, which is one of several in Saxony, appears to be the most important, and its courses are attended by young men from all parts of Europe, including the sons of large manufacturers in England. It has a fine, commodious building, four teachers (of whom two are practical weavers), and students varying in number from 30 to 50. The course occupies two half-years, and the fee is \$65.50. Its instruction includes properties of materials used in weaving, construction of looms, composition of patterns, drawing, etc. The Agricultural School was begun in 1877 with 20 pupils; in two years its numbers increased to 60, with a prospect of still further increase. It is held in the winter months, and is especially serviceable to small land-owners and tenant-farmers. Besides these schools there are others for mechanical weaving, intended for hand-loom weavers, held on Sundays, an evening-school for practical tailoring, etc.

It is believed by some that the educational advantages in Germany have enabled its manufacturing population to compete successfully with English workmen. Probably this may be right, though, at the same time, the cheapness of wages in Saxony must be taken into account as an element in the problem.*

EGYPT, a tributary of Turkey, in North-eastern Africa. The ruler of Egypt, who has the title of Khedive, is Mohammed Tefvik, born in 1852, the eldest son of Ismail Pasha, who resigned June 26, 1879. The eldest son of the Khedive is Prince Abbas Bey, born July 14, 1874.

The area of the entire Egyptian territory is estimated at 2,987,000 square kilometres, with 17,400,000 inhabitants. Egypt proper has about 1,021,354 square kilometres, with a population of 5,517,627. The number of foreigners, in 1878, was 68,653, of whom 29,963 were Greeks, 14,524 Italians, 14,310 French, 3,795 English, 2,480 Austrians, 1,003 Span-

iards, 879 Germans, 752 Persians, 358 Russians, 139 Americans, 127 Belgians, 119 Netherlanders, and 204 others.

The population of the principal cities was as follows in 1877 :

Cairo.....	327,462
Alexandria.....	165,752
Damietta.....	32,730
Rosetta.....	16,243
Suez.....	11,327
Port Said.....	3,854
Port Said (in 1881).....	13,294

After a long period of disorder in the financial condition of Egypt, order has at last been restored. In April, 1880, the Commission of Liquidation, composed of members delegated by the Governments of Germany, Austro-Hungary, France, Great Britain, and Italy, met at Cairo and framed a law, which was promulgated on July 17, 1880. The principal stipulations of this law are—1. Payment of the floating debt, 30 per cent in cash, and 70 per cent in bonds of the new privileged debt; 2. Conversion of the so-called short loans (of 1864, 1865-'66, and 1867) into bonds of the unified debt, with a reduction of the rate of interest to 4 per cent. The debt on January 1, 1881, was as follows :

Title of debt.	
Unified debt at 4 per cent.....	£57,776,840
Privileged debt at 5 per cent.....	22,587,800
Domain loans at 5 per cent.....	8,499,620
Daira Sanieh loans at 4 to 5 per cent.....	9,512,870
Total.....	£98,376,630

To this amount it is necessary to add a home debt, which should be paid in fifty annual installments of 150,000 Egyptian pounds each (1 Egyptian pound = \$5), and the interest on the shares of the Suez Canal, bought by England in 1875, amounting to £200,000 annually.

The budget for 1881 was as follows (in Egyptian pounds):

RECEIPTS.	
Direct taxes.....	£3,322,073
Indirect taxes.....	1,563,737
Railroads and telegraphs.....	1,145,575
Other receipts.....	383,086
Total.....	£8,419,421

EXPENDITURES.	
Tribute.....	£631,456
Public debt.....	8,783,840
Administration.....	8,683,544
Total.....	£18,303,876

The military forces of Egypt comprise the regular army and the irregular troops. The regular army is composed of six regiments of infantry, two regiments of cavalry of six squadrons each, one regiment of field-artillery, and three regiments of artillery for fortresses, making in all 15,000 men. The irregular troops comprise seven mounted corps, each containing 4,000 men.

The navy in 1880 comprised two yachts, one frigate, one school-ship, four dispatch-boats, two transports—in all, ten steamers.

The total value of Egyptian commerce in 1855 was estimated at 275,000,000 piasters

* The average weekly wages of mechanics in a locomotive and engineering factory in Chemnitz were, in 1870, as low as \$3.12; a few years later they were \$4.32; at present they are about \$4.00. For similar work, in England, mechanics receive \$5.50 per week; and in the United States wages are considerably higher.

(1 piaster = 4 cents), in 1862 at 506,000,000, in 1870 at 1,028,000,000, in 1875 at 1,333,000,000, in 1876 at 1,356,000,000, in 1877 at 1,275,000,000, in 1878 at 810,000,000, in 1879 at 1,344,000,000, and in 1880 at 1,298,000,000 piasters. The commerce with the different countries in 1880 was as follows (value in piasters):

COUNTRIES.	Imports.	Exports.
Great Britain.....	848,749,000	907,494,000
France.....	112,983,000	111,410,000
Austria.....	8,895,000	35,636,000
Italy.....	26,748,000	54,844,000
Turkey.....	13,164,000	73,740,000
Russia.....	8,821,000	72,267,000
America.....	7,408,000	9,886,000
Greece.....	1,088,000	13,869,000
Other countries.....	46,142,000	19,686,000
Total.....	654,998,000	1,298,832,000

The value of the principal articles of import and export in 1880 (in piasters) was as follows:

ARTICLES.	Imports.	Exports.
Cereals.....	229,452,000
Cotton-seed.....	154,548,000
Sugar.....	19,548,000	75,598,000
Fermented liquors.....	16,891,000
Articles of food.....	31,816,000
Oil.....	58,558,000
Metal and metal goods.....	25,728,000
Hides.....	10,051,000
Ostrich-feathers.....	10,253,000
Spinning materials.....	14,421,000	752,540,000
Wood and Ivory.....	27,086,000	2,970,000
Woven goods.....	292,835,000
Yarns.....	13,944,000
Machinery.....	12,236,000
Boots and shoes.....	13,719,000
Drugs.....	33,258,000
Fats and oils.....	27,155,000	20,491,000
Other goods.....	63,308,000	42,989,000
Total.....	654,998,000	1,298,832,000

The receipts of the Suez Canal Company for 1880 amounted to 41,790,900 francs, the expenses to 28,811,803 francs, leaving a balance of 12,979,097 francs. After deducting the statutory reserve of 5 per cent, a balance of 12,330,145 francs remained. In 1880, 2,017 vessels, of 4,378,064 tons, passed through the canal. The nationality of these vessels was as follows:

COUNTRIES.	Vessels.	Tonnage.
Great Britain.....	1,579	8,460,977
France.....	103	274,990
Netherlands.....	69	173,181
Austria.....	60	116,041
Italy.....	52	105,279
Spain.....	35	85,612
Germany.....	33	54,127
Russia.....	22	46,689
Denmark.....	11	11,080
Turkey.....	10	13,650
Sweden and Norway.....	8	11,379
Portugal.....	6	5,339
Others.....	24	19,570
Total.....	2,017	4,378,064

The length of railway lines in 1880 was 1,518 kilometres. The number of post-offices in 1880 was 130. The number of domestic letters sent was 2,925,084; the number of

postal-cards 48,000; the pieces of printed matter, newspapers, and merchandise, 1,556,000; the number of money orders sent, 38,125, for 39,608,000 piasters; the number of money packages, 32,500, for 1,107,000,000 piasters. The number of foreign letters and postal-cards sent and received was 1,625,139; of newspapers, etc., 1,063,000; of money orders, 11,440, for 4,500,000 piasters.

The two Comptrollers-General, De Blignières and Colvin, made their annual report to the Khedive on the 21st of February. The former Viceroy, Ismail, had not only plunged the country into debt, but had disorganized the entire machinery of the administration. The first task of the two comptrollers was to liquidate the enormous debt. A commission was appointed, composed of representatives of the great powers, and representatives of the Egyptian Government, which in three months elaborated the decree for liquidation, presented to the Khedive on July 17, 1880, and signed by him.

The first step necessary for carrying out the settlement was to realize on the Rothschild loan of 8,500,000 pounds sterling face value; which would yield, after the deduction of the commissions, the first coupon, and the discount, 5,635,500 Egyptian pounds (\$28,290,000). Interminable hindrances stood in the way of the realization. Other public creditors held mortgages upon the state demesnes which were hypothecated for this loan, and new liens were being constantly registered. The prior mortgages were finally lifted by means of money advances from Rothschild, after the later claims had been removed by a viceregal decree annulling the judgment of the Court of Appeals at Alexandria, and declaring the demesnes not subject to execution. The proceeds of the loan were thus made available. The financial transactions for the first year left a surplus. The comptrollers apply the entire surplus from the revenues set aside for the settlement of the debt, when there is a surplus, to the sinking fund. If they yield a surplus sufficient to satisfy the stipulated requirements of the sinking fund, one half of one per cent of the amount of the public debt annually, the remaining revenues are left at the disposition of the Government; but, if they do not, enough is taken from these to make up the amount required for sinking the debt. The budget for 1881 was made up in accordance with these rules. The ordinary receipts for the foregoing year were 5,034,267 Egyptian pounds as returned by the departments, and 4,370,030 pounds (\$21,740,900) when comptrolled. The extraordinary receipts were expected to amount to about 300,000 pounds (\$1,500,000), and were disposable by decree of the Khedive. The comptrollers recommended their application to public works, as 135,000 Egyptian pounds were needed for the railroads, and as much as 300,000 for public buildings. The revenues for 1880, the report shows, yielded under the re-

formed administration a surplus over expenditures sufficient to add 153,000 Egyptian pounds to the sinking fund, and furnish at least as much for improvements on public works. For some time to come the debt settlement will consume 40 per cent of the total revenues of the state.

The effect of the settlement of the debt question by the liquidation law was to raise the price of Egyptian securities in the market from 150 to 360 francs. Before the close of the year 1880, 11,424,000 Egyptian pounds of floating debt had been paid off, and there remained 1,021,000 pounds yet to settle. The revenues assigned for the payment of the debt and interest are the land-taxes of four provinces and the customs duties.

The public debt of Egypt, amounting to \$365,000,000, exclusive of the Daira and Domain debts, which come to \$85,000,000 more, is an enormous burden for a land which has no mines, forestries, or manufactures, and derives its entire revenues from 4,750,000 acres of agricultural land. The revenue reaches barely \$42,500,000, out of which as much as \$20,000,000 go to the creditors, and \$3,500,000 are paid to the Sultan. The favorable financial results of the year 1880, when, in addition to the fixed obligations, \$1,500,000 surplus was applied to sinking the debt, are attributed by Mr. Money to an abundant harvest, improved trade, the readjustment of the land-tax, the abolition of tax-payments in kind, and the better legal facilities for the collection of arrears in taxation. The two coupons of the unified debt were paid, amounting to \$11,250,000; the deficit of the privileged debt, amounting to \$1,250,000, was made up; the large amount due to the sinking fund was paid; and the above surplus left over. The law of liquidation increased the privileged debt \$18,750,000, making the annual charge for this part of the debt some \$6,000,000.

The accomplishment of the far-reaching reforms which have been instituted in the Government of Egypt is ascribable in a great measure to the merits of Riaz Pasha. The substitution of a Government monopoly of salt, for the system by which the purchase of this commodity was made compulsory, has not resulted favorably for the revenue thus far, by reason of deficient supervision. In January, 1880, twenty-eight small but vexatious taxes were abolished, the poll-tax was done away with, and the trade-taxes were reduced to narrower limits, those which weighed down agricultural occupations being happily removed altogether. The resulting losses to the revenue were made good by an increase in the *Ushuri*, or tithes, resting upon lands.

The *Mukabala*, one of the most vicious financial measures in Ismail Pasha's whole category of impolicy, was remedied at the same time. This was an arrangement by which proprietors could, by the payment of certain assessments, purchase a partial immunity from the land-

taxes for all time. The actual losses accruing to persons who had taken the benefit of this law, by its abolition, were made good to them by Treasury warrants. The land-tax laws were referred to a commission for revision. To establish a rational system of land-taxation in Egypt is a work of long study and labor. The survey and registration of the lands is first necessary, and this work was immediately begun. But, like all public business in Egypt, this simple task soon got into a tangle. General Stone, the chief of the army staff, was intrusted with the supervision of the survey. After nine months of topographical work he was replaced, April 7, 1880, by a commission, which set to work to revise the work performed, and adjudged the greater part of it unsatisfactory. The 300,000 Egyptian pounds thus far expended were consequently wasted, and the labor of surveying the country will not be completed in less than fifteen years, unless a larger force and more capable directors are employed.

The decree of February 25, 1880, fixing the time for the payment of taxes, affords a desired relief to the Fellahs by making the collections fall in harvest-time, and not when the agriculturist has paid out most of his money in preparing for the next crop. In Lower Egypt the taxes are collected, under the new regulations, in part after the cotton-picking, which commences in October, and in part after the winter crop is harvested, or in April and the succeeding months, while during the months of March, August, and September no taxes are collectable. In Upper Egypt nearly all the collections are made between April and August. The *Kurbaj* is still resorted to, and delinquent Fellahs are made to produce their hoards under the lash.

Payments of taxes in kind are abolished, since the improvements in the means of communication, especially in the postal system, enable the inhabitants of the remotest districts to convert their produce into money. The position of the tax-gatherer was materially bettered by allowing him a yearly salary of twelve Egyptian pounds, while the percentage which he is allowed from the collected taxes has been reduced one tenth. Through this change the prevailing system of extortion will be remedied to some extent, and the tax-payer somewhat relieved from the necessity of providing for the support of the collector on a more or less liberal scale, in addition to the payments which find their way into the Treasury.

The tariff has been submitted to thorough regulation, and the collection of customs placed in charge of a better director, with the result that they have yielded in the first year a surplus of 100,000 Egyptian pounds. The system of statute labor the new administration would like to abolish, and they have striven to restrict the demands to the lowest practicable limits. Nevertheless, the Department of Public Works were obliged in 1880

to require 15,000,000 days of compulsory service upon works of indisputable public utility. At first a regulation was made, allowing the Fellahs to purchase release from personal service by the payment of a sum of money; but the law was changed so as to require every one to furnish a substitute before he can secure his discharge, since it was found that the indemnity fee was paid by all the Fellahs, and labor could not be hired.

The education of the people, a matter which has hitherto been sadly neglected, has been taken hold of, and a commission appointed for the elaboration of a plan of reform. The first decision arrived at has been put into execution by the establishment of a normal school.

The Khedive himself, who was made a poor man by the surrender of his estates in 1877, makes but a modest demand on the public revenues, the civil list assigned him being only \$500,000 in amount. The family connections are more exacting, absorbing \$1,100,000, including the ex-Khedive's allowance. The National Debt Office is a burdensome appendage, costing \$250,000 a year in high salaries paid to the European officials. The two chiefs receive \$20,000 each. Expensive foreign functionaries are attached also to the Railway, Domain, and Daira Departments. The payment of high salaries to international assistants has had the result of securing to the ministers an increase in their salaries of from \$7,500 to \$15,000.

The cost of the army is \$1,850,000 a year, of the navy \$300,000. The army numbered, at the time of the financial report, 13,500 officers and men, and the navy not quite 11,500. The pay of the soldiers was complained of as insufficient, that of the officers averaging about \$500 a year, and that of the men barely \$50.

A decree, dated March 30th, created a National Board of Education, on the French model. It possesses extensive powers, and is the supreme authority in educational matters. The Minister of Public Instruction is the president of the board. The amount assigned for purposes of public instruction in 1881 was \$405,000. In the elementary education of the people there has not even a beginning been made yet. Of the above appropriation \$50,000 was set aside for the new organization of education; \$40,000 was assigned for the new normal school; an equal sum is spent on the education of young men in France, and various Government schools for law, technical instruction, medicine, languages, etc., consume the remainder.

The prison management, police, and quarantine systems in Egypt are very defective, but they have the advantage of being inexpensive. A curious item in the budget provides \$450,000 for protecting and feeding the pilgrims to Mecca, and to encourage the great annual pilgrimage. The mixed tribunals cost over \$750,000 a year. The native courts of justice cost, with their host of functionaries, less than

one third as much, but their administration of justice is of the worst description. The sum set aside for the year to meet the expenses of the new judicial organization which is projected is only \$45,000. The nominal amount appropriated for public works is \$2,250,000. Of this, \$250,000 was for the protection of the country against floods, \$500,000 for the maintenance of the great arterial canals called the Mahmoudieh, the Katatbeh, the Ibrahimieh, and the Ismailieh. The maintenance of the Cairo Theatre, the Boulak Museum, and other expenses which are otherwise classed in most countries, are included in the budget for public works.

The exceedingly primitive and scanty needs of the people explain the facility with which the extraordinary demands for the liquidation of the debt are met. The food, clothing, and houses of the Fellah cost next to nothing. He very seldom indulges in the only luxury of his class, that of keeping two wives. His savings are put in jewelry, which he converts into money again in hard times. The Nile fails the agriculturists, and a bad harvest occurs, on an average once in every five years. Since the present management began, a marked improvement in the houses and the whole standard of comfort of the Fallaheen has been observed.

The improvement in the credit of Egypt through the successful operation of the liquidation arrangement was the cause of a sudden expansion of business and a large influx of foreign capital. Companies were established for land cultivation, for lending on mortgage, for building purposes, for sugar-refining, for water-supply, and many other purposes. The interest on money fell, and the price of land rose in many places 300 per cent. Irrigation-pumps and agricultural machinery were imported on a large scale; the importations of these things were 30 per cent greater in 1880 than the year before, and in 1881 showed a still larger increase. The largest part of the new capital embarked in Egypt has come from France.

Counterfeiting frauds, which had been practiced on a large scale for ten years, were discovered in the spring. The headquarters of the coiners were at Geneva and Marseilles. Factories in Switzerland were engaged in turning out millions of piasters—a small, thin coin of the value of five cents—containing 30 per cent less silver than the standard. False Papal francs and small Egyptian and Turkish gold coins were also imported by the criminal organization, which included several persons of position. As much as \$1,500,000 of base money was supposed to be in circulation.

Although the Egyptian dominions cover an area almost as great as Russia in Europe, the lower Nile valley and the delta, which furnish the whole of the revenues with which the Government is supported and the national debt paid, are about the size of Belgium. The rest of the huge empire is a financial drain upon the

resources of the country. In former times the Soodan was the nursery of soldiers and slaves for Egypt. The efforts for the suppression of the slave-traffic, if they are still continued in earnest, are not successful; for gangs are still driven by slavers to the coast. In the seaboard provinces of the Red Sea the Egyptian rule is only nominal a day's march from the coast. The interminable war with Abyssinia has returned no benefits. With the exception of Suakin and a couple of other small ports, the whole of the equatorial provinces are a burden upon the country. The abolition of slavery would probably lead to the gradual commercial development of Upper Egypt. The Khedive is said to be desirous of abolition. But it can only be accomplished by the strong arm, and for that he has not the means, unless his international monitors lend him material assistance.

The situation of Egypt under the present system of international control is not a natural one. If the people had been of a less docile and peaceable nature, and the ruler and political leaders less self-restrained, this system of a foreign directory could not have been imposed without resistance. The establishment of the mixed tribunals by Ismail Pasha ingrafted the principle of foreign interference in the constitution of the country, and these institutions of his own creation became the agents of his downfall. The constitutional issue of the debt crisis was the enforcement, over the Egyptian Government itself, by the foreign governments, which had before 1875 exercised consular jurisdiction, of the principle of the right of jurisdiction of the mixed tribunals that had succeeded the consular courts. The supervision of the entire administration, the management of the finances, and the practical control of all the departments, was at the same time transferred at the dictation of foreign Governments to the international agents of the bond-holders, who were appointed by the intervening powers. France and England chose the two joint comptrollers, and the same powers with Austria and Italy the four commissioners of the public debt. The comptrollers can only be removed by their own governments. They are given full powers of investigation into all branches of the administration. They may attend the meetings of the Council of Ministers, and express an opinion on any public measure. The administration of Riaz Pasha, which was likewise the creature of the intervening powers, followed all the suggestions of the comptrollers, and they themselves have exercised their powers of supreme control in mutual harmony. Since Colvin succeeded Major Baring as the English comptroller, De Blignières has, by virtue of his seniority and longer experience, taken the lead in the management. French and English officials have been at the head of all the important administrations. Besides the control and public debt offices and the judges of the international courts, the cus-

toms, the railways, the telegraphs, the harbors of Alexandria and of the Suez Canal ports, the coast-guard, the light-houses, the post-office, the finance department of the Government, the public works, and the administration of the Domain and Daira lands, are all directed by executive officers of one or the other of those nationalities. The subordinate positions in all the offices are divided between natives and Frenchmen. Through the selection of able and hard-working officials, the French have gained a stronger footing in the administrations than the English. The reforms inaugurated by the initiative of the comptrollers have worked well, and the foreign experts who have been intrusted with the administrative control of the government offices have for the most part performed their duties faithfully and capably. The very success of the foreign administrators in extricating the country from the financial quicksand into which it had fallen, in organizing the general administration of the government and bringing it into working order, and in creating confidence in the future of the country and attracting capital and skill from abroad, hastened the period when native and religious prejudices would come to the surface. Egyptians naturally chafed to see the government of their country taken out of their hands, and all the important posts filled by aliens. The sooner the new system began to work well, the more impatient they were of the government by foreigners. This abnormal situation was the more irksome, from the circumstance that the foreign officials receive salaries which would be enormous in any country, but which are unheard of in Egypt.

The Khedive gave his countenance and support to the administrative reforms. He is fully conscious of the lack of technical attainments and executive ability on the part of his countrymen, and welcomes the aid of the European administrators. He is satisfied that their efforts are working for the best good of his people. He is willing to wait for the plans which his European counselors have in view for the material improvement and intellectual elevation of the Egyptian people, to be matured and to work out their gradual results. He is gratified at the progress which has already been made in that direction, and desires that his people should be schooled in the methods which are being put in practice. But, friend of progress as he is, he is intensely patriotic and thoroughly Egyptian in his feelings, and is also an earnest and devout Mohammedan. He brooks with impatience the position of political effacement in which the circumstances of his succession have placed him, and looks hopefully for a time when he will be more of a ruler in his own land, surrounded by advisers and officers chosen from among his own people. Tevfik was, therefore, on his guard against the development of foreign interests in Egypt, except those which depended on the acknowledged international obligations of the

country, and such commercial enterprises as he deemed conducive to the prosperity and progress of his people.

Industrial and commercial enterprises of all kinds have been welcomed. But the Khedive, whose authorization is necessary before any corporation can be established, has firmly set his face against the acquisition of lands by foreign agricultural companies. In this he has been seconded by the comptrollers.

Egypt has become, in the way explained above, the ward of the Christian powers. There are fourteen governments that claim the right of intervention which England and France have exercised as trustees for the rest. England and France, though acting thus far in harmony, are the chief rivals for the reversion of this part of the Ottoman Empire. Turkey was allowed to take advantage of the situation, to strengthen her hold on Egypt. By the firman of 1879, which confirmed Tefvik on the throne, the Sultan annulled the practical independence which Ismail had purchased at an enormous price, and reasserted his sovereignty in principle by depriving the Khedive of the power of contracting foreign loans and that of indefinitely increasing the army. The limit to which the military establishment is restricted is 18,000 men. Germany, Austria, and Italy do not let the claims of either England or France pass unchallenged. They are seeking to extend their prestige in Egypt. They may cry "Stop!" by their united voice in the European concert, to the aggressions of either of the rivals. The French are the most firmly seated in Egypt; they have done the most for the country, and now exploit it as a commercial dependency, while English mercantile interests in Egypt are waning at present. Yet the old boast that the Mediterranean will become "a French lake" is not now uttered openly. The recent extension of French dominion on the northern coast of Africa has not only awakened the distrust of the English, but has caused serious alarm in Egypt. Great Britain, since the construction of the Suez Canal, claims Egypt as her own property by the right of the stronger, and is prepared to occupy and hold the country with her whole military strength against all comers, and to supersede the government and subjugate the people the moment the submission required by her "paramount interests" is refused.

The change from national independence to a mediatised condition, in which the functions of government were exercised by the agents of European powers, and the Franks were insinuating themselves into all the positions of profit and authority, and in which the Sultan was making his regained sovereignty unpleasantly felt, had its natural outcome in a national movement. This movement took form in 1881. It conflicted with the policy adopted by the Khedive; but from his nature and his position he could not help being in some respects morally identified with it. The

natural champions of the native cause were the army, the only institution which had not been denationalized, and the class which would least appreciate the good in the foreign innovations. The soldiers had a grievance of their own: their native officers were being displaced by Turks. Smarting under this wrong, they assumed the character of the Janizaries of old, with a determination which made it apparent that foreign domination can not acquire much moral strength and authority, even over so docile and submissive a people as the Egyptians, from mere diplomatic arrangements.

A mutiny of troops broke out at Cairo on the 2d of February, of such dimensions that the Government was intimidated, and allowed its course to be dictated by the soldiery. Dissatisfaction had been felt for some time by the Arab officers at the conduct of the Minister of War, Osman Reski Pasha. The minister, who was of Circassian origin, offended the native officers by giving appointments to Turkish officers and favoring them, while he treated the Arabs with arrogance and contempt. The colonel of the body-guards and the colonels of the two other regiments stationed at Cairo presented a petition to the Viceroy, requesting the removal of the Minister of War. The address was handed to the Prime Minister, Riaz Pasha, who in the course of time sent it to the Minister of War. The latter called a council of war, and ordered the three colonels to be placed under arrest. The guard regiment, as soon as they heard of the arrest of their colonel, stormed the arsenal where the officers were confined, and where the investigating board was sitting. Osman Pasha escaped by flight, and Effatun Pasha, his deputy, and General Stone Pasha, the American chief of the staff, were maltreated. Finally, the imprisoned officers were found and borne away in triumph to the Abdin Palace, which was surrounded by the troops, boisterously demanding an audience with the Khedive, to whom they reiterated the demand for the dismissal of Osman. The Khedive indignantly ordered the insubordinate colonels to give up their swords, and met with a flat refusal. The ministers came to the Viceroy and took council. After some deliberation they concluded that it was best to yield. The soldiers, after they were told that Osman was removed, and Mahmoud Sami Pasha el Barudis, at the time Minister of the *Waqf*, or Public Institutions, appointed in his place, departed with salutes and cheers.

The most popular of the refractory colonels, Ahmed Araby Bey, became the leader of the native cause. He possessed all the qualities of a patriot leader and champion of popular rights. In the time of Ismail he had been deprived of his rank through caprice, and succeeded in being restored. From that time he determined to devote his efforts to obtaining the privilege of a fair trial for the officers of the army before they could be dismissed. His sympathies soon extended over a wider field.

The arbitrary and ignoble treatment of the Fellaheen by the officers of the law led him to ponder on a reform in the administration of civil justice by which human rights and the principles of justice should be respected all over Egypt. The idea of inciting the army to demand popular reforms was conceived by Araby Bey and his fellow-officers in the reign of Ismail, but they doubted their success against his organized power and ruthless will. When the step was once taken, Araby Bey was the chosen director of this new and dangerous political force. He possessed the unmeasured confidence of the army, and soon won the devotion of the people. In the spring he gained the ear of the Khedive, and persuaded him of the necessity for certain reforms in the army. In September a military revolution was effected, and the attempt to establish a Pretorian rule of the army over the affairs of the country was for the time being a success. Riaz Pasha's tenure of the premiership had some time before grown insecure. His possible successors were Sherif Pasha and Nubar Pasha, both Egyptian statesmen of pre-eminent standing and distinguished services. Sherif Pasha has held every one of the ministerial portfolios at one time or another, and has been several times prime minister. Though educated in Paris, he is a staunch Mohammedan. He comes from a distinguished family, and bears an unimpeached character for probity. Nubar Pasha is the most widely known of the native statesmen. He was the originator of the international tribunals, and his high talents and broad, statesmanlike views have gained the respect of Europe. The French consul-general, Baron de Ring, an able but ambitious man, agitated for the downfall of the Riaz ministry, and, coming into conflict with the French comptroller, was called to another post. Riaz Pasha was particularly objectionable to the army and the national agitators. He was held responsible for the custom of promoting foreigners, to the exclusion of native talent. He was a foreigner himself, a Circassian, and his expressed preference for Turkish and Circassian officers in the higher commands, as possessing more military talent and experience, rendered him obnoxious to the army. The practice of passing the Arab officers in making promotions was discontinued after the demonstration in February. There were some two thousand army officers in Egypt, the majority of them without commands. They were a unit in the present movement, and their influence over the rank and file was complete.

The Khedive had himself come into conflict with Riaz Pasha. He had insisted on certain measures which Riaz had opposed and slighted. The Khedive declared that he would assume the presidency of his council himself. He thus came to be counted with the growing party which was agitating for the fall of Riaz, and was associated with, although he gave no sign of encouragement to, the revolutionary army

party who were seeking with threats of military violence to have the numerous and high-paid foreign officials replaced by native Egyptians, and otherwise curtail the privileges accorded to foreigners. One of the complaints was that the foreigners who were amassing wealth in Cairo and Alexandria were practically exempt from taxation. The special grievances of the army—the threatened reduction of the forces, the miserable pay, the appointment of unpopular and supercilious Turkish officers, etc.—were more immediately felt. Among all the national aspirations no demand was uttered for the abolition of the comptrollership. The Khedive proposed to the recalcitrant colonels that they make a declaration of their allegiance. Araby signed such a protest of loyalty, but his colleagues refused. The military party had, since the affair of February, insisted on the retirement of the Riaz Cabinet, and on certain reforms in the military service.

On the forenoon of the 9th of February the Minister of War, Daoud Pasha, was handed a document signed by Araby Bey, demanding the dismissal of the ministry, a constitution, and the increase of the army to 18,000, and stating that the troops would appear before the Abdin Palace in the afternoon, and remain there until their demands were satisfied, unless sooner apprised of the assent of the Khedive. The Viceroy, on the advice of Comptroller Colvin and Riaz, proceeded to summon the loyal troops in person to resist the insurgents. At the stated hour 4,000 troops with 18 cannon marched to the palace, and when the Khedive returned he found them drawn up around it. Colvin advised him to advance and arrest the leader. Tevfik commanded Araby to dismount, which he did, sheathing his sword. But, instead of ordering him into arrest, the Khedive asked him his business. Araby Bey replied: "We come for law and justice; so long as you give us both, you are our Effendina; if not, we have your successor ready." Through several foreign representatives, who performed the part of intermediators, a long parley took place. The end of the Khedive's deliberations was, that he agreed to a change of ministers, and promised to submit the other points to the Porte. The insurgents objected to the names proposed by the Viceroy for chief of Cabinet, and insisted on Sherif Pasha. Upon his agreeing to invite Sherif to form a Cabinet, and delivering to the insurgents a letter conferring the appointment, which was read to the soldiers by Colonel Araby Bey, the troops marched to their quarters.

Sherif Pasha was at first reluctant to accept office under such circumstances. The negotiations with the troops were continued the following day, and then broken off. An Assembly of Notables gathered at Cairo, through whose intervention it was arranged that Sherif Pasha should form a ministry, with Mahmoud Sami as Minister of War, that the reforms in the military regulations demanded should be

carried out, with the exception of the increase of the army, and that the regiments should leave Cairo at the time fixed by Sherif Pasha. The immediate occasion for the outbreak had been an order of Riaz to transfer Araby Bey and his regiment to Alexandria.

The new ministry was formed on the 14th. It was composed as follows: Sherif Pasha, President of the Council and Minister of the Interior; Haidar Pasha, Minister of Finance; Ismail Ayub Pasha, Minister of Public Works; Mahmoud Sami, Minister of War; Mustapha Fehmi Pasha, Minister for Foreign Affairs, continuing in the same post which he held; and Kadri Bey, Minister of Justice.

There was much talk in Europe of a military expedition to Egypt to restore order and enforce the authority of the Government. But such an act on the part of either England or France, or both jointly, might lead to perilous complications which they were not prepared to encounter. The occupation of Egypt by Turkish forces and the active exercise of his authority as suzerain by the Caliph, France would not listen to, in view of the complications in Tunis and Algiers. A protest was raised even against the dispatch of Turkish commissioners to the Khedive. The Porte, nevertheless, sent its messengers, Ali Fuad and Nizami Pasha, who assured the Khedive of the satisfaction of the Sultan as to his course, and enjoined the preservation of the *status quo*. The commissioners had hardly begun their work of investigation, when they were suddenly recalled. There are evidences of a secret correspondence between Tefvik and the wily and scheming Sultan, Abdul Hamid. The Khedive, fretting under the dictation of Riaz and the domination of the comptrollers, was inclined to turn for relief to the Sultan, whose suzerainty Ismail had expended all his craft and uncounted treasure to shake off. The Sultan, revolving in his mind the methods of acquiring ascendancy in Egypt, was captivated by a scheme of a certain Hafyz Pasha for organizing Egypt as a privileged autonomous province on the model of the Lebanon. He had previously encouraged Halim, uncle of Ismail, in his efforts to supplant Tefvik on the throne, with French and English consent. The secret agencies of Oriental intrigue have been at work for some time at Cairo, and those elements of the present disorder which can help the Sultan's Pan-Islamic aspirations are fomented at Constantinople. The *ulemas* of the great mosque, El Azhar, are willing instruments of the propaganda, which has spread among the native merchants and lawyers through the efforts of one Sheik Senussi. By these means a schism was produced in the popular party. The army officers who began the agitation, and the land-owners and peasants who embraced the national cause, were as much opposed to Turkish as to Christian aggression, while the Stamboul wire-pullers found means to partially convert the movement into an anti-Christian ferment.

The Pan-Islamic pretensions of the Commander of the Faithful gained in popular favor after the French invasion of Tunis. The fears of British annexation, excited by expressions in the English press, strengthened this sentiment as well as the purely national impulse. Sherif Pasha, though a Turk by blood, has the reputation of being a stubborn foe to Turkish domination.

A dispatch of the British Government to Sir Edward Mallet, sent in November, declared that the British policy in Egypt was opposed to all intervention, and would support the native autonomous government within the limits of the rights accorded by the firmans of the Sultan—that England does not favor separation from Turkey. The present connection with Turkey is a safeguard against foreign intervention and rival ambition. England and France, who share the same views, have co-operated to secure good government. One great reform remains to be effected—good and systematic justice between natives in their dealings with each other. This work should be accomplished by Egyptians, and not by the extension of the international tribunals. The dispatch ends with a warning that this policy would be changed if anarchy or disorder should become prevalent. The fears of a British occupation had taken strong hold of the Egyptians, and were one of the prime causes of the nationalist agitation. The dispatch of Lord Granville was effective in allaying this dread, which was growing stronger.

The Fellaheen, unable to obtain justice from the native judges, have frequently brought their cases by means of legal subterfuges into the international courts. A scheme for a local judiciary was elaborated by the new ministry, and the tribunals were organized and ready to hear complaints by the beginning of 1882. In October occurred another manifestation of the new political forces which had come in play. An injurious expression, characterizing Mohammed as a "false prophet," was printed in the leading European journal, "L'Egypte." The *ulemas*, the students in the great religious university at Cairo, complained to the ministers, who upon examining the context concluded that the phrase had been inserted through an editorial blunder. They accordingly deigned an official admonition sufficient. But the religious community were not satisfied, and demanded the suppression of the newspaper, uttering vague threats, which were repeated by the military; until, finally, the ministry revoked their decision, and suppressed the paper.

The regiments which had made the rebellious demonstration were after a season transferred to different posts without making further trouble.

One of the main demands of the nationalist party was for constitutional government and a House of Representatives. In obedience to his new masters, and with the consent of his old ones, the Viceroy called, for the 23d of De-

ember, an Assembly of Notables to be elected by the people, which was designed to inaugurate the representative system, at least in form. The enthusiasm and independence with which the Fellaheen voted for their representatives revealed to the Government, and to the intriguing representatives of the numerous foreign interests and dynastic factions at Cairo, and their principals in the various capitals of Europe, that the liberal political ideas and nationalistic principles of the popular party had taken a deep root in the minds of the ancient race who once bore the torch of civilization, and who have since tilled their fertile valley under the whip of many masters.

The Khedive has interdicted the world-known ceremony of the *Dosseh*. It was celebrated, every year, on the birthday of the Prophet. The accredited version concerning its origin is this: that an illustrious saint, wishing to convince the people of the sanctity of his mission, had the way from his house to the mosque covered with earthen vases; then, mounting his horse, he proceeded to the house of God without breaking one of the pieces. Those who witnessed the miraculous promenade were struck with wonder, and resolved that thereafter the sheik on horseback should pass over a carpet of human bodies. The sacred animal could only sanctify the faithful by the contact of its hoof. On the appointed day, every year, an immense crowd has been accustomed to assemble on the ground where the *Dosseh* is going to take place. English and other foreign tourists have been drawn frequently to the horrifying scene by curiosity. The frenzied devotees, often intoxicated with *hasheesh*, rush with low cries into the lane through which the horse is to pass, which has been kept clear by the police. They prostrate themselves in the way of the sheik as he sits on a splendid white horse, which half a dozen grooms are hardly able to hold. When the bit is let loose, he dashes across the animate pavement. After the sheik has passed, the fanatics, many of them crushed and wounded, disappear as if by enchantment.

ELECTRICITY, RECENT THEORIES OF. James Clerk Maxwell enunciated the theory that light is an electrical vibration. The theoretical ground for this theory is the explanation which the two states of electric energy, static and kinetic, afford of the vibratory motion of light. Electricity, when passing through conductors or revolving within the poles of a magnet, is a kinetic force, and when dammed back by an insulator is a static force existing in a state of strain. Light is a form of energy which alternates between the kinetic and the static forms. Its rapid motion through a transparent medium is only comparable to the rate at which electricity travels along a conductor. When it is known that the velocity of light is numerically equal to the calculated rate of the transmission of an electromagnetic wave-disturbance, as has been the-

oretically demonstrated by mathematicians, the connection between the two forms of energy, which are found also to touch each other at other points, and to interdepend in many respects, must naturally be supposed to be real and close. That the only known physical forces whose effects are transmitted through such wide media, and at such a high rate of motion, should possess precisely the same velocity constant proves that the phenomena can only be referred to the same source.

Professor Maxwell died before he was able to interpret the true relation between the two great groups of phenomena; but the certainty with which he established that they are the manifestations of one and the same force is the most valuable bequest left by that eminent theorist to the scientific world, which brings it to the threshold of a great advance in physical science. That light and electricity are related was first suspected by Faraday, who labored for years to establish his hypothesis. The only result which his many experiments yielded was the production of luminosity upon the surface of a dense kind of glass containing borate of lead, by exciting a powerful magnet, between whose poles a beam of polarized light had been projected upon the glass, and then interrupted. This experiment was first interpreted many years after by Maxwell and Sir William Thomson, and was the experimental basis of the Maxwellian theory. Many other transparent substances have been found to exhibit the same phenomenon in a less marked degree. A feeble luminosity has been discerned, even in common air, between the poles of a magnet similarly excited. Dr. Kerr has recently experimented in the same manner upon opaque bodies, and has shown that when light passes through a film of magnetized iron, thin enough to be translucent, its plane is rotated. The main fact which suggests an inseparable relation between light and electricity is the identical value of the velocity of light, which has often been measured, and of the constant, which expresses the rate at which a magnetic wave-disturbance would travel, which has been calculated from electric measurements. Maxwell's theory explains the fact noted above, that light transmitted through an active electric conductor must change its plane. It requires that insulators should be transparent, and conductors impervious to light. Even *ebonite*, the most opaque of electric insulators, has been shown by Graham Bell to be exceedingly transparent to some kinds of radiation. That the co-efficient of velocity of light in a transparent medium should depend upon its electric strain constant is a consequence of the theory. There are certain phenomena which, while showing an intimate connection between light and electricity, have not yet been explained in accordance with the theory. One of these is the remarkable effect of light in reducing the electric resistance of selenium, the light of a candle being sufficient to enhance

its conductive power fivefold. Another is the fact that light generates a current on striking the platinum electrode of a voltmeter.

In further confirmation of Maxwell's electromagnetic theory of light, it has been proved by the experiments of Helmholtz, Fitzgerald, and others, that Fresnel's calculations of the intensity of light, reflected and refracted at the surface of meeting of transparent media, agree with this hypothesis in connection with the one assumed as the explanation of the laws of double refraction.

Professor Sylvanus P. Thompson, Jamin, and other eminent physicists, have formed a conception of electricity which resembles the old belief that it is a fluid substance. Experiments appear to show that in its relations to energy and matter it only acts as a transmitter of energy, and is not convertible into it. The quantity of electricity within a closed surface, it has been demonstrated, can not be increased or diminished without the entrance or outflow of electricity. It is concluded, then, that electricity is a third entity, distinct from matter and from energy, the total quantity of which in the universe is conceived to be constant, as is the total quantity of matter or of energy. It resembles matter in that it requires the expenditure of energy to set it in motion, and, when its motion is arrested, its kinetic energy reappears in the form of heat or an equivalent form. The force with which a quantity of electricity acts upon another varies inversely as the square of the distance between them, as does the mutual attraction of bodies, but the effect is of the nature of repulsion instead of attraction. Electricity may be imagined to be a physical entity which does not possess mass, but yet possesses a quality corresponding to elasticity, and can be the recipient of energy in both the kinetic and the potential forms, and which tends to distribute itself equally throughout space, and exercises a definite pressure on those ultimate particles of matter which it does not penetrate. Under this supposition electricity would fulfill all the functions which are ascribed to the interstellar and intermolecular ether. The hypothesis of the imponderable ether of space may be abandoned in favor of the immaterial electricity which may be assumed to fill all space. Light would then be the vibrations of this elastic but imponderable medium. Heat, or the equivalent forms of energy, are the forms into which light vibrations of electricity change when the vibrations are arrested or absorbed, just as the vibration of matter, when arrested, changes into heat or its equivalents. But it is only the less refrangible rays—that is, the vibrations of greater wave-lengths—which nearly agree in period with the vibrations of molecules, and are convertible into calorific energy. The more rapid radiant vibrations, which produce actinic effects, do not expend their energy in thus intensifying molecular oscillations. Their electro-chemical action is explained by their

alternating displacements of the electricity of space in the surface molecules of a chemical compound which is decomposed by their action, at certain stages of which rapidly reversed electromotive action electrolysis occurs.

While the phenomena of radiant energy and the other problems which have led to the postulate of the hypothetical ether are satisfied by this theory of electricity, all electro-magnetic phenomena can be explained by the supposition of a constant tendency to the equalization of inequalities in the distribution of electricity. Electricity behaves like an incompressible fluid moving along stream-lines with the relative pressures and tensions between the various parts which would belong to such a fluid. A body which contains an excess of electricity or a deficiency as compared with neighboring bodies tends to transfer to them, or they to it, the quantity above or below the average charge. The two conditions of electrification known as positive or vitreous and negative or resinous consist, according to this hypothesis, of an excess or defect in the electricity contained in a body compared with the ordinary distribution. Which of these states is the surcharged condition has not been determined, though the weight of evidence indicates that it is that called negative and designated by the minus sign, the state of electrification which certainly tends more rapidly toward dissipation or discharge than does positive or vitreous electrification. The so-called minus, or, according to these conclusions, excessive or true plus electrification, is that possessed by the earth relatively to the surrounding space.

ELEMENTS, COMPOSITE NATURE OF THE. The spectroscopic studies of the materials of the sun, of the hotter and the cooler stars, and of the luminous nebulae, have led to the belief that most of the chemical elements, as they are known to us, are compound bodies; and that they are all resolvable, though the means of dissociating their components are beyond human reach, into a very few simple gases, or perhaps into one single ultimate form of matter. In accordance with the nebular hypothesis, which is strengthened by the probabilities of this new theory, the many forms of matter are assumed to have been progressively developed from their ultimate constituents by the changes in physical conditions through which the universe has passed, the condensation and refrigeration of the matter of which cooler heavenly bodies, exemplified by our earth, are composed. The reasons for assuming the elementary nature of the so-called elements are, that they resist all efforts to decompose them, and secondarily that they enter in definite proportions into chemical compounds. The property of chemical stability is manifested in many degrees. Many compound substances combine as radicles and show a close resemblance to the elements in their behavior in certain relations. The building up of homogeneous substances from materials which are themselves complex com-

pounds formed from the union of other compounds, is the usual manner in which the minerals of the earth's crust were formed. The metamorphic combinations through which the chemical constituents of organic substances pass are still more complex. Since the many thousand substances which are found on the earth have been resolved into a limited number of bodies, it may be expected that improved experimental methods will discover the compound character of some of them, and that perhaps whole groups of the present elements will give way to analytical experiments, as did the alkalis and earths which were regarded as primary substances at the beginning of this century. Nor, when the limited means which we possess for overcoming the cohesive force of molecules are considered, can it be taken for granted that any of the supposed elements possess the atomic constitution and physical properties of the substances which composed the solar universe when the solid bodies of the planets and the liquid mass of the sun were dissolved into one fiery, gaseous flux, whose molecular particles developed a heat in their collisions far beyond that of the sun.

Recent scientific speculation conjectures a cold nebular condition anterior to the luminous nebular period. It is supposed that, among the phases through which the stellar systems pass, may be one in which the gaseous matter is dispersed so widely in space that the flying molecules do not impinge upon each other with sufficient frequency to produce the manifestations of heat and light. In that condition the division of matter may have been finer, and its constitution more homogeneous, than when it was drawn together, in accordance with the most universal law which science has established—that of the mutual attraction of bodies—into closer contact. The elements whose existence seems to be best established in the hotter stars and the nebulae are the primary gases of the earth's surface—hydrogen, oxygen, nitrogen. Hydrogen seems to be present in all luminous bodies which have been examined with the spectroscope, where it occupies a position in the outer atmosphere. Nitrogen is the only other terrestrial substance whose presence in the nebulae is ascertained. It has not been detected in the solar spectrum, but this is probably owing to the difficulty of determining the composition of a fused mass enveloped in an atmosphere of incandescent gases. As it forms so large a proportion of the earth's atmosphere, it must be inferred from the nebular hypothesis that it exists in the central body, which constitutes nearly $\frac{2}{3}$ of the total mass of the solar system, unless it also be supposed to be one of the substances which have come into being during the process of cooling. Its presence in the incandescent nebulae, its gaseous nature, and its probable simple molecular constitution, indicated by its light atomic weight, render this an unlikely supposition. The recent discovery of oxygen in the sun illustrates the

difficulty of reading the solar spectrum, and strengthens the expectation of finding nitrogen and perhaps numerous other unobserved bodies in the sun.

The nebular spectra seem to be simpler than those of any of the solar bodies. Besides the two gases mentioned, the only other substance observed which projects a well-defined line is an unknown element whose spectrum resembles that of barium; but the proximity of its line to the barium line is supposed to be purely accidental. This, like the two known substances which have been identified in the nebulae, may be presumed to be a gas of light atomic weight, which preserves the gaseous form at exceedingly low temperatures. In the formation of the solar system from a diffused nebulous mass, the kinetic theory would require that the gaseous materials should rise in temperature as they are brought into closer and closer compass before condensing into liquid forms. The hypothesis is that the unknown substance which has been discovered in the nebulae, or substances if there are more such, was also represented in the solar system when in the nebular state; and that, when the gases were compressed more and more closely around the nuclear mass in obedience to the principle of gravitation, the rise of temperature which attended the process transformed these substances, while the other gases remained stable.

The theory was thus stated by Lester F. Ward in a meeting of the Philosophical Society of Washington: "Prior to the stage in the history of a nebula at which the degree of molar aggregation is sufficient to occasion a great amount of friction among the particles, the temperature of the primary molecular aggregates must be nearly that of space, and it can rise only as increase of density and molar motion increases that friction, and converts material motion into ethereal vibration. Nebulae must therefore possess a long history, of which neither the telescope nor the spectroscope can furnish any record—the pre-luminous period—in which, of course, no gases can exist except those, like hydrogen and nitrogen, which maintain their gaseous form under extremely low temperature. And it may be supposed that during this period other gases may exist associated with these, which, however, unlike them, are unable to sustain the successively higher and higher temperatures which the nebula acquires in its process of condensation and organization into a system, and at certain stages of this process are dissociated and resolved into aggregates of a different constitution, suited to these temperatures. Some of the latter new aggregates would naturally assume the liquid and solid forms at temperatures still high as compared with those to which we are accustomed, and constitute in the cooled-off crust of the planets the various metals and metalloids. In this manner we should have no difficulty in accounting for the

existence of all the elements found on the earth, even if it were positively known that only the lighter gases were present in the parent nebulae." This theory accounts for the presence in the nebulae of a substance not present in the solar system, which is assumed to have once passed through the same physical condition, associated with other substances which are indubitably abundant in the sun and its planets, and for many substances present in the earth, some of which have been detected in the sun and stars, and numerous others of which are probably contained in them, of which no traces are found in the nebular spectra. It also explains how these substances could have been derived from the nebular mass when their existence in a volatile state would necessitate a temperature far higher than can be supposed to have ever prevailed throughout the original nebula. Those elements which have the highest melting and volatilizing points are precisely those which have the greatest atomic weight, and are therefore the most likely to be of composite nature; while those which have the lowest combining numbers, and are therefore more likely to be simple substances, are those which have as a rule extremely low condensing points. Carbon, which, with an atomic weight of 12, assumes solid forms at ordinary temperatures, and mercury, which can be vaporized at a low temperature, while its combining number is in the new system 200, are the only exceptions to this rule. A law in experimental chemistry is, that the increase of mass in the formation of compound molecules is attended with a decrease of stability. Many of the metallic and metalloidal elements combine in larger molecular masses than are possessed by many compound substances. If they are the products of the metamorphosis of lost elementary substances at a time when the heat of the nascent solar system was greatest, they can not be expected to be resolved into their primary constituents by human means. Those of them which are found in the sun may be suspected to belong to this category. Those which are found only in the earth may be compounds formed at a lower temperature. Many molecules of hydrogen, or of nitrogen, carbon, or oxygen, might be contained in a molecule of gold, of platinum, or of lead.

It is consonant with the atomic theory to consider the stability of the elements as only relative. Even the molecule of hydrogen, which is taken as the standard and unit of molecular measurement, may be a superior form of atomic arrangement. There may be substances with minuter and simpler molecules which can not be appreciated by the senses, and do not respond to the physical law of attraction to a measurable extent. The imponderable interstellar ether is matter which is not visibly subject to the influence of gravitation. Possibly there exist atomic aggregates of still lower order. All known substances may have been evolved from antecedent forms

of matter. The process of evolution is seen to go on in all the known forms of matter, and the evolution of matter with an altered molecular constitution would naturally be supposed to have attended the other physical changes in the history of nebulae and their consolidation into planetary systems. The anomalous phenomena of ozone and antozone bring into question the absolute stability of the presumably simplest and most elementary substances. The unknown substance which gives out the green ray in the solar spectrum has been conjectured to be of simpler constitution than any of the terrestrial elements.

In the various homologous series of hydrocarbons the boiling-point of the compounds rises, and their specific gravity increases, with their molecular complexity or increase in molecular weight. The broadest and most securely established general law in chemistry is that substances with the lowest atomicity have the lowest melting-points and the simplest spectra, and that both these functions are in a general way proportional to the combining number of a substance. The hypothesis of variable molecular groupings under different conditions within the so-called elements explains many facts which are now anomalous. It accounts for the irregular vapor densities of some substances. The phenomenon of allotropism exhibited by various metalloids, which is most marked with those which have not been found in the sun, is thus explained. The allotropic substances exhibit complex spectra, and their spectra are often different for the different allotropic states. In passing from one allotropic condition to another, energy is invariably evolved or absorbed, which can only be accounted for on the supposition that it controls changes in the molecular disposition of the atoms. The phenomena of polymerism in organic substances can only be explained by the theory of the variability of constitution of substances known to us as primary. The spectrum of potassium varies exceedingly at different temperatures, and the spectra present a marked analogy to those of hydrocarbons evolved during fractional distillation.

The coincidence of some of the bright lines in the spectra belonging to different metals was first noticed by Kirchhoff. The brightest stars give only a few prominent lines, and these are the same as those which show bright in the spectrum of the solar disk. In Sirius there are only half a dozen well-marked lines. The cold stars, which give a feeble and reddish light, have fluted spectra instead of lines. The fluted spectrum of any substance gives place at higher temperatures to the line-spectrum characteristic of the same substance; and when the elevation of temperature is gradual, the bright lines of an element appear in the same way in which the lines of the constituents of a compound appear, instead of the spectrum of the compound when the latter is broken up. In the laborious spectrum

analyses conducted by Lockyer on the plan of comparing superimposed photographic images, and of eliminating impurities from the spectra studied, it was found in the case of iron, for example, that the fact of a line coinciding with one of some different substance was not an exception but the rule. In the region between 39 and 40, where scarcely any iron lines had before been observed, and only 5 lines in the solar spectrum, the photographic process revealed nearly 300 solar lines and 62 lines of iron, of which latter 44 corresponded in position to lines of other metals.

Lockyer's analytical study of the spectra of different parts of the sun proves that the lines of each substance are fewer and the spectrum much simpler in the hotter than in the cooler regions. The flames or prominences are taken to be outbursts from the interior, and to show the highest temperature that can be examined. The spots possess an intermediate degree of temperature between the storm-flames and the regions which are free from either spots or storms, and which are supposed to be the coolest. The lines of iron, for example, most prominent in the flames are very different from those which show thickest in the spots, and are much fewer. The spectrum of the spots, while varying greatly in the lines seen, is generally simpler than that even which is obtained in the electric spark. The spectra of the spots are not only much simpler than the sun's spectrum as a whole, and the flame-spectra than the spot-spectra, but totally different lines are projected at the transcendental temperatures of the flames. The cause of the difference in the lines is found in the changes observed in the refrangibility of lines due to variations of velocity in the movement of various solar vapors. Tacchini, when watching the two iron lines 4922.5 and 5016.5 in a solar storm, suddenly saw them both disappear, while two other entirely new lines made their appearance in their neighborhood and remained for several months. It is a natural inference that at the unusually intense temperature which then existed iron is decomposed. The lines of iron which are thickened in the spots, those which show bright in the flames, and those which are regarded as the basic lines of the metal, are almost without exception the same lines.

The latest theories of spectroscopy, according to which the line, the fluted, and the continuous spectra form a gradation whose stages indicate the greater or less aggregation of atoms in the molecules, are confirmed by proofs of various kinds. The three types of spectra are not separated by distinct boundaries, but merge into each other and form a continuously progressive series. Compound bodies never give a line-spectrum. Their spectra are either fluted bands or continuous. Some elementary bodies give continuous and fluted spectra at lower temperatures, and at high temperatures line-spectra. Their low-temperature bands can be determined by their absorption spectra,

which are the converse of their proper spectra, the rays absorbed by a body from transmitted light being the same which it emits when incandescent. The theoretical inference is, that the change from one kind of spectrum to another is due to a change in the mass of the individual molecules, their splitting up into smaller molecules or their concretion into larger ones. The absorption spectra of the vapors of iodine, bromine, and the metals silver, potassium, sodium, etc., show fluted bands. The spectra projected by the same substances when rendered luminous by a powerful electric spark are simple lines. The results of Victor Meyer and others, who have recently effected the dissociation of the halogens, and proved that iodine and bromine molecules do separate into smaller atomic aggregates at high temperatures, furnish an experimental confirmation of the theory that the different types of spectra show the relative complexity of the molecules. Sulphur-molecules are known by their chemical behavior to divide into three at the temperature of 1,000° centigrade; and in this condition they project a fluted spectrum instead of the ordinary continuous spectrum of sulphur.

ENGINEERING. On the American Continent and that of Europe some of the largest engineering works ever attempted are in progress, or are about to be begun. The Channel Tunnel from France to England, underneath the Straits of Dover, is the most formidable enterprise; and although large sums have been expended in the preliminary works, and the feasibility of the scheme is reasonably demonstrated, still the promoters may yet reconsider the probabilities of sufficient returns, and the project be again put off into the indefinite future, after a considerable portion of the work has been accomplished. The Arlberg Tunnel through the Alps is another of the gigantic bores through the heart of a mass of mountains which modern engineering makes possible and modern international commerce and intercourse render remunerative. As the mountain-barriers between Western Europe and Italy have been thus leveled, and as those which divide Switzerland and Austria will be leveled by this new tunnel, so it is proposed to pierce the Pyrenees and connect France and Spain by a railroad. The projected canal through the Isthmus of Corinth, a revival of a scheme which occupied the thoughts of engineers and rulers in ancient Greece, is not yet actually commenced, but is one of the newer projects conceived under conditions favorable to success. General Türr, the Hungarian patriot, has received a concession from the Greek Government for the execution of the design, and French engineers will be engaged in the work. The cutting of canals, broad and deep enough to float the largest iron steamships, through every narrow neck of land where such works will materially shorten the main ocean trade routes, is rendered desirable and profitable by

the extent to which the world's commerce has developed, and the conditions under which it is carried on. It needed only the assurance that engineering art is competent to construct a channel through which the tides can wash, and monster steamships float from one sea to another, to give rise to numerous projects of this kind, the advantages of which can be calculated with tolerable precision. The piercing of the Isthmus of Suez, the most necessary to be removed of these barriers, though not the most formidable one, furnished the needed example. Even in the far East a project for a ship-canal is taking shape. It is proposed to dig a canal through the Isthmus of Krai, the narrowest part of the Malayan Peninsula. Such a cutting would shorten the commercial route to China and Japan by more than six hundred miles. The isthmus is about fifty miles wide; but the route of the proposed canal is shortened by natural water-ways on both sides. By utilizing the bed of the Pakchan River on the western coast, and that of the Htassay on the eastern, the length of the cutting which would have to be made would probably not exceed thirty miles. The engineering difficulties are not great, as far as known. The neighboring region is fertile, and contains minerals of value, tin-mines being already established, and gold having been found in promising quantities.

The Arlberg Tunnel was a project of six or eight years' standing, and all the engineers of Austria had been called into counsel as to the best route, when a definite line was decided upon by the Government in 1880, and the work was finally begun. The only outlet for Austrian products has been either over the German lines or Italian lines of railway, so that in view of possible complications, and as a condition of political independence, it was necessary to construct this railway, at whatever cost. The success of the Mont Cenis and St. Gothard Tunnels has encouraged the Austrians to seek an independent outlet by boring through the mass of lofty mountains between Austria and Switzerland. The tunnel will be over six miles in length. It will be completed in about six years. The total cost of the railroad will be about \$18,000,000.

On the American Continent the Panama Ship-canal, which has been vigorously begun, overshadows all other engineering projects now under way. The scarcely less ambitious and more striking design of a ship-railway across the Isthmus of Tehuantepec has not yet been definitely undertaken; but the scheme is more seriously considered, and appears to have a better prospect of accomplishment, than at the time of its first promulgation. The Florida Ship-canal, the Chesapeake and Delaware Ship-canal, and the Cape Cod Ship-canal are the first projects for deep-draught canals which have a prospect of being constructed in the United States. Another ship-railway scheme has been broached as a substitute for the old project for joining the Bay of Fundy and Baie Verte

on the Gulf of St. Lawrence. A railway for conveying vessels eighteen miles across the Isthmus of Chignecto would save the long and dangerous voyage between ports of the United States and ports on the St. Lawrence Gulf and River, which must now be made around Nova Scotia. The Dominion Government has this plan under consideration.

Although in the United States no new canals of importance have been opened for many years, and the impression prevails that inland water communications are destined to be superseded by railroads, in several of the Continental countries of Europe the canal systems are being extended greatly at the present time. In Great Britain no new water-ways are under construction, and the existing ones are owned by the railroad companies, and made entirely tributary to the business of the railroads, even to the extent sometimes of abandoning their operation. Of 4,200 miles of inland navigation in Great Britain, fully 40 per cent have been purchased, leased, or subsidized by the railway companies. The most active country in the extension of water communications is Germany. The Government's plan for uniting by a system of canals the Elbe, the Weser, the Ems, the Rhine, and the Meuse, is maturing. The system, connecting with the canal systems of Belgium, France, and Holland, it is expected will be further expanded and joined to the canals of East Germany by a deep-draught canal which English capitalists have proposed to construct between Kiel and some point on the Elbe.

The Austrian Government is resolved to improve the navigation of the Danube. The opinion prevails in that country that the removal of the obstacles in the Danube would enable Austro-Hungary to compete successfully with America in supplying Europe with grain. The rocks which are called the Iron Gates are to be destroyed by blasting, and rocky obstructions are to be cleared away in the channel of the upper Danube. The Bavarian and Württemberg Governments show a willingness to co-operate with the Austrian, and so improve the river that barges can be towed throughout its whole course. The project of connecting the Danube with the Oder by a canal, which will enable the cereals of Austro-Hungary to be transported to the Baltic, is likewise a favorite one at Vienna. The scheme of digging a canal between the Dniester and the Vistula, and thus establishing a commercial highway between the Baltic and the Black Sea, is favorably entertained by Central European capitalists. The products of the South Russian grain-regions could then be conveyed directly from Odessa to Dantzic, and shipped by way of the North Sea. The estimated cost of such a water-way is \$100,000,000.

In France, Freycinet, when Minister of Public Works, instituted inquiries which led to the conclusion that in that country the business of transportation could be done by water-routes at from one third to two fifths the cost of rail-

road conveyance. On the strength of this information the French Government resolved on the gradual improvement of harbors, rivers, and canals, the total expenditure determined on for this object being \$200,000,000. The scheme of a ship-canal, connecting the Atlantic and the Mediterranean, to save the long and perilous voyage around the Spanish Peninsula, is still under consideration, and has good prospects of being adopted.

The Dutch have been stimulated, by the deflection of the Rhine-trade to Antwerp, to improve and expand their canal system, which has been for centuries the world's model. The States-General of Holland recently voted \$1,250,000 for improving the canal from Rotterdam to the sea, and decided to cut a new canal from Amsterdam to Utrecht, and thence to the Merwede River, near Gorcum. The citizens of Amsterdam propose to construct another one between their city and the Waal, through the Guelon Valley. The Belgians are not disposed to yield up the prize without a contest. The canal at Charleroi is being widened, and a large central canal is to be dug through the whole breadth of the country. The Government is attempting to establish uniformity of gauge in the canals of Belgium.

The great suspension-bridge across the East River, in New York, is nearing completion. The year has seen the approaches substantially finished and the work on the superstructure begun. Nearly all the floor-beams were laid before the close of 1881. The original plans were materially changed during the year, making the bridge five feet wider and four feet higher above the river, with greatly increased strength, to enable it to carry railway-trains of Pullman cars.

The tunnel under the Hudson is progressing rapidly and securely by improved methods, work going on from both shores. Steady progress has also been made in the excavations under Hell Gate for the removal of Flood Rock. Safety in the navigation of New York Harbor and adjacent waters has been largely enhanced during the year by the introduction of iron-hulled passenger and excursion steamers.

The renewal of the suspension-bridge at Niagara is a remarkable feat of engineering skill, as all the parts of the structure were removed and replaced with new, except the cables, which were repaired at the shore-ends, and a new anchorage was made, without any interruption of the railroad traffic. The fact that, after twenty-five years of use, the wire cables and suspenders of this gigantic span were found but very slightly impaired, is a gratifying proof of the security and durability of this type of structure. In 1877 Thomas F. Clarke examined a portion of the strands imbedded in the masonry, and found a few wires corroded. W. H. Paine shortly afterward instituted a more thorough investigation. Tests of the elongation of the cables under a given

moving load, and tests of single wires for tensile strength and ductility, were satisfactory. The strands were cleaned, freed from the wire bands, and opened, with the result of finding them as good as new, with the exception of the outer wires of the outside strands. As the shores were approached only the strands underneath were found to be affected. It was seen that the corrosion was due to the fact that the elongation and contraction of the strands under passing loads had loosened the cement from the outside strands, and allowed moisture to enter. The defective wires were cut out and new ones spliced in. The greatest number replaced at one end of any one cable was 65, the total number comprising each cable being 3,640. The examining commission recommended that the anchorages be re-enforced and that the iron superstructure of the bridge be renewed, and reported that the action of the cables indicated that they were in perfect condition. In the plan which was executed for the strengthening of the anchorages, one anchor-plate in each pit is made to answer for all the four new chains which were fastened, in addition to the old anchor-chains, two to the end of each cable. The new pit is beyond the two old anchorages, at the back of the old wall. The new anchor-chains connected with the upper cables pass in long links in a straight line from the point where they curve down to the anchor-plate to the end of the cables. The chains fastened to the lower cables pass from the same point, in still longer links, on each side of the old anchor-chains of the upper cable to the old lower cable anchorage, where they have to make an upward bend to join the end of the cables. This is secured by fastening the pins of the short links, which succeed to the pins of the old anchor-chain, by stirrups. The pits are 6 feet by 2 feet 6 inches. The anchor-plates are of cast-iron, 5 feet 6 inches square, and strongly ribbed. One pin passes through the plate and the whole eight links of the anchor-chains. The pits were sunk 17 feet deep on the New York side and 23 feet on the Canada side. The chamber for the reception of the plate at the bottom of the pits was 6 feet by 7. In filling up the pits no stone was permitted to come in contact with the chains. In renewing the iron-work of the superstructure, it was decided to use steel for the posts, chords, track-stringers, and lateral rods, and to make all other parts of iron. The new iron beams were first put in nearly throughout. The portion of the new work thus put in weighed 1,100 pounds per running foot. There were 150 feet of the new work finished at a time, which was equivalent, in the middle portions of the bridge, where the work was begun, to about 70 tons of extra dead load on the bridge. The weight of the wooden portions of the old bridge was estimated by John A. Roebling, at the time of completion, at 1,000 tons. Added wood-work and absorbed moisture are estimated to

have increased the weight to 1,228 tons. The new wooden structure, which has replaced it, is estimated to weigh 1,050 tons. A device is applied in the new superstructure for the automatic regulation of the continuous iron truss which is required to render the stays from the tops of the towers to the floors effective. It is necessary that the different points of this truss should remain as nearly as possible absolutely in the same position. The automatic adjustment by which the middle point of the continuous truss is kept from shifting at any moment toward either end, is effected by means of an iron rod stretching along the lower chord from one end of the bridge to the other. The rod is attached at each end to the short arm of a bent lever, at the other arm of which is suspended a narrow wedge. The wedge is held between the end of the chord and the abutment. The iron rod has the same measure of expansion and contraction as the chord, and the lever is so constructed that the wedge will be raised or lowered by the pressure or relaxation of the rod at each change in temperature, so that it will just fit in the space between the abutment and the chord of the truss, thus keeping the center of the truss absolutely stationary and the chord constantly rigid, while leaving full play for the elongations and contractions caused by changes in temperature.

A new iron light-house in Chesapeake Bay, off Cape Henry, is one of the finest structures of the kind. From base to top the height is 155 feet, the diameter at the base 30 feet, and at top 16 feet. There are six stories before reaching the service, watch, and lantern rooms and the roof. The total weight of materials is 1,700,000 pounds, 7,000 pounds of bolts being used in joining the parts. The structure has an octagonal frame of cast-iron and an interior of sheet-iron, cylindrical in shape. The castings of the base and first story are 2 inches in thickness. The sheet-iron lining is $\frac{3}{8}$ inch thick. The iron staircase goes around the cylinder. The light-chamber is a circular steel frame 12 feet in diameter and 9 feet high. The different stories are bolted together through the cast-iron floor-plates, which are $1\frac{1}{2}$ inch thick.

A larger proportion of the ships built on the Clyde in 1881 were made of steel than in former years. The year was one of remarkable activity. No fewer than 261 vessels were launched, with an aggregate capacity of 341,022 tons. In 1880, which showed the largest construction of any year since 1874, the tonnage reached 248,800. The number of contracts on hand gave indications of a still larger construction in 1882.

Professor Raoul Pietet, of Geneva, has been experimenting on an improved model for naval construction. He has worked out a design which differs essentially from the present type of hull, and which in the model promises performances in speed far better than the best-

designed vessels are now capable of showing. He expects to attain a speed of thirty to thirty-six miles an hour. The advantage consists in such an arrangement of the keel as to diminish the resistance of the water to the lowest point. As the speed increases, the prow rises up, and only the sides of the hull and the portion in the vicinity of the wheel are subject to friction, so that the ship will glide over the water, instead of having to push its way through the water.

A new system of mountain-railroad has been invented by a French engineer, M. L. Edoux. It is being employed to establish communication between the watering-place of Cauterets and the baths of La Raillère, whose hot sulphur-springs are much visited by invalids. The springs are not quite a mile distant from Cauterets, and four hundred feet higher. The principle of the hydraulic elevator which is used in buildings is utilized, a mountain cataract furnishing the motive power. The car conveying the passengers is raised by five hydraulic elevators placed in towers some forty yards apart, each separate lift being eighty-four vertical feet. The top of each tower is a little higher than the foot of the next one, with which it is connected by an inclined bridge, along which the car is carried by gravity to the platform of the next elevator. The car descends to the station from the top of the highest tower, stopping on a platform which transfers it to the return-track by an automatic arrangement controlled by a hydraulic piston. The downward track winds around the side of the mountain at a very slight inclination, and ends at the second tower from the foot. The last two stages the car descends by means of elevators in the two lower towers and a connecting inclined track.

The inclined railway at the Giessbach, on the Lake of Brienz in Switzerland, is an application of the water-balance system. A descending carriage is made to draw up a second loaded one by means of a steel-wire rope connecting the two and passing over a reversing pulley at the summit, and of an excess of weight obtained from a load of water carried in a cistern in the under-frame. The length of the line is 1,100 feet, the height of the lift 303 feet, the average gradient 28 in 100. The car can carry forty passengers and luggage. It is provided with a toothed wheel and safety-drum. There is but one track, with double rails at the crossing point, the cars being able to turn out without switching from the fact that the wheels of one are flanged on the inside, and those of the other on the outside, of the rail. The weight of the car empty is 5.3 tons; loaded, it is from 6 to 9 $\frac{1}{2}$ tons, demanding a counterpoise of from 7.3 to 10.8 tons, requiring from 1.6 to 5.8 tons of water in the cistern. The maximum speed allowed by the charter is only one metre per second. About one half of its length the track is carried on a wrought-iron bridge of arched trusses.

A plan has been adopted for a circular elevated railroad around the city of Vienna, to pass through all the suburbs and to connect with all the railroads entering Vienna. This will transform Vienna from the most deficient capital in Europe in facilities for local transit to one of the best-appointed cities in the world in this regard. Such a scheme can be carried out with less destruction of property in Vienna than in any other city. It will pass nearly the entire way through waste lands on the bank of the Danube Canal and the river Wien, and the long strip of common along the projected Gürtelstrasse Boulevard. The remaining portion passes through one of the old and squalid quarters of the city. The Franz Josef's Quai Park on the bank of the Danube Canal is chosen as the site of the central station. This is in the very center of the business part of the city. All the other stations are located with reference to street-traffic and the main arteries of circulation. Along the canal the line is carried over ground which is now unoccupied, on an elevated structure which is so high that the approaches to the bridges are in no way interfered with. It crosses the Stubenring on an ornamental viaduct to the left side of the river Wien. As far as the slaughter-house on the opposite side of the city from the central station the road is elevated throughout. Beyond that point it makes a sharp turn, and enters a cutting in the common-land of the Gürtelstrasse. Farther on it alternates between viaducts and cuttings, until near the Lunatic Asylum it is carried through a tunnel about 1,500 feet long. It then proceeds through an open cutting with retaining walls until it leaves the route of the Gürtelstrasse and enters the walls of the city again near the central station. The total length of the proposed Ring Railway is 12·844 kilometres, of which 7·572 is on viaducts supported by iron columns, 0·816 on masonry viaduct, 3·243 in cutting with retaining walls, 0·470 in bank with retaining walls, 0·449 in tunnel, 0·085 in covered cutting, and 0·209 on the level. There are in the plan 19 stations, of which 15 are elevated and 4 sunk. The line is to be double throughout. Branches are to be constructed to form junctions with all the railroad lines which converge at Vienna. The total length of the main circuit and branches together is about 28½ kilometres, or 17½ miles. In accordance with this plan, every railroad terminating at Vienna will be brought into communication, not only with the central station but with all the other railroads. It will give to each railroad, in addition to its own terminus, 19 stations in the circumference of the city. The present facilities for reaching Vienna by rail are inconvenient in the extreme, but this plan would render them superior to those of any other city. Every part of the city will in like manner be connected with all the other districts and with the railroads. The importance of the connection of the capital by this means with every railway in Austria from

a strategical point of view has commended the scheme especially to the military authorities. The maximum gradient is one in 60, the minimum radius 200 metres. In the neighborhood of the Danube Canal and the river Wien costly foundations will be necessary. It is proposed, where the foundations will be entirely hidden under the surface, to sink shafts, timber them inside, and fill them up with *béton*. The Stubenring and the approaches to the Tegethoff, Schwarzenberg, and Elizabeth bridges are crossed by ornamental viaducts in which the main girders are concealed by light cast-iron arches, so as to render the crossing of such important streets rather an architectural improvement than a blemish on the beauty of the city. The main span of the Stubenring viaduct is 80 feet, the height above the roadway 16 feet 10 inches.

The work on the Arlberg Tunnel is proceeding at a more rapid rate than was attained on the Mont Cenis or St. Gothard. The former was bored at the rate of 1,112 metres a year, the latter at the rate of 1,670, whereas the Arlberg is expected to be pierced at the rate of 2,160 metres a year. The cost as well as the speed of mountain tunneling has been affected by improvements in engineering. Owing to the technical advances, but in a large measure also to the comparative shortness of the bore, the cost per lineal metre of the Arlberg Tunnel is estimated at only \$750, while the St. Gothard cost \$1,250, and the Mont Cenis \$2,000. On the Austrian side the same method of drilling employed in the other tunnels is used. The perforators drill twenty to twenty-five holes at one time, each 1½ to 2 metres deep. They cover a space of seven square metres. With each blast the tunnel is lengthened 1½ metre. The perforators move forward on wheels. The drills work with quick strokes, the impulse being imparted by compressed air at a pressure of five atmospheres, supplied through flexible tubes. The air is compressed by means of turbine water-wheels at the end of the tunnel. On the west side of the tunnel a new kind of perforator is being tried. The drills have each a diameter of 2½ inches. They pierce the rock with a rotary action given them by means of a water pressure of from 60 to 100 atmospheres. These perforators, with six or eight drills, accomplish equal results with lighter charges of dynamite as the pneumatic perforators with their twenty-five or thirty chisels. After each blast the loosened material must be removed. The work of taking away the excavated material is of equal magnitude as that of boring the rock, and consumes as much time. The smoke of the explosion in the unventilated space makes it a difficult and dangerous task to remove the rubbish after each blast. The miners in the Arlberg have found that they can neutralize the ill effects of the poisonous air to a considerable extent by covering their mouths and nostrils with sponges steeped in vinegar. The work on the Arlberg Tunnel was commenced in June, 1880. By July, 1881, the cast gallery

had been driven 1,010 metres, and the one on the west side of the mountain 710 metres. The tunnel is expected to be completed in five years from the commencement of the work.

The ventilation of long tunnels is a problem with which engineers have not yet dealt successfully. The natural mode of ventilation is the outflow of the warm air at the higher opening of the tunnel, and the inflow of cool air to supply its place at the other mouth. As the air within the tunnel is always warmer than the external atmosphere, natural ventilation takes place continually. Differences of temperature, of atmospheric pressure and moisture, and the direction of the prevailing wind, may increase the natural ventilation, or they may impede. A tunnel might be made with a sufficient difference of level at the two ends to insure complete ventilation, were it not that steepening the grade would necessitate the generation of more smoke, and thus aggravate the principal evil which it is sought to remedy. The ventilation of the Mont Cenis Tunnel is most imperfect, because unfavorable natural conditions of the external atmosphere almost neutralize the natural draught, notwithstanding the great difference of level at the two extremities, which is nearly 460 feet. The clouds of smoke which the engines leave in the tunnel roll backward and forward. The mechanical means which are employed to expel them are incapable of securing an effective ventilation. The air-compressing machines barely drive a current as far as the refuge-chamber sufficient to clear it of smoke; and the apparatus tried for pumping out the vitiated air has proved a comparative failure. The natural process of ventilation may be accelerated by either rarefying the air at the upper end of the tunnel, or by condensing it at the other. An artificial method of rarefying the air in the tunnel at the end where the current finds its natural egress has often been tried. Shafts are sunk into the tunnel at each end, and fires are kept burning to heat the air in one shaft, and thus cause an in-draught of fresh air through the other. One objection to this method for long Alpine tunnels is the expense of the apparatus and fuel when it is employed on such a large scale. Another objection is that the radiation of heat from the walls of the tunnel is so great as to render it desirable that the air should not only be renewed, but that it should be as cold as possible. The plan of cooling the air in the other shaft has not yet been tried. Wilhelm Pressel advocates employing this method instead of the other. He proposes to cool the air in one of the shafts by means of falling water. Mountain-streams of icy temperature are always accessible at the approaches of Alpine tunnels. He believes that a fall of about one hundred gallons a second through the shaft would cool the air sufficiently, and create a difference of temperature between the shafts sufficient to establish a current. A difference of 10° centigrade, he

thinks, would effect this object. The mouths of the tunnel and the openings of the shafts would have to be closed at will sufficiently to prevent the disturbing effects of wind on the ventilation. In cold weather the artificial refrigeration would be unnecessary.

The spiral tunnel at Leggestein, completed in the spring, was the first made and the principal one of a number of tunnels of the kind to be bored on the St. Gothard Railway. The plan adopted for the roads leading to the entrances of the great bore was to follow as far as possible the windings of the valleys of the Reuss, on the north side, and of the Ticino, on the south side of the mountain. This scheme of keeping in the valley-bottoms rendered it necessary to carry the line through considerable vertical distances by means of spiral tunnels, in which the gradient is steep and the curve sharp. The Leggestein Tunnel has a gradient of 23 in 1,000, and describes a curve of 300 metres. After leaving the tunnel, the railroad winds around the mountain, passing through a shorter tunnel above. The work of tunneling was exceedingly difficult, as the rock was hard granite, and, owing to the entire absence of water, the boring had to be done by hand. There are two other tunnels of this kind being bored in the Reuss Valley, that of Wellington, which is also bored by hand, and that of Pfaffensburg, each of which is 1,000 metres long. On the Ticino side there are four of these spiral or turn tunnels, from 1,500 to 1,600 metres in length.

The first passenger-train passed through the St. Gothard Tunnel on November 1st; time, fifty minutes. The tunnel exceeds the Mont Cenis Tunnel in length by 8,856 feet, being 9½ miles long. Goeschenen, the northern end, is elevated 3,637½ feet above the sea-level. The tunnel ascends in a gradient of 1 in 171 for 24,600 feet, and then 1 in 1,000 for 4,428 to the highest point, 3,785 feet above the sea. It keeps this level for 1,279 feet, and then descends with a gradient of 1 in 200 for 3,870 feet, and 1 in 500 for 13,792 feet. The station at Airolo is 3,755 feet above the level of the sea. The normal width of the tunnel is 24 feet 11⅜ inches at the level of the rails, and 26 feet 3 inches, 6½ feet above. The height is 20 feet. The roof is semicircular. The floor slopes with a fall of 2½ per cent from each side to a drain 27½ inches deep in the center. The line has also 52 subsidiary tunnels which, with the main tunnel, have an aggregate length of sixteen miles. There are 64 bridges and viaducts whose combined length form one per cent of the length of the line, while 17 per cent is taken up by the tunnels. The main tunnel is laid with two tracks of 4 feet 8½ inches gauge.

The experimental works on the British Channel Tunnel have proved satisfactory. Two shafts were sunk on the English side, one at Abbot's Cliff, and one at Shakespeare Cliff. From the first a gallery was driven by ma-

chinery, 800 to 900 yards long, and seven feet in diameter. The machines were susceptible of improvement; yet they were already capable of boring sixty-seven yards in a week, at which rate two galleries, seven feet in diameter, could be made to meet in the middle in five years. From the bottom of the Shakespeare Cliff shaft, 155 feet below the surface, another well was sunk 106 feet deeper, passing through the old gray chalk and into the Galt clay, without finding any trace of water. On the French side also two shafts were sunk, and the same favorable results were obtained. The machine with which the tunnel can be bored through the chalk at a much swifter rate than by the ordinary appliances, and which permits the startling project to be entertained as a mercantile venture, is the joint property and invention of Captain English, Colonel Beaumont, and Mr. Pigon. The Southeastern Railway Company, which has contributed the funds for the trial-drift on the English side, has agreed with the French projectors that the trial-work should be extended one mile under the channel from each shore, the headings to be of the same section, seven feet.

The two main headings of the Severn Tunnel, which is being constructed under the bed of the Severn by the Great Western Railway Company, were successfully united, September 26th, after serious difficulties. Both headings filled with water in 1879. The one on the Monmouthshire side was closed up by masses of the loose sandstone through which it passes. The fragments of rock were driven in by water from the adjacent hills which flooded the works. This heading has been bored 11,000 feet from the bottom of a shaft 180 feet deep, and meets the other with only three inches of deviation, although the vibration of the pumps, which had to be kept constantly going, interfered with the fixing of plumb-lines. The headings are seven feet high and seven feet wide. The tunnel will be enlarged to the width of thirty feet, and to a proportional height.

The ancient aqueduct built in the time of the Emperor Augustus, to supply Bologna with water, has been restored through the efforts of Count Gozzadini, and was reopened June 5th. The Roman engineers tapped the Setta near its junction with the Reno, about eleven miles from Bologna, and brought the water to the city in a tunnel running along the banks of the Reno, underneath the hills, and under the beds of the torrential mountain-streams which flow into the river. The tunnel was injured only in the places where the streams had worn down their channels, carrying away the masonry under their old beds, and where the Reno had washed away its clay banks as far back as the tunnel, taking away portions of the aqueduct. The greater part of the aqueduct, when examined before 1864, was found as good as when first constructed. The masonry was as solid as rock. It was of stone and brick, cemented with lime and volcanic sand. The work

of restoration has occupied many years, and has been executed with a skill and thoroughness calculated to make the new work as firm and durable as the old.

A method of destroying garbage by fire has been practiced in Leeds, Blackburn, Warrington, Derby, and other English towns, proving eminently satisfactory, especially in Leeds, which has led the way in these improvements. At Burmantofts, two miles from the center of the city, a six-celled destructor and a carbonizer were erected. The chambers of the destructor, as it is called, were built in brick, lined with fire-brick, and braced together with iron rods. The destructor occupies a space of twenty-two by twenty-four feet, and is twelve feet in height. An inclined road leads down to the top, and another incline from the level of the firing floor to the public road. Each cell is capable of destroying or carbonizing seven tons of refuse in twenty-four hours. The cells consist of a sloping furnace, with hearth and fire-gate covered by a reverberatory arch of fire-brick, with one opening for the admission of refuse, another for the escape of the gases, and a furnace-door for the removal of clinkers. The refuse is emptied on the platform, and shoveled into the cell, falling first on the incline, thence reaching the sloping hearth, whence, when sufficiently dry, it is pushed on to the fire, where, owing to the radiant heat of the firebrick arch, it burns fiercely, the products of combustion being gases, a fine ash, and clinkers. Every cell is provided with an opening large enough to take in infected bedding, diseased meat, etc. The gaseous products of combustion pass through a flue to a boiler, which supplies steam to a horizontal engine driving two mortar-mills. In these mills the clinkers are mixed with lime, and ground into an excellent mortar, which sells readily at five shillings a load; while the tin cans and iron are sold for old metal. No fuel of any kind is required, the cinders and other combustibles found in the refuse supplying all that is needed. The carbonizer is used to convert street refuse and vegetable matter into a charcoal, which sells at the rate of thirty shillings a ton. It consists of a group of brick cells, each having a separate furnace. It is twenty-six feet long, twelve feet wide, and fifteen feet six inches high. The chute is fitted with sloping plates, which project from its sides, and form a kind of spiral ledge, which, near the bottom of the cell, takes the form of a fire-block, resting on a wall which divides the contents of the cell from the gases of the fire. The vegetable and other refuse to be converted into charcoal is filled into this chute in a solid mass, the eaves or ledges forming on their under-side a flue, so that the matter is gradually heated as it slips down the well, until, at the bottom, it is surrounded by nearly red-hot fire-brick. The charcoal is withdrawn at the bottom, and is placed in a cooler worked by the steam-engine, and each cell is capable of treating two tons and a half

of vegetable and street refuse in twenty-four hours.

A design for a steam tug-boat for canals, which has been proved by trials on the Saar coal-canal to be free from the objections to the use of steam in narrow canals, is the invention of Paul Jaequel, of Natzweiler, in Alsace. Steamboats have proved useless on ordinary canals, because the waves which are generated by the screws or paddles injure the banks, and for the reasons that the boats are liable to injury in passing through locks, and that they can not carry sufficient cargo to pay expenses. In Jaequel's system of tug-boats the screw is placed in the body of the boat, and is surrounded by a cylindrical casing which receives almost the entire force of the wash, the water passing out astern in a stream so concentrated in direction that the banks are preserved. The water is fed in through two large channels leading from the sides of the boat. The screw itself in its sheltered position is safe from injury. The boat being a tug, and always drawing the same depth of water, can transport a large train of barges at three or four times the speed obtained from horses. The tug being steered by its own rudder, the use of steering-poles, which are very detrimental to the banks, is avoided.

The removal of Flood Rock, a large reef in the middle of the swift and narrow channel entering New York Harbor from Long Island Sound, is the most important of the Hell-Gate improvements, executed at the cost of the Government, under the plans and directions of General Newton. Flood Rock is a ledge of gneiss of similar composition to Hallet's Point Reef, which was cleared away by undermining it and leveling the remaining portions by a single explosion, which took place September 24, 1876 (see "Annual Cyclopædia" for that year). The work on Flood Rock was begun in 1876, but suspended for lack of appropriations during the year 1878, with which intermission it has been prosecuted continuously. The summit of the reef was at all times above water, although only a small portion was visible. By raising upon it retaining walls and cribs, an area of about a quarter of an acre was built up above high water, which afforded a suitable foundation for the buildings and a hoisting-tower at the opening of the shaft. This was sunk from the apex of the ledge to a depth of about 75 feet. The rock which was removed at the mouth of the shaft was utilized at first to fill a deep hole along shore, and then dumped between Little and Great Mill Rocks, a space 800 feet in length, in order to constitute with them the western jetty which will confine the new channel to be formed by the removal of Flood Rock.

The plan of the excavation is the same as that pursued in the leveling of Hallet's Point. The net-work of galleries and cross-galleries covers five acres. Piers, only sufficient in size and number to support the roof of rock which remains, will be left when the mining opera-

tions are over. These piers will then be drilled and filled with a sufficient quantity of explosives, and the whole mine will be fired simultaneously. The equivalent of 100,000 pounds of nitro-glycerine will be employed in the explosion, according to the original estimate. After dredging away a portion of the *débrie* it is expected that a channel 26 feet deep, at low water, will be obtained. The length of the galleries completed at Flood Rock at the end of the fiscal year was 13,528 feet; the quantity of rock removed, 39,608 cubic yards. The mining is expected to be completed at the end of the season of 1883. A considerable proportion of the labor of mining is performed by steam machinery, the most approved modern appliances being employed. The four large boilers on the reef can develop 400 horse-power. They furnish steam to five upright air-compressors, which supply air at a pressure of 55 pounds on a square inch to 30 drilling-machines, as well as to the winding-engine, a ventilating-engine, a shop-engine, two mining-pumps, and other machinery. The length of galleries driven during the fiscal year 1880-'81 was 6,211 lineal feet, and the stone removed amounted to 21,528 cubic yards. During the year 9,823 tons of stone were dredged from Hallet's Point, making the total quantity removed since the explosion 81,907 tons. Over two thirds of the area formerly occupied by this reef, the required depth of 26 feet has been obtained. In the remaining one third there are still places where the depth is not over 19 or 20 feet at low tide. The estimated cost of the remaining works at Hell Gate is \$2,250,000. This comprises the completion of the work at Flood Reef, the removal of Heel-Tap and the North Brother reefs, and excavations on Frying-Pan Rock. From Buttermilk Channel, between Governor's Island, in the harbor, and the Brooklyn shore, which was obstructed by a large shoal, with a minimum depth of 9½ feet at mean low water, about 80,000 cubic yards have been dredged.

The Madras breakwater, constructed of *béton* blocks of 27 tons' weight, was subjected to the force of a cyclone on the 12th of November; about 700 feet of each pier was entirely destroyed, and the topmost tier of blocks throughout their entire length was carried away. The failure of the Parkes plan of construction, under the action of a storm which was not more than half as violent as the one which struck the same shores in 1872, will probably lead to the entire rebuilding of the harbor-works. The 27-ton blocks were swept away like shells. The only part of the works which can be utilized in the reconstruction is the rubble mounds. The blocks of the Colombo breakwater, designed by Sir John Coode, are 50 tons in weight, the piers are half as wide again as those at Madras, and, what is most important, the blocks are set or bonded each nearly one half its length over the neighboring block, and this wall has five joggle

holes running from top to bottom. Parkes pronounced the usual practice of bonding unnecessary, and also placed his blocks on the edge, instead of choosing a broad form and laying them flat, thus exposing as little surface as possible in proportion to the weight to the lateral force of the waves.

In the first excavations for the Panama Canal, at Emparador, the nature of the ground was found to be much more favorable than was assumed in the plans. In making the engineers' estimates it was supposed that a stratum of hard rock would be found underlying the soil at a depth of about 12 feet along the route of the canal. In the first borings the instrument descended to the depth of 37 feet without striking any rock, and then, after penetrating a layer of rock only 6 feet thick, went down to the depth of 64 feet without encountering anything but a mixture of clay and soft stone. The route of the canal from one side of the isthmus to the other has been cleared of trees and other obstructions to the width of from 60 to 90 feet, and 125 miles of paths branching out from the canal route have been constructed. The climate has proved terribly fatal to the skilled workmen and superintendents brought from Europe. The work of excavation was stopped during the rainy season and resumed in October. It has been ascertained that no rock excavations will be necessary between Colon and Lion Hill. At the latter station the steam sounding apparatus showed that the excavation will be in soft clay layers formed by the degradation of a greenish pyroxenic rock. At other places the soundings have revealed to the depth of 80 feet a succession of derived rocks growing softer and softer. The mellow soil has also been found unexpectedly deep along the route.

The work of reclaiming the swamp and overflowed lands surrounding and extending south of Lake Okechobee, opening to cultivation a tract covering 17,000 square miles of the area of Florida, has been undertaken by a combination of Philadelphia capitalists. The State has entered into a contract by which one half of the 8,000,000 acres to be redeemed will become the property of the company. This tract embraces every class of Florida soil, much of it being admirable sugar-land, and contains valuable deposits of hematite ore and marl. Lake Okechobee covers an area of 1,000 square miles. The main feeder of the lake is the Kissimmee River, which discharges 207,360,000 cubic feet of water per diem. The rate of evaporation is one third in excess of the inflow, so that for eight months of the year a large portion of the lake-bed is dry. During the four rainy months the water overflows vast tracts of the surrounding country. The plan of reclamation is to construct a drainage-canal 21 miles in length and 44 feet wide, to the St. Lucie River. The canal is to have a fall of 1 foot a mile, giving a calculated velocity of $2\frac{3}{4}$ miles an hour, and discharging 733,709,800 cubic feet a day. The

plan is similar to the one proposed to the national Government by Colonel Meigs in 1879. The level of the lake is 25 feet above mean low tide. The artificial outlet will greatly diminish its area. In addition to this canal it is proposed to dig another to the Caloosahatchie River, which flows into the Gulf of Mexico, to deepen and straighten the streams which empty into the lake, and to dig lateral drains, and tap the ridges separating the sawgrass from the Atlantic and from the Gulf, thus draining all the extensive tracts of worthless land in that section. The work on the principal canal has been commenced. It is done by steam-dredges, two working side by side and excavating the entire cut as they proceed. They are constructed on the continuous-ladder principle, working like the buckets in a grain-elevator. The quantity of earth to be removed in the main drainage-canal is estimated at 9,000,000 cubic yards. The excavation will cost, according to the estimate of Menge, the designer of the dredges, only two cents a cubic yard.

ENGINES, SOLAR. French physicists have addressed themselves with encouraging experimental results to the utilization of the sun's heat for generating the steam to work mechanical motors. If only a minute fraction of the radiant energy of the sun intercepted by the earth could be directly utilized, it would furnish a superabundant supply of mechanical power for all of man's requirements. When the coal-beds, which represent stored-up energy derived from the sun and preserved from a former geological period, have been exhausted, there remains, so far as science is able to predict, no other abundant chemical source of energy. The current supply of solar heat must then be depended upon. The terrestrial forces of wind and water power, into which a portion of the intercepted radiant energy is converted, will probably remain to the end of time the natural agencies upon which the world must rely for the chief part of its mechanical work. In those parts of the earth's surface upon which the direct rays of the sun beat without remission through the whole year, their heating effect can be converted into mechanical power by means of mechanism of sufficiently neat construction and delicate adjustment. The heat of the sun on the earth is estimated to be equivalent to the melting of a crust of ice 103 feet thick, covering the whole surface of the globe, each year. The greater part of this heat is absorbed by the atmosphere. The average heating effect of the sun's rays, at the level of the ground within the tropics, is estimated to be enough to melt a layer of ice 85 feet in thickness. If the heat falling upon one acre could be entirely utilized in producing motive power, it would give 4,000 horse-power for nine hours a day throughout the year.

Mouchot has experimented many years upon the utilization of the sun's heat as a source of

power for operations requiring an elevated temperature. With mirrors of 80 centimetres diameter, he obtains 400° or 500° centigrade of heat, sufficient for the calcination of alum, the preparation of benzoic acid, the sublimation of sulphur, the distillation of sulphuric acid, for concentrating sirups, refining linseed-oil, making charcoal in closed vessels, and other such processes. His small solar alembics he can use for distilling essences, for heating the sand-bath, and similar objects. The rays are brought to a focus upon the alembic by the concave mirror. The great mirror of Mouchot has a diameter of 3.80 metres. The form of concentrating mirror used at first did not utilize more than 50 per cent of the solar heat. The new form, devised by Abel Pifre, gives back 80 per cent of the total possible heating effect. The older one was conical, while the new form approaches the parabola, the generatrix being a broken line forming three truncated cones, the middle one having its sides inclined to the axis 45° , the same angle as in the simple truncated cone used in the older form. This reflector presents to the sun an effective area of nine square metres. The boiler, holding 50 litres, is brought to a boil in 50 minutes, and the pressure then rises at the rate of one atmosphere every seven or eight minutes. With this apparatus Mouchot has obtained six times the useful effect given by the other. With a steam-engine of special construction, made movable in its bed to correspond to the direction of the reflector, 100 litres of water per minute are raised three metres. A motor of one horse-power has been constructed, the reflector of which has at its opening a diameter of $5\frac{1}{2}$ metres, or an area of incidence of 20 square metres.

EVANGELICAL ASSOCIATION. The following is a summary of the statistics of this Church, as they were published in August, 1881:

CONFERENCES.	Itinerant preachers.	Churches.	Members.
East Pennsylvania.....	83	194	14,895
Central Pennsylvania.....	75	186	11,895
Atlantic.....	20	22	2,195

* The report of this conference is included in that of the Des Moines Conference, from which it has been taken and organized.

Number of local preachers, 611; Sunday-schools, 2,016, with 21,773 officers and teachers and 127,557 scholars; number of baptisms during the year, 1,328 of adults and 7,828 of children; probable value of the 1,534 churches, \$3,350,485; number of parsonages, 456, of a probable value of \$431,810; amount of "conference contributions," \$5,313; of contributions for missions, \$92,740; of contributions for the Sunday-school and Tract Union, \$2,773. The increase in the number of members during the year was 1,674.

EXHIBITION OF ELECTRICITY AT PARIS. Among the notable events of the year was the International Exhibition of Electricity opened in Paris, August 11th, in the Palace of Industry, in which the World's Fair of 1855 was held. So rapid has been the development of electrical appliances in recent years, that this great building, with its forty-five thousand square metres of space, barely sufficed for the present display. Indeed, a number of pavilions were erected without its boundaries by numerous exhibitors. The different countries were very fully represented, the largest and most varied exhibit being made by France, which occupied as much space as all the rest of the exhibitors; England, Germany, and America being next in order. While the exhibition was devoted to electrical appliances of all kinds, the chief feature was undoubtedly the large and varied display of electric lighting—the lamps of both the arc and incandescent type, the machines for generating the current, and the many details of a complete system of this mode of illumination. In the main hall, a large rectangle, two hundred and fifty metres long by one hundred broad, all the various forms of lamps were commingled, producing a dazzling glare of light, that rendered comparison impossible. But in the smaller saloons reserved for the different exhibitors, only the special lamp of each exhibitor was shown, allowing of a correct estimate of each form of light. The display of lamps of the arc type was very full, all of the now well-known, as well as a number of more recent, lamps being shown. The interest, however, centered upon the systems of incandescent lighting, examples of which were exhibited by Messrs. Edison, Maxim, Swan, and Lane-Fox. The arc had already made for itself a permanent place, but about the incandescent lamp there was much doubt. This has been very largely removed by the excellent showing made by these lamps at the exhibition, and several prominent electricians, who have looked with great disfavor upon this method of illumination, have in consequence announced their belief that the problem of household illumination by electricity, if not solved, is at least very near a solution. The most complete of the exhibitions of incandescent lighting was that of Mr. Edison, whose system, from the lamp to the conductors, was shown in detail. A thousand lamps, three hundred in the two saloons

devoted to his exhibits, and the remainder lighting the grand stairway, were operated by his enormous steam dynamo of one hundred and twenty-five horse-power. The Maxim incandescent light was also very fully shown, about two hundred lamps being in operation. The Swan and the Lane-Fox lamp, and the two English incandescent lamps, made good displays, but neither are as complete as the systems of Edison and Maxim.

Outside of electric lighting the exhibition was full and varied, but space can only be given here to a few of the more notable devices, including one or two others which were not illustrated at the exhibition.

Sir William Thomson has made a careful mathematical calculation of the conditions of transmitting water-power from Niagara to Philadelphia, Boston, New York, Montreal, and all places within a radius of three hundred miles. The dynamo-machines of Gramme or Siemens, supplemented by the Faure storage battery, make it demonstrably practicable to transmit the power of water-falls for long distances and use it for mechanical work with less dissipation of energy than in ordinary hydraulic and mechanical contrivances for transmitting power a few hundred yards. He proposes to convey the current by a solid copper wire carried over-head like ordinary telegraph wires. A current of 240 webers can be transmitted 300 miles by a wire $\frac{1}{4}$ inch in diameter, receiving energy at the rate of 26,250 horse-power from dynamos driven by the Niagara water-fall, and discharging it at the farther end at the rate of 21,000 horse-power. The loss of 20 per cent by conversion into heat in the conductor would not raise the temperature of the wire above that of the surrounding atmosphere more than 20° centigrade. The potential of 80,000 volts on the conductor would not render the isolation of the wire difficult, nor would it be dangerous to manage in the central station; but when applied to miscellaneous practical uses it must be reduced to 200 or 100 volts. This can be done by the medium of the Faure battery. A battery of 40,000 cells can be connected directly with the electric main; and at short and regular intervals a small number of the charged cells can be removed and replaced by new ones. Sets of fifty could thus be constantly replaced, and the charged cells placed in connection with the supply circuit. In electric transmission of power high potential is a condition of economy. The idea of the application of water-power at a distance by electric transmission was first suggested by C. W. Siemens in 1877, and has been made the subject of thorough theoretical study by Sir William Thomson, who stated the results of his calculation in an examination before a parliamentary committee on electric lighting in May, 1879, and called the attention of the British Associa-

tion to the subject in an address at the meeting of 1881.

The Gramme machine was the first electro-motive device which proved practically valuable. It consisted of a ring of iron, with a coil of insulated wire wound around its rim, rotated between the poles of an electro-magnet. The leading feature was the commutator, which kept the current always running in the same direction and perfectly continuous, and allowed of the current being used to increase the power of the electro-magnet, besides doing the mechanical work required of the machine. The

GRAMME'S DYNAMO-ELECTRIC MACHINE.

same method of economizing the electricity was worked out by Siemens and Wheatstone; but its development by Gramme first led to the practical use of electricity for the generation of light. Various new modifications of the dynamo-electric machine were shown at the Paris International Electric Exposition of 1881. Surprise was caused among the electricians by the exhibition of electrical machines invented in 1860, and described in 1864 by Professor Pacinotti, of Cagliari, which contain all the essential features of Gramme's later invention and some of the improvements which have been added.

A newly invented machine by Dr. Hopkinson consists of twenty-four fixed magnets arranged in two opposite circles with unlike poles facing each other, between which revolves an iron ring in which channels are cut out alternately on the opposite sides. It thus presents square projections, around which as cores are wound bobbins of wire, whose ends are attached to the arms of the commutator. This device allows the current to be taken from any opposite pairs of arms in the commutator by a number of brushes.

The Bürgin machine has field-magnets like a Siemens machine, and an inside ring, which

differs from that of the Gramme machine in being divided into eight parts. Each of the eight narrow rings, which are hexagonal, is wound with wire, each side of the hexagon serving as a bobbin. This allows the corners of the hexagon to approach more nearly to the field-magnets, increasing the induction. The corners are not placed opposite each other, but each ring is carried a little farther around the axle than the next, so that the current is derived from the forty-eight bobbins in succession. A new form of Gramme machine, devised for the Jablochkoff and similar lamps, which require alternating currents in opposite directions, acts as its own exciter, instead of requiring a separate machine as formerly. The Weston machine resembles a Siemens machine, with field-magnets of the Gramme type. The metal strips of the commutator are twisted spirally.

The improvement of Planté's secondary battery by Faure has occupied the attention of electricians more than any other recent invention, on account of the important useful applications which may be found for a device which stores up electric energy and gives it out again whenever needed in a moderate quantitative current. The condensing battery of Faure has already been applied to useful purposes, such as electric lighting, but its economy and utility are thus far the subjects of theoretical conclusions principally. A Faure apparatus weighing one hundred and forty pounds can store up energy which can be converted into one horse-power of mechanical work continuing for one hour.

Secondary batteries of this type have been made before by Planté and by Ritter, a German electrician. Planté improved upon Ritter's plan by employing lead for the plates. The earliest form of a secondary battery was proposed by Grove in 1841. The principle of a secondary battery is to accomplish a chemical separation by the electrolytic action of the voltaic current of the constituents of a substance, which in reuniting convert into electricity again the energy which had been stored up by the chemical work in a static form. Grove made such a battery by electrically decomposing water. A continuous current was evolved by the spontaneous recombination of the hydrogen and oxygen, but it was exceedingly feeble on account of the limited surface of triple contact between the platinum, the acidulated water, and the gas. Dr. Siemens contrived a gas-battery in 1852, in which greater surfaces of contact were obtained, and a current of considerable power was produced. He used carbon tubes coated with platinum powder. With peroxide of lead instead of platinum better results were obtained and the cost of the apparatus reduced. Planté obtained greater surface and a larger current by rolling two lead plates into a spiral form and separating them by an insulating material. By a peculiar process of preparing the plates he increased the duration of the current. Faure has done

away with this long and elaborate process of formation, and has greatly increased the capacity of the secondary battery. In all secondary batteries the voltaic current produces a chemical change in the plates, which in returning to their original condition generate a current. The material agents by which the storing of

THE FAURE BATTERY.

electric force takes place in Faure's cell are lead, and red-lead or minium. Red-lead is a mixture of equal parts of the protoxide and the sesquioxide of lead. It is formed by passing a current of air over metallic lead at a temperature of 700° Fahr. The sesquioxide in its composition is prone under proper conditions to part with its excess of oxygen, and will be largely converted into the protoxide at a red heat; while the lower oxide has a tendency to take up more oxygen. Faure's battery consists of two plates of lead coated with red oxide, covered with porous felt, and rolled up into a spiral scroll. Two scrolls are placed side by side in a vessel of acidulated water, with a strip of lead projecting from each by which a circuit connection with a battery can be established. When the circuit connection is made with the poles of a galvanic battery or a dynamo-machine, the voltaic current causes a chemical action to take place. The red-lead on the spiral plate which is joined to the positive electrode becomes gradually more highly charged with oxygen and is converted into the peroxide of the metal, while the oxides on the plate connected with the negative pole gradually part with their oxygen and are reduced to the state of spongy, metallic lead. When the battery is charged—that is, when the red-lead is deoxidized on one plate and converted into the highest oxide on the other—the plates can be disconnected from the charging battery, and the chemical work which has been accomplished

by the current preserves in the condition of unstable equilibrium the energy which has been expended in effecting it. The molecular tension is loosed, and the whole store of energy is given back again in the form of an electric current, when the two plates of the cell are brought into metallic connection. The chemical work is then reconverted into electric energy, the peroxidized plate and the deoxidized plate both returning into their former condition, and a voltaic current being evolved while the active exercise of their chemical affinities continues.

Sir William Thomson has designed an automatic device by which, when a Faure battery is connected with a dynamo which supplies the current for a circuit of electric lights, the surplus electricity generated by the machine can be taken up by the accumulator, the circuit between them being made and broken automatically. With this appliance the lamps can be supplied from the battery with sufficient light-giving power for some hours after the machine has stopped. This would not only be an economy, but would avert the extinction of the lights which occurs when any accident befalls the machinery. The high-pressure gas-motors of Otto have been of great service in furnishing power economically for Gramme's electro machines. By mingling illuminating gas and air in proper proportions and under pressure, a quiet combustion and regular expansion are obtained, free from explosive shocks.

The Siemens electrical railway, which has been in use for some time in Berlin, was the first practical application of electricity to locomotion. As in the similar device of Edison, the electric current can be conveyed by the iron rails; but usually it is carried on a wire which is tapped by carriers on the car, setting in motion a dynamo-machine, which actuates the wheels on one side of the car by a chain-connection geared to their axles. The attempt has been made in Paris with the Faure battery to obviate the use of conducting wires, and enable a car to be propelled over any railway by a dynamo fed with the electricity in the accumulator until the stored-up energy is exhausted. The electrical railway-car is a large tram-car. The only feature observable in which it differs from other cars is presented by the couple of wires which travel with it and connect it by running contact with two conductors suspended on posts like ordinary telegraph-wires. The current generated by a stationary dynamo-electric machine is thus introduced into the locomotive and actuates an electro-magnetic machine under the floor, which drives the wheels of the car. In the beginning the rails were used as the conductors of electricity, instead of suspended wires. That plan was practiced on the elevated railway which was built for the Siemens electric cars in Berlin.

Tresca, a well-known electrician of Paris, has experimented on the application of electricity to plowing. With a Gramme machine

making 1,200 revolutions a minute, he plowed a furrow 222 metres long with a double Brabant plow at a velocity of 88 centimetres a second. The effective work was about 3 horse-power. The current was transmitted on copper wires from the generator to two Gramme machines which actuated windlasses. The plowing-machine invented by Menier is propelled by the large form of Gramme dynamo-machine, and is capable of doing the work of eighteen horses. It consists of two electrical locomotives containing large coils of wire rope by which a triple-shared reversible plow is drawn backward and forward across a field. When a furrow has been plowed, the electric machine is geared to the heavy wheels of the locomotive, propelling it forward to the next position; and then the plow is tilted over, bringing the three opposite shares into action, and drawn across the field in the reverse direction.

An electric brake has been invented by a French electrician, Achard. There are two rings of iron on the axle of each pair of wheels, and facing these two larger rings on an independent axle, which are connected with a powerful electro-magnet. The current is generated by an electric machine in the locomotive. The brake is kept from the wheels by strong spiral springs, and the independent axle remains stationary until a current is generated. Then the larger rings are converted into magnetic poles; the attraction of the rings on the wheel-axle causes the magnetic rings to revolve and wind up a chain connected by levers with the brake. The pressure of the brake can be increased or diminished by the engineer through an appliance depending on the principle of variable resistances. Many forms of small motors driven by element batteries have been devised, and the applications of these for sewing, embroidering, and other light work, are often as practical as they are elegant. The most notable of these contrivances are by French inventors. They are of slight account, however, in comparison with the mechanical generation of electricity and its applications. An interesting use of the Gramme machine was shown at Paris in the rock-drill, which rotates under the influence of the dynamo while it is held to its work by a head of water, which, in the Paris water-works, affords a pressure of three atmospheres.

One of the most important improvements in telegraphy is the harmonic telegraph of Elisha Gray, which has been for some time in operation between Boston and New York. A tuning-fork of a certain pitch is kept vibrating at the sending-station by an electric current, which can be intermitted by the key of a Morse instrument. Through the medium of the tuning-fork the circuit of the telegraph-wire is joined and broken at each vibration, and at the receiving-station another tuning-fork is acted upon by the intermittent current, and vibrates at the same rate. When the operator at the dispatching-station touches the

key of his instrument, he stops the current, and the tuning-fork at the receiving-station ceases to vibrate. A spring then draws against the tuning-fork a contact-piece, which is usually kept away by the vibrations. Through this contact a local current passes which causes an ordinary telegraphic sounder to respond to the intervals in the vibration of the tuning-fork by the long and short signals of the Morse alphabet. If another tuning-fork at the sending-station, vibrating at a different rate, is connected with the wire, it will send currents at each of its vibrations, which will act upon another fork at the receiving-station, and cause it to vibrate at the same pitch. This can be connected with an independent battery and sounder. On this ingenious plan as many as five instruments can send messages over the same wire in one direction, and five more in the opposite, as fast as the ten operators can work their instruments, without any interference or confusion.

The multiple type-printing telegraph of Baudot is an ingenious improvement on the printing-telegraphs of Edison and Hughes. In the Hughes instrument there are twenty-eight radial arms connected with a key-board, before which a metal contact-piece rotates rapidly. At the receiving end the inked type-wheel is moving in perfect synchronism, by means of ingenious adjustments, with the clock-work machinery at the other end. When a key is struck, contact is made with the corresponding radial arm, and a momentary current passes, which brings in play the electro-mechanical apparatus at the receiving end, and causes the paper to be lifted instantaneously against the type on the wheel corresponding to the note struck on the key-board. The rapid response of the armature to the current is secured by a new relay arrangement, called the Hughes magnet, in which the armature is kept in contact with the poles, but is suddenly drawn away by a spring when the current passes, and weakens the magnet. In Baudot's system five signals are variously combined to give the twenty-six letters of the alphabet, and five other signs. An arm bearing thirty contact-springs revolves in front of thirty contact-pieces, so that thirty signals can be transmitted at each revolution. Six operators have control of five contact-pieces each. At the receiving end there are six machines, with five electro-magnets and armatures in each, which are set in action by the momentary signal-currents. By an admirable mechanical arrangement the signals are translated automatically, and the proper letters printed, evenly upon a strip of paper. A radial arm, rotated about its center, carries five points which press against a flat plate, which pressure prevents the arm from turning upon its axis under the influence of a spring. The points are moved a little to one side or the other by triangles, which are actuated by the armatures. In the plate are depressions, and when all the points strike a de-

pression at the same time, a partial revolution of the arm about its axis takes place. This causes the revolving type-wheel to impress the letter indicated by the combination upon the paper. It is found easier by the operators to make the combinations themselves on a key-board with five keys, than to use one with a note for each letter and sign. With Baudot's apparatus six messages can be sent on one wire at the same time, at the rate of twenty-three words a minute each.

Autographic telegraph instruments have not yet been found practically useful. They would be a valuable aid in strategic operations, as maps and plans could thus be sent in facsimile by telegraph. The message is written on a surface of tin-foil or other metal, which is connected with the earth. The ink is some substance which acts as an insulator. The tin-foil on which the message is written is given a uniform motion, under a style which has a transverse motion. The marker and the paper on which the message is reproduced have a corresponding and exactly synchronous movement at the other end of the wire. When the style touches the ink on the tin-foil, a current passes. In the instruments of Caselli and D'Arlingcourt the marker is an iron point, and rests upon paper impregnated with ferrocyanide of potassium. This is decomposed by the electric current, leaving a blue mark. Meyer uses ordinary paper and an inked marker, which is brought in contact with the paper by the action of the current. A message of 145 words is reproduced by D'Arlingcourt's instrument in five and a quarter minutes.

Edison's autographic telegraph has several advantages over the other devices of the class, the chief of which is that the sender of a dispatch has no difficulty in preparing his message, as he does when he must write it with a thick, fatty ink, or other unusual materials. Edison's apparatus consists of two instruments exactly alike, in which are two cylinders that revolve synchronously, being actuated by electric motors and regulated by conical pendulums so disposed as to keep perfect time with each other. On the cylinder of the receiver is wound a sheet of chemically prepared paper. The dispatch is written on soft paper with a rather hard lead-pencil. A narrow plate moving slowly along the cylinder is pierced by a hole into which fits a steel point. This point traverses the entire sheet of paper in a spiral line. On the smooth paper it is on a level with the lower surface of the plate; but when it crosses the mark of the pencil it falls into the groove made in the paper. This displacement of the point is made to produce an electric contact and to send a current to the other end, where a blue mark is made on the paper of the receiver every time, and as long as the metallic point is in the depressed track of the pencil.

Of the brilliant series of electric inventions

given to the world within the last few years, none seem more marvelous than the photophone of Professor Graham Bell. This is a telephone in which a beam of light is made to take the place of the metallic conductor. Variations in the intensity of a ray of light, produced by the vibrations of a flexible mirror, or of an elastic membrane with an aperture for the passage of the light, under the influence of sound-vibrations, are made to set up in a telephone wire the same electric vibrations as are conveyed over an ordinary continuous telephonic conductor, and cause the resonant receiver to reproduce the sound-waves. This takes place through the medium of a substance possessing the curious property of conducting electricity under the influence of light, but resisting the passage of the current in the dark. This mysterious phenomenon was observed in the rare element selenium, belonging to the sulphur group, by Willoughby Smith, in 1873. The conductivity of selenium varies exactly in proportion to the intensity of the light to which it is exposed. Bell found that a piece of selenium, acted upon by a continuous galvanic current, and placed in a telephonic circuit, when subjected to rapid alternations of light and shade, produced by a revolving mirror, would cause the telephone receiver to give forth musical tones. Thus, the action of variable light, through the peculiar sensitiveness of selenium, produced the molecular vibrations in the electric conductor which generate sound in the receiver. The note sounded was the

one whose vibrations, per second, is equal to the number of revolutions made by the mirror. This means, by which light, through its variations in intensity, gives rise to sonorous vibrations, was utilized to transmit the effects of sounds, as human speech, and to reproduce the sounds at a distance in the following manner:

An aperture in a flexible membrane was placed opposite an aperture in a parallel fixed plate. Through these two holes a ray of strong light was passed, which was concentrated at the farther end by a concave mirror upon a pencil of selenium, connected with the receiver of a speaking-telephone, and subjected to a continuous current from a galvanic battery. The sound of the voice would produce vibrations in the membrane, whose amplitude and rapidity would cause corresponding variations in the intensity of the ray passing through the two apertures. The effects of these variations on the selenium gave rise to corresponding undulations in the electric current, which were reconverted into sound-vibrations by the receiver. A better mode of affecting the luminous ray by the sound-waves was found to be to reflect the ray to the receiving apparatus with a plane flexible mirror of silvered mica, or exceedingly thin glass, which, responding to the sound-vibrations of the voice, modified by its movements the intensity of the reflected ray. Electric light, as well as sunlight, and even gas- and lamp-light, have been found capable of conducting the sound-generating undulations.

Bell's and Tainter's experiences of the resonance of various substances under the action of intermittent light (see *RADIOPHONY*) suggested the trial of the most sensitive of these substances in a photophonic receiver. Lamp-black, by far the most powerful generator of sound under the influence of the intermittent beam, was accordingly tried, and gave decided results, without the intermediation of the electric current. A photophonic transmitter, with a diaphragm only five centimetres in diameter, reflected a beam received directly from the sun to a smoked receiver, which, at a distance of forty metres, reproduced distinctly words spoken into the transmitter in a low voice.

Dr. James Moser has shown that the action of a selenium photophone is that of a microphone, and is due to the slight and imperfect contact in the selenium-cell, and the changes in resistance are caused by alterations in the degree of contact effected by the absorbed rays of the intermittent beam. These changes, he maintains, are due to the heating and chemical effects of the illuminating rays absorbed.

In telephones proper few changes have been made in the instruments as originally patented by Bell, Gray, and Edison. Bell's telephone consists of a straight magnet, with one pole wrapped with a coil of insulated wire, and an iron diaphragm in front of it for receiving or transmitting the sounds. In later forms, both poles of the magnet are made to act upon the diaphragm. The remarkable invention of the microphone, by Hughes, has greatly increased the utility of the telephone. Hughes discovered that, when pieces of carbon in loose contact, resting upon a piece of wood, are placed in the circuit of a telephone, the very slightest vibrations communicated to the wood are heard dis-

tinety in the telephone. It was by placing microphones on the stages of Paris theatres, connected with telephonic receivers in the Exposition building, that every sound of an opera could be heard by visitors at the International Exhibition of Electricity, as distinctly as in any part of the Opera-House.

The "pantéléphone" of Loehet Labye, a Belgian inventor, is not only one of the simplest microphones yet made, but is one of the most sensitive—transmitting ordinary speech, uttered at distances of thirty or forty yards, and the lowest whispers spoken several feet away. It consists of a plate of cork, six inches by four, hung at one side on two pieces of thin watch-spring, one of which is connected by a wire with a button of hard carbon imbedded in the cork, which is pressed upon by a brass hook working on a hinge. The transmitter is connected in the usual way with a battery and induction-coil.

Professor Dolbear has invented a speaking-telephone in which no magnet is used in the receiver. The transmitter is a form of the microphone. The receiver is formed by two metal plates or diaphragms, electrically insulated from each other, and held parallel in a wooden frame. One of the plates is connected to the telephone-current, and the other to the earth. Being oppositely charged, the vibration produced in one of them by the current sets up audible vibrations in the other.

Dr. Cornelius Herz has advanced a step in the construction of telephones by disarding the magnetic receiver, and disregarding the principle of magnetism. With his instrument he succeeded in conveying audible speech along a wire 800 miles in length. The only battery used was a single Leclanché element.

The electric arc, placed in a vacuum, as was observed by Davy, the discoverer of the arc, becomes elongated, and the carbons are no longer consumed. The experiment has been repeated by Jamin, with results which promise to give a new form to arc-lamps in the future. Gases which have no action upon the carbons—as nitrogen, acetylene, carbonic oxide, and marsh-gas—answer the purpose as well as a vacuum. If the carbons are inclosed in a sealed vessel containing ordinary air, the oxygen is taken up by the carbon, leaving only nitrogen and carbonic oxide in the vessel. The light in the closed vessel is absolutely even and steady. Its spectrum is like that of carburetted gas traversed by the spark of a Ruhmkorff coil, or like that of the comet of 1881, as observed by Thollon and others, being the electric spectrum of incandescent carbon-vapor. Whether the carbon is of good or of very poor quality, the flickering, which is never entirely absent in open-air lamps, is avoided altogether. The arc gives a full, distinct, and perfectly changeless light, of a greenish-blue tinge. The red and wavering light of open-air arc-lamps is due to the combustion of the carbons and their inequalities. A single Jamin candle in

the ordinary apparatus lasts two hours, but in the atmosphere of inactive gases, in a hermetically sealed globe, each candle burns 160 hours, and the lamp with five candles burns 800 hours without change or attention.

The mechanical arrangements for feeding the carbons in the arc-lamps are exceedingly various, and are being constantly improved upon. Siemens and Brush have an arrangement by which a pair of carbons that are burned out are automatically replaced by a fresh pair. The Belgian lamp invented by Jaspar is regulated by a magnet within a solenoid which supports the upper carbon, and is raised and lowered by the varying power of the current. The English light of Andrews contains electromagnets which act upon a clutch holding the carbon. In the latest form of the Gramme lamp there is an arrangement of electromagnets and clock-work machinery which allows the upper carbon to fall at the rate of only a tenth of a millimetre at each step: one magnet adjusts the carbons at a proper distance apart, as soon as the current begins to pass; and when the main current becomes weaker, that in the second magnet is strengthened and causes the clock-work to move.

Recent improvements in lamps of the semi-incandescent type, exemplified by the candle of Jablochkoff, have been made by Jamin, Debrun, and others. Rods of plain carbon are used instead of kaolin or other substance whose incandescence gave a colored light. Jamin surrounds the rods with coils of wire, with a space between the coil and the candle. The inductive action of the current in the coils drives the light a distance beyond the ends of the candles. Debrun's similar light has an arrangement for instantaneously relighting a lamp which has gone out, by means of a commutator, which causes a piece of carbon to join the two candles establishing the current, which then repels the cross-piece and re-illumes the arc. The *lampe-soleil* is a steady light in which a block of marble is rendered incandescent by the current between the carbons.

The Brussels meteorograph is an instrument which records and automatically telegraphs to a distance, where they are reproduced on a revolving drum, the readings of the wet and dry bulb thermometer, the barometer, the anemometer, and the rain-fall. The drum contains the curves giving the readings of the various instruments every ten minutes, for a period of five days. A Swedish form of the meteorograph records observations at intervals of fifteen minutes, and requires no attention for months at a time.

Four forms of incandescent filament-lamps were exhibited at the Paris Electrical Exposition. The Swan lamp is little more than a repetition of Edison's. The carbon filament is a piece of cotton thread, treated with acid and carbonized by baking in an intensely high temperature. It is burned in a vacuum globe, being attached at its two ends to platinum con-

ductors at the base of the globe, at which point it is considerably thickened. The filament rises above the middle of the globe and is looped at the top. Edison prepares his carbon filament from bamboo-fibers. It is held at its extremities by small copper clips. The British Electric Light Company exhibited a modification of the Lane-Fox lamp. The Maxim and the Edison lights have been described in previous volumes. The material of Maxim's filament is cartridge-paper. Instead of producing a vacuum in the globe at once, he fills it with a hydrocarbon gas, which deposits carbon on the hottest and therefore thinnest portions of the thread, thus making it uniform in strength and thickness. The Maxim lamps have the advantage over the others that they can be used with a powerful or a weak current to produce either a bright or more moderate light. By his ingenious generating apparatus the strength of the current with which the lamps are fed depends upon the number of lamps, so that, if some of the lights in a circuit are put out, the intensity of the remaining ones is not increased.

The International Congress of Electricians settled upon a uniform international standard of electrical measurement. The *volt* remains the unit of electro-motive force, and retains its old value. The *ohm* is also preserved as the unit of resistance, and represents the same quantity as before. The unit of current is the same in value as before, being the current given by one volt acting through one ohm's resistance, although it is no longer called a weber, but an *ampère*. The quantity of electricity transmitted per second by one ampère of current is called a *coulomb*. The unit of electrostatic capacity is the *farad*, which is so related to the other measures that one coulomb in a farad gives one volt; in other words, if a condenser be charged by an electro-motive force of one volt, it has as many farads' capacity as it contains coulombs.

EXPLOSIONS, BOILER, CAUSES AND PREVENTION OF. The mystery that surrounds so many boiler-explosions seems in a fair way of being cleared up by the experiments of Mr. D. T. Lawson, of Wellesville, Ohio, who in June, 1881, succeeded in exploding a boiler of the best construction and well filled with water, conditions which are generally held to secure perfect safety. A number of explanations of boiler-explosions have from time to time been advanced by practical steam-users as well as theorizers, but the commonly accepted explanation—the one held alike by steam-engineers and the general public—is the low-water theory. According to this, an explosion is due to the rapid conversion of the cool feed-water into steam when it comes in contact with the highly heated flues and other metal surfaces of the boiler left exposed to the fire. When in contact with water these parts can not become more highly heated than the water and the steam above it, which is usually not much

above 300° Fahr.; but, if the water be allowed to get low enough to uncover them, they may readily be raised to a red heat (900° Fahr.). If a fresh supply of water be then pumped into the boiler, this, striking the hot iron, will be quickly converted into steam, and it is held that a sufficient pressure may be thus produced to cause an explosion. This theory was pretty thoroughly tested some years ago by a commission appointed by the United States Government, and provided with a liberal appropriation. The experiments, which were begun at Sandy Hook and continued near Pittsburgh, resulted in failure, as the commission was unable to produce an explosion, though a great number of trials were made. No report of the commission has been issued, the only information accessible being the accounts in the daily papers at the time. Mr. Lawson takes issue with the low-water theory, on the ground that but a small quantity of water could be instantly converted into steam by striking the hot iron of the boiler, and this much too small a quantity to produce an explosion. With a larger amount of water the formation of steam would be too gradual to produce the enormous and sudden pressure necessary. In opposition to this theory he advances the one that explosions are due to highly heated water bursting into steam upon the sudden removal of pressure from its surface, and the then as sudden checking of the escape of the steam so formed. This lessening of pressure may be caused either by the sudden withdrawal of steam to supply a cylinder, as when an engine is started; or by suddenly condensing the steam by allowing the entering, comparatively cool, feed-water to strike it. When either of these things happens, the highly heated water bursts into steam, which, having no vent, subjects the boiler to a powerful concussive shock, quite sufficient, Mr. Lawson thinks, to rend it. According to this theory, the force of the explosion not only increases with the amount of water in the boiler, but a considerable quantity is necessary to produce an explosion at all. The results of the experiment undertaken by Mr. Lawson to test this theory seem to very fully confirm it, and it appears to be in entire harmony with what is known on the subject.

As is well understood, the power exerted by an explosive agent is due simply to its rapid conversion by combustion into gases occupying many times the volume of the substance. Now, gunpowder when exploded occupies a volume in the gaseous form but 300 times that of the solid one, and nitro-glycerine but 900 times, while steam occupies at atmospheric pressure nearly 1,700 times the volume of the water from which it was generated. It is evident, then, that if water could be converted into steam instantaneously, it would form a very powerful explosive. Instantaneous action probably never occurs, but it is quite possible that the conversion can take place with suf-

ficient rapidity to produce a concussive effect at least equal to gunpowder, and this is much in excess of what would be required to rend the strongest boiler ever constructed.

The experiment was conducted at Munhall Farm, near Pittsburg, where the later experiments of the Government commission were carried out. The boiler was a plain cylindrical one, six feet long and thirty inches in diameter, constructed of a quality of iron having a tensile strength estimated at 700 pounds to the square inch. The shell was three sixteenths of an inch and the flanged heads three eighths of an inch thick. It was at first intended to make the test by condensing the steam above the water, but, fearing that this could not be done quickly enough, it was decided to use a cylinder. This was connected with the boiler by a two-inch pipe, in which was placed a quick-lifting valve, operated by a cord from the bomb-proof in which the experimenter conducted the test. A steam-gauge, connected with the boiler by forty feet of one-fourth-inch pipe, was also placed in the bomb-proof. The boiler was set up horizontally, and filled with water to within six inches of the top. The fire was fed with petroleum, the supply of which could be controlled from the bomb-proof. A preliminary experiment on June 7th, when the thread was stripped off the bolts of the cylinder-head and the gasket blown out, showed that the steam-pipe to the cylinder was much too small, and a considerably higher pressure than anticipated would be required to secure an explosion. It was decided, however, not to make any alterations, and the repairs being effected, the final and successful experiment was made on the 16th. At 260 pounds' pressure the steam-valve was lifted, with no other result than to cause a violent oscillation of the gauge. This was repeated at 300, 335, and 365 pounds' pressure, with similar results. At 380 pounds, however, there was a loud report, and the boiler was found to be blown to fragments, the air in its vicinity being filled with condensing steam and falling *débris*. There appeared to be no initial point, the boiler going to pieces all at once, as would be the case if subjected to a powerful concussion. The pieces of the boiler found showed that the plates were rent transversely at least four times and torn open their entire length. One of the heads, which were thought to be the weakest parts, was found intact, with a portion of the shell adhering. At the point where the boiler stood, nothing was found except a few broken grate-bars, and the sunken stone foundations. With the experience gained by this trial, Mr. Lawson hopes to be able to explode a boiler of the same strength at a pressure not greater than what would be considered a safe working one, and thus show that the conditions necessary to an explosion by his theory are all present in actual practice. Mr. Lawson has devised a boiler in which the steam compartment is separated from the wa-

ter by a perforated partition, which he claims can not be exploded. This claim he proposes to subject to the test of experiment after concluding his experiments with ordinary boilers. Whether this test proves successful or not, the experiments so far have been of very great value in showing that the conditions commonly assumed to secure complete safety are fraught with danger, and the need of a reconsideration of the current theories on the subject.

EXPOSITION, INTERNATIONAL COTTON, AT ATLANTA, GEORGIA. In an article written by Mr. Edward Atkinson, of Boston, and published in the "New York Herald," in the autumn of 1880, attention was directed to the serious defects in the existing mode of picking, ginning, cleaning, and general preparation of raw cotton for market; and the suggestion was made that an exhibition of cotton and cotton machinery be held during the ensuing year, at some convenient place, for the purpose of bringing together those interested in the production of cotton and in the manufacture of cotton goods, that they might consult together and devise practical remedies for the defects indicated. Appreciating the importance of Mr. Atkinson's statements and suggestion, a number of citizens of Georgia invited him to visit Atlanta, and make a public address on the matters referred to in his communication to the "New York Herald." Mr. Atkinson accepted the invitation, and, on October 19, 1880, addressed a large meeting in the Senate-chamber, in which he set forth, at considerable length and with minuteness of detail, the present defective manipulation of raw cotton by the producers, how it might be profitably improved, and the great advantages to both producer and manufacturer which would result from the proposed improvements. He recommended that the suggested exhibition should represent everything relating—1. To the growth, fertilization, and cultivation of the cotton-crop; 2. To the manipulation of the staple in every stage of its preparation for market; and, 3. To its manufacture, including all the implements, machinery, mills, fertilizers, etc., requisite for the cultivation, preparation, and manufacture of cotton, and the best and most economical use of power. He further recommended that the exhibition should show the cotton plants and fibers of all countries, and all the varied cotton fabrics, presenting comparisons of the primitive and improved processes employed in cotton manufacture.

On December 2, 1880, preliminary steps were taken by some of the business-men of Atlanta, and other places, to give practical effect to Mr. Atkinson's suggestions; a temporary association was formed, and, in February, 1881, at the instance of a few of the members of that association, Mr. H. I. Kimball, of Atlanta, was requested to visit the principal commercial and manufacturing cities of the North and West, with a view to bring the matter to the attention of the business-men of those localities,

and ascertain their views as to its importance and as to the practicability of the contemplated exposition. The reception given to Mr. Kimball was so encouraging, he found so warm and earnest a response to his request for exhibits and subscriptions, that in April, 1881, the following gentlemen—Joseph E. Brown, Samuel M. Inman, H. I. Kimball, R. F. Maddox, B. E. Crane, E. P. Howell, M. C. Kiser, R. J. Lowry, Sidney Root, C. Wallace, J. F. Cummings, W. P. Inman, J. C. Peck, L. P. Grant, W. A. Moore, G. J. Foreacre, Richard Peters, E. P. Chamberlain, J. F. Wheaton, J. R. Brown, W. H. Young, Thomas Hardeman, C. H. Phinizy, Joseph Sibley, of Georgia; J. W. Ryckman, S. Bates, Richard Garsed, of Pennsylvania; H. Baldwin, of Maryland; James L. Harvey, of Virginia; R. Y. McAden, of North Carolina; William Trenholm, of South Carolina; J. Durr, of Alabama; S. Boyd, C. Bussey, L. Ranger, of Louisiana; Thomas Allen, William

L. Black, W. J. Paramore, of Missouri; Edward Atkinson, W. A. Burke, W. Gray, Jr., George Draper, of Massachusetts; J. H. Inman, Robert Tannehill, of New York; J. H. McMullen, of Maine; A. D. Lockwood, of Rhode Island, and David Chadwick, of London, England—obtained a charter of incorporation under the laws of Georgia, with the name of "The International Cotton Exposition," with a capital of \$200,000, in shares of \$100 each, the object of such corporation being "to hold one or more expositions of the appliances and machinery used in the cultivation, preparation, and manufacture of cotton and other fibers; together with exhibitions of cotton and other fibers and fabrics, and whatever else is directly or indirectly connected with or beneficial to the cotton and other textile interests of the United States and other countries." It was determined that the first of the contemplated expositions should be held at Atlanta,

INTERNATIONAL COTTON EXPOSITION AT ATLANTA, GEORGIA.

Georgia, opening October 5 and closing December 31, 1881. The officers of the organization were as follows:

President, Hon. Joseph E. Brown,* Georgia; first Vice-President, Robert Tannehill, New York; second Vice-President, Governor A. H. Colquitt, Georgia; third Vice-President, W. H. Gardner, Alabama; fourth Vice-President, William C. Sibley, Georgia; Treasurer, S. M. Inman, Georgia; Secretary J. W. Ryckman, Pennsylvania; Secretary *pro tem.*, J. R. Lewis, Georgia; Director-General, H. I. Kimball, Georgia.

Soon after the organization had been completed, books were opened for subscription to the capital stock in Atlanta and other cities, and the required amount was rapidly subscribed.

The chief control and supervision of all the operations and affairs of the exposition was wisely intrusted to Mr. H. I. Kimball, as Di-

rector-General, to whose administrative capacity, untiring energy, and zealous vigilance, the success of the enterprise is largely due. Committees of foreign representation, audit, installation of exhibits, construction, engineering and machinery, agriculture, minerals and wood, publication, transportation, awards, public comfort, admission and protection, were appointed, consisting severally of three competent members, in addition to the Executive Committee of twenty-nine, and the Finance Committee of five members. Hon. H. V. M. Miller, of Atlanta, Georgia, was appointed Foreign Commissioner, and Hon. Thomas Hardeman, of Macon, Georgia, was appointed American Commissioner.

Application was made to the General Assembly of the State of Georgia to make an appropriation in aid of the enterprise, which, though fully appreciating its value and importance, the Legislature was compelled to refuse, because the Constitution of the State does not warrant such a use of the public money.

* In September, Senator Brown having resigned, Governor A. H. Colquitt was elected president.

From the beginning, the newspaper press in almost every State in the Union gave its powerful aid in making known the purposes of the enterprise, and setting forth the vast benefits, social as well as industrial and commercial, which must necessarily result from an exhibition which would bring together the representative men of the great industries of the Union, which would display to the North the almost limitless resources of the Southern States; which would show the South the amazing inventive genius and mechanical skill of the Northern States; and which, manifesting the interdependence of North, South, East, and West, would tend to obliterate the recollections of civil strife and contention, and renew those ties of fraternity and good-fellowship which should unite Americans, to whatever geographical section they may belong. "The grand central idea of the exposition," said Mr. Kimball, "the main shaft to which has been belted every wheel that has worked for its success, is concentrated in the one word, 'improvement'—improvement of the knowledge of the people as to the great resources at their command, as to the best implements and machines which inventive genius has contrived for their development; as to the most approved methods of converting crude wealth into refined wealth; as to the avenues of labor through which they might march out of the bondage of poverty into the freedom of industrial, commercial, and financial prosperity; and, better than all else, improvement of the fraternal and patriotic spirit that is becoming to a people of a common heritage and a common destiny."

Preparations.—All the space had been applied for and allotted before the opening day; but, when that day arrived, there were piles of bales and boxes unopened and unarranged, owing somewhat to the dilatoriness of exhibitors, usual on such occasions, and somewhat to the inability of the railroads to forward them as rapidly as they were consigned. The unexpected number of applicants for space at the last moment made it necessary to provide increased accommodation. The managers generously preferred to inconvenience themselves rather than exclude any exhibitors. Thus, there was much work to be done for a month after the official opening, and during that time the buildings and the exhibition had an unfinished appearance; but the goods were put in position with wonderful rapidity, the work of the carpenters was pushed forward by day and night, so that even the early visitors were not disappointed, or the general effect of the show much impaired. Too much praise can not be given to the managers and their assistants, for the energy, zeal, and system which they manifested in the execution of the arduous and complex task which they had undertaken. Although none of them had any previous experience in the direction of such an enterprise, their good judgment, unwearying devotion, earnest desire to please, calmness and

good temper, in the countless details of their work, received the grateful applause of exhibitors and visitors.

The Opening.—The exposition was formally opened by Governor Alfred H. Colquitt, President, on the 5th of October, 1881, in presence of all the high officials of the State, a number of distinguished visitors, and a vast concourse of people, accompanied by some military pomp. After prayer by the Right Reverend Robert W. B. Elliot, Bishop of Texas, addresses were made by Governor Colquitt, Senators Z. B. Vance, of North Carolina, and D. W. Voorhees, of Indiana, and Mr. H. I. Kimball, of Georgia. Immediately after the conclusion of the addresses the engines were set in motion by Governor Colquitt, Senator Brown, and Senator Vance, the exposition was declared to be formally opened, and the fact announced to the public by the firing of a salute by a battery of artillery.

Buildings and Grounds.—The site selected for the buildings, etc., was Oglethorpe Park, the property of the city of Atlanta, covering an area of between forty and fifty acres, situated about two miles from the center of the city, on the line of the Western and Atlantic Railroad, well laid out and cultivated, and previously used for the fairs of the State Agricultural Society, and of local associations of a kindred character. The close vicinity of this park, its capacity, and its easy accessibility by train and a line of street-cars, gave it advantages possessed by no other site that could have been obtained. The main building, in the form of a cross, planned for a model cotton-mill, and constructed of very heavy timber, was 720 feet long by 400 feet wide, admirably lighted and ventilated, supplied with ample steam-power, consisting of three engines in the main building and one in the agricultural annex, and eight lines of shafting arranged for the operation of all sorts of machinery. It was traversed in its length and breadth by wide aisles, the total length of which was eleven miles, on either side of which, and in the center, the exhibits were displayed. Besides this main building, but connected with it, there were: 1. A hall, called the "Agricultural Annex," 275 feet by 100, in which the agricultural implements and machinery were exhibited; 2. A building known as the "Carriage Annex," 210 feet by 100, devoted to the display of carriages, etc.; 3. Two buildings, set apart for the exhibit of minerals and woods, the respective dimensions of which were 200 by 150 feet, and 100 by 50 feet. Overlooking the main building on the north side of the grounds was the Art and Industrial Hall, 310 by 55 feet, open to the roof 50 feet high, with wide galleries, reached by convenient staircases, devoted to the exhibit of works of art and all sorts of manufactured goods. Close to the Art Hall was a commodious room, 112 by 88 feet, called the "Judges' Hall," capable of seating 2,000, used for the meetings of the judges, and for the vari-

ous conventions and societies which met during the exposition. There were several other lesser and tastefully constructed buildings in different parts of the grounds, the principal of which were the "Florida Building," erected by the State of Florida for the display of the varied products of the "Land of Flowers"; the "Department of Public Comfort," containing offices for the telegraph, telephone, messengers, cigars, newspapers, etc.; and a restaurant, 100 by 53 feet (two stories), containing dining-saloons, parlors, etc. The buildings, covering twenty-one acres of floor-space, were all of wood, the main structure being of sufficiently heavy timber to fit it to be used for manufacturing purposes. The work of construction commenced on May 1st, and on September 1, 1881, the principal buildings were completed.

The cost of the buildings was \$140,000. The steam-pipes (six miles in length), water-supply, etc., cost \$20,000, making the total \$160,000.

The architects were Mr. W. H. H. Whiting, of Boston, Massachusetts, Messrs. Norman & Weed, and Messrs. Fay and Eichberg, of Atlanta. Mr. D. A. Lockwood, of Providence, Rhode Island, was the consulting engineer.

Immediately outside the inclosed grounds were a number of plots planted in cotton at different dates and with every variety of seed, wherein the public could see the cotton-plant in every stage of culture, and could judge of the relative value of the various modes and systems of tillage.

In order to insure the accommodation and comfort of visitors, and supplement the capacity of the city hotels and boarding-houses, the managers built an hotel 330 by 200 feet, close to the park, capable of entertaining comfortably one thousand guests. Besides this, the best citizens of Atlanta made arrangements in their private residences to entertain visitors. Thus, it was computed, ample accommodation was provided for thirty thousand daily visitors.

Classification of Exhibits.—The exhibits were divided into nine departments, which were subdivided into several groups, as follows:

I. Mineral and metallurgical products, divided into five groups: 1. General and State collections; 2. Ores, combustibles, building and refractory stones; 3. Mines, wells, and mining surveys; 4. Metallurgy; 5. Fertilizers. —II. Tools, implements, and machinery, divided into nine groups, viz.: 1. Preparing cotton and cotton-seeds; 2. Textile manufacturing; 3. Tilling, planting, and harvesting; 4. Motors and means of transmitting power; 5. Printing and telegraphy; 6. Breaking and dressing stone, working wood and metal; 7. Furnaces, blowers, and pumps; 8. Preparing agricultural products other than textile; 9. Transportation. —III. Manufactures, general, divided into seven groups, viz.: 1. Collective exhibits; 2. Chemical and pharmaceutical products, soaps, and perfumery; 3. Bricks, tiles, terra-cotta, chemical clay, and glass-ware; 4. Fire-arms, military

accoutrements, and saddlery; 5. Medicinal preparations and surgical instruments; 6. Railway supplies, builders' mill and metal work; 7. Safes, clocks, and ornamental metal-work. —IV. Manufactures, textile, divided into five groups, viz.: 1. Cotton yarn, cloth, and prints; other vegetable fabrics; 2. Woolen, mohair, and mixed goods, woven and felted; 3. Silk and silk-mixed goods; 4. Clothing and millinery; 5. Paper and blank-books. —V. Home and social improvement, divided into five groups, viz.: 1. Furniture and musical instruments; 2. Mirrors and table ware; 3. Heating, cooking, and lighting; water-supply; 4. Education and natural science; 5. Fine arts. —VI. Forest and agricultural products, divided into ten groups, viz.: 1. Forestry and general agriculture; 2. Cotton; 3. Fibers other than cotton; 4. Cereals, forage, and root-crops, sugar and tobacco; 5. Farinaceous and kindred foods, oils, and spices; 6. Animal products other than fiber; 7. Agricultural engineering; 8. Fruits, wines, flowers, and ornamental plants; 9. Cattle, mules, sheep, swine, dogs, and poultry; 10. Dairy products.

The system of awards adopted by the Centennial Exposition was followed substantially by the International Cotton Exposition. Competent and disinterested judges—112 in all—were appointed for the examination of the exhibits in the several departments which were entered for competition, who, after a careful and minute inspection of them, and with a specific statement of an expert before them as to the peculiar merits of each exhibit, awarded the prizes to the successful exhibitors. The "certificate of merit" was considered the highest testimonial of award; but with a view to encourage the collection of minerals, woods, agricultural products, and machinery for the preparation and manufacture of cotton, cash premiums, amounting in the aggregate to \$10,000, were offered to accompany the certificate of merit. In cases where a cash premium of \$100 or upward was awarded, the exhibitor was entitled to receive instead of the money a gold medal of equal value.

The exhibits made exceeded slightly eighteen hundred, embracing apparently every article in the range of American industry from a Corliss engine to a potato-peeler; and yet, though it surpassed in size and importance the most sanguine expectations of its promoters, the exposition did not fully justify its name. It was not "international" in the full meaning of the word. The goods, wares, and merchandise exhibited were exclusively American, with the exception of one roller-gin made in Oldham, England; of some combing machinery of foreign make, included in the large and attractive exhibit of the Willimantic Thread Company; of a valuable collection of foreign cotton fibers collected by Mr. S. M. Inman; and a highly interesting collection of hand-made native fabrics from China and Japan, contributed by Messrs. Russell, of Shanghai, and exhibited by

Mr. Edward Atkinson. This is not attributable to any failure on the part of the managers to invite the participation of foreigners. The character and purposes of the undertaking were made known to the leading representatives of the great industries in all the principal cities in Europe, South America, etc., and, from the cordial recognition of its importance in those countries, it was expected that they would have contributed to its exhibits in sufficient number to justify its being styled "international." The misnomer in this respect is due to the non-realization of reasonable expectations. It was not exclusively a "cotton" exposition, as its title would indicate. It was not intended to be so. It was the first exhibition of any magnitude that was ever held in the Southern States; and, while it was designed not to confine its scope to cotton and the interests germane to it, it was deemed appropriate that it should derive its name from the great staple product which forms the basis of Southern industry. While prominence was given to cotton and everything relating to its production and manufacture, care was taken to embrace all other branches of industry.

Agricultural Implements and Machinery.—The collection of implements for the cultivation of cotton, and of machinery for preparing, packing, spinning, and weaving it, and for the treatment of cotton-seed for every purpose for which it is used, was the great feature of the exhibition. It has never been equaled in variety and number of articles in any former display, and it is doubtful if it can be excelled until the inventive genius of the future shall have outstripped its capacity in the present time. Here were displayed plows of every size and shape for the mechanical improvement of every kind of soil, from the four-horse screw pulverizer of the Maywood Company, of Chicago, Illinois, capable of breaking from twelve to twenty acres per day with one hand, to a depth of seven inches, to the graceful pony chilled plow of the Niles Chilled Plow Company, of Niles, Michigan; universal riding plows, steel plows, sulky plows, chilled plows, subsoil plows, garden plows, adamant plows, pulverizer plows, in apparently endless number. Here were harrows, cultivators, scrapers, choppers, seed-sowers, fertilizer-distributors, seed-drills, manure-spreaders, cotton-pickers, the capacity and ingenious construction of which amazed the farmer, ignorant of their existence and accustomed to the use of the primitive implements hitherto employed in the preparation of the soil and the cultivation of his crops. The sight of these "implements of precision," each fashioned to perform its destined work in the best possible manner, in the quickest time, and with the least expenditure of manual labor, showed him how time, labor, and money could be saved, and the yield of his crops at the same time largely increased. As an evidence of the extent to which the Southern farmers have learned the lesson

taught by this branch of the exposition, the most approved of these implements are being ordered in greater numbers than the manufacturers can supply them. The makers of the Thomas smoothing harrow, of Geneva, New York, received orders from Southern farmers for upward of 1,000 harrows, costing from \$20 to \$22 exclusive of freight. The Chicago screw pulverizer and seeder attracted considerable attention, and when seen in operation was said to fulfill satisfactorily all that its makers claimed for it. Of the machines which could be classed as "labor-saving" in the department of farm implements, this was pre-eminent. With it an intelligent farmer can plant his crops at half the cost of the ordinary plows. It cuts a strip eight and a half feet wide and from three to seven inches deep, dependent on the angle at which the cutting-blades are adjusted. Driven by one man and drawn by four horses, it will scarify and pulverize from fifteen to twenty acres in a day; and when used as a seeder it will sow and cover upward of twenty acres of wheat, oats, rye, barley, millet, peas, and grass-seed. The ease with which four horses can break so much soil is attributable to the fact that the horses draw upon a lever like a wagon-wheel, on the same principle that they can draw a heavier load upon a wagon than on the ground. It is not pretended that the machine will work on wet, rocky, stumpy, or hilly ground. After the crop comes up the machine can be taken apart in two sections, and each section used as a cultivator, stirring and cleaning thoroughly the entire space between two rows of corn or cotton. A special prize of a gold medal, or \$100, was awarded to this machine. The Globe Cotton Planter of the Remington Agricultural Company, to which a similar mark of distinction was adjudged, was also universally commended for the thoroughness, with the least amount of manual labor, with which it performed its work. The collection of agricultural implements suited to Southern husbandry, exhibited by Brennan & Co., of Louisville, Kentucky, was much admired, and public opinion fully justified the award of a gold medal which the judges recommended. The cotton-pickers, of which four were exhibited, showed a great deal of mechanical ingenuity, but practical farmers did not believe that they furnish a reliable substitute for the fingers of the darkey. A cotton-worm-killer, invented and exhibited by Jackson Warner, of Texas, was an ingeniously devised implement, certified by numbers of persons who had tested it to be thoroughly effective in destroying the cotton-eatepillar, army-worm, boll-worm, and other insects which are so destructive of the cotton-crop. The machine, filled with the poisonous liquid, which, unlike Paris-green and other worm-poisons, is not injurious to those who apply it, is strapped on the withers of a horse or mule in front of the rider, and distributes a shower on each side

which is said to be as efficient in the destruction of "blind-worms crawling in the grass," as the miraculous agency of St. Patrick. One man and horse, with this machine, in the course of a day, can kill the worms on a large cotton plantation. The display of cotton-gins was very large. One of the main objects which the exposition was expected to demonstrate was a gin made on the knife-roller principle, which would equal in speed and in quantity of lint the ordinary saw-gin. While one or two proved capable of somewhat higher speed than any roller-gin hitherto seen, none of them came near enough in ginning power to the saw-gin to warrant the belief that they will take its place on cotton-farms. In the vast number of gins displayed, some very simple, some quite complex, in their construction, it was remarkable that the foundation principle of them all is precisely similar to that the invention of which has made Eli Whitney as famous as Watt throughout the civilized world. The modern gin is of course a great improvement on that of Whitney—an exact model of which was exhibited and was an object of much interest—but the scientific principle, though amplified and perfected, is the same. Another anxiously anticipated result of the exposition was the production of a machine which would cleanse cotton thoroughly from the motes, consisting of bits of leaves, bolls, and trash from the field, dust and trash from the gin-house, and which would remove the almost impalpable sand or dust which is found in cotton grown on many soils and does great injury to the machinery of the factory, and which would thus benefit the producer by enhancing the value of his crop, particularly that known as "storm-beaten" cotton. It is estimated that the present rude method of preparing cotton for market costs the producer at the lowest calculation from two to five per cent on his entire crop. In other words, if all the raw cotton were properly ginned and cleansed from the above-mentioned impurities, and then properly packed, so that no rain or dirt from the bagging or yard could penetrate it, the value of the larger part of the entire cotton-crop would be enhanced five per cent to the producer and probably as much more to the consumer. The profit to the latter from well-cleansed and well-baled cotton would arise partly from the saving of time and labor now spent in picking and carding, but mainly from the greater strength of the yarn, which is now much injured by the mechanical appliances employed in factories to remove the trash and dust. Machines to do this important work were exhibited by Joseph Ralston, of Brenham, Texas, and by the Clark Seed-Cotton Cleaner Manufacturing Company, of Atlanta, Georgia. The machines of both inventors were highly approved by large numbers of farmers who had fully tested their merits, and who stated that by their use "storm-cotton" had been enhanced in value from three to four

cents per pound. The display of their power to do what is claimed for them, which was made daily at the exposition in presence of numbers of practical and intelligent planters and manufacturers, proved beyond question that they are of incalculable value. The *modus operandi* in cleansing dirty cotton is to subject it to the action of "beaters" before the fiber has been removed from the seed. The seed with the lint attached, being of greater specific gravity than the trash, dust, etc., mixed with the lint, is detached and carried by the action of the beaters away from the trash, and the trash is deposited in receptacles prepared for it. The judges, believing that the Ralston Cotton-Cleaner is the best that has ever been devised for the accomplishment of the long desired end, awarded it the "Grand Prize of the Exposition"—five hundred dollars, or a piece of plate of equal value. The Clark machine had also great merit. It was distinguished by the award of one hundred dollars in money or plate. The demand for these machines is now so great that the Ralston and Clark factories will find it difficult to fill the orders already received. An intelligent planter of large experience—an extensive cotton-grower—remarked, when looking at the cotton-cleaner at work, "That machine alone is of sufficient value to pay the South the cost of the entire exposition ten times told." This is no exaggerated estimate. Of the 6,000,000 bales of cotton now produced, far more than 1,000,000 bales are graded as "ordinary" and "low-middling," in consequence of the trash, sand, and dirt which they contain. A machine which would remove this trash, and give to the price of even 1,000,000 bales an addition of one cent per pound, would add \$5,000,000 to the annual value of the crop.

Of cotton-presses with power sufficient to compress a bale of cotton so as to make it impervious to rain or dust, under the rough treatment it receives when in transit between the gin-house and the factory, several were exhibited. One press, that of P. K. Dederick & Co., of Albany, New York, displayed power to compress a bale to forty pounds to the cubic foot, giving it the density of elm-wood, without, as is alleged, any injury to the fiber. The main advantage of this compression accrues to the carrier by land and sea. The good effected by making the bale proof against rain and dust is done away by the increased difficulty caused by compression in removing motes and other trash from the lint. The price of these powerful presses is so great, and it being by no means a settled question that great pressure does not injure the elasticity of the fiber, that farmers in general are not likely to purchase them.

Another agricultural machine well worthy of notice was Kemp's Manure-Spreader. It is a cart with large broad-tired wheels, capable of holding between 30 and 40 bushels of ordinary manure, with a short tongue to connect

it to the front wheels of a farm wagon at the king-bolt. The bottom is movable, which by simple machinery, when in gear, moves slowly between the sides of the body, carrying the manure to the rear, where it meets a rapidly revolving cylinder, armed with strong iron teeth, which tears the manure into shreds and scatters it in an even shower as the team moves forward. It grinds to powder and spreads smoothly all sorts of manure, from the coarsest and wettest to the finest and driest. A simple device regulates exactly the amount to be scattered, and scatters it either broadcast or in the drill, as may be desired. The machine was abundantly tested while on exhibition. The perfect uniformity and speed with which it does its work, render it a very desirable addition to the farm machinery of large farmers, or of any who can afford to pay the price which the manufacturers charge.

Next in interest and in value to the cotton-grower and the stock-raiser were the machines for utilizing cotton-seed—for milling, grinding, and expressing the oil. Previous to 1860, comparatively little was known of the value of cotton-seed, or of the uses to which it might be applied. In many places where the lands were very productive without the use of manure, as in the alluvial lands of the Mississippi Valley, the cotton-seed was either burned or thrown into the river to get it out of the way. Where it was used as a fertilizer it was applied fresh as it came from the gin, or in a half-rotted state. Since then it has been demonstrated that cotton-seed properly treated may be made to yield the best fertilizer, the most nutritious food for stock, and the purest oil for various purposes. Estimating the cotton-crop at 4,000,000 bales—as low as it is ever likely to be—the amount of seed produced is 120,000,000 bushels, or 3,600,000,000 pounds = 1,800,000 tons, worth, at \$12 per ton, \$21,600,000. Worked in a mill, that is, decorticated, the oil expressed and the kernel ground into meal, every ton of seed will yield 60 to 80 pounds of lint which the gin did not detach, fit to make paper; 900 to 950 pounds of hulls; 60 to 80 pounds of oil, and 500 to 600 pounds of meal. It is evident that where the raw seed was applied to the land, which was far from being the general practice, all the above valuable articles were lost to commerce, and the land not as effectively fertilized as by the application of the meal, because the nappy cotton and the hull prevent the access of moisture and retard decomposition, and because the oil is not only not a source of fertility, but an obstacle to the usefulness of the seed as a manure. But if we assume that only 900,000 tons of seed are available for treatment in mills, we then have 54,000,000 to 72,000,000 pounds of cotton, 810,000,000 to 864,000,000 pounds of hulls, 54,000,000 to 72,000,000 pounds of oil, and 45,000,000 to 54,000,000 pounds of meal, thus adding to the wealth of the cotton States about \$30,000,000 annually from what has been, to a great

extent, a waste article. The value of the meal and of the ashes of the hulls as a fertilizer, and of the meal as a stock-food, has been proved beyond question. Within the past few years several cotton-seed oil-mills, some on a large scale, have been started in the Southern States—at New Orleans, Louisiana, at Memphis, Tennessee, at Selma and Eufaula, Alabama, at Augusta, Georgia, and other places, and one is about to be established at Atlanta, Georgia—at most of which the farmers can obtain for their seed their produce in cake or meal, the mill retaining the oil and the hulls. Several cotton-seed hullers and grinders suitable for plantation use were exhibited, whereby the seed is thoroughly decorticated and the kernel ground into meal for stock-food or for fertilizing purposes, of which large numbers were purchased. No machine of moderate price for expressing the oil was exhibited. The necessary machinery for an oil-mill of average capacity costs from \$20,000 to \$25,000; the hullers and grinders from \$75 to \$150. That made by David Kahnweiler, of New York, received the first prize.

If the method of saving green crops, called "ensilage," which has been recently introduced into the United States, though it has been long in use in Europe, proves to be what its enthusiastic advocates claim for it, a sufficient number and variety of "ensilage-cutters" were exhibited to insure the speedy and thorough execution of the cutting part of the work. In the cotton States, where the winter is so short, and where cattle can find abundance of succulent pasture in the woods and canebrakes nearly all the year, the necessity for ensilage, which involves considerable outlay and labor, is not as urgent as in those latitudes where the climate is more severe.

As the limits of this notice of the exposition render a detailed report of the exhibits in every group impossible, and only permit mention of those things which attracted most attention on the part of those for whose improvement the exposition was designed, many exhibits of value and merit must necessarily be passed over. Though it does not come strictly under the head of farm machinery and implements, the barbed-wire fencing material, of which there was a very full display, may be appropriately noticed here. Nothing seemed to interest the visitors more than this, because the belief is growing rapidly that no more expensive, inefficient, hideous, or wasteful fence can be imagined than the prevailing rail- or worm-fence which now disfigures the face of nature; and, further, because economy in the use of the timber that is left in the older States, after so many years of improvident use of it, is fast becoming a generally recognized necessity. A combination of the barbed-wire and plank is the fence which is most approved, it being feared that the slender wire alone, which is hardly visible at a distance, may wound and injure stock. In a period of ten years a well-constructed wire-fence, made of any of the

various forms that were exhibited, will certainly cost less than any rail-fence, without taking into account the loss of land covered by the "worm," or the hindrance to tidy culture which the rail presents.

It has been found of late years that the culture of upland rice might be made a profitable industry, if a cheap hulling-machine could be invented, such as small farmers could afford to buy. The mills used on the large rice plantations for preparing rough rice are very expensive. Two machines for this purpose, of moderate price, were exhibited, which seem to supply the want, and, if this proves to be the case, the growth of rice may be extended indefinitely beyond the lowlands on the coast of South Carolina and Georgia. The rice cleaner and polisher of William C. Howard, of Grahamsville, South Carolina, received the gold medal, or \$100. Mowers and reapers, thrashing-machines, separators and cleaners, of the finest make, were represented in goodly number, and, considering their high price, have been extensively purchased by those farmers who have had the wisdom to increase their crops of small grain and of the grasses, with a view to make their farms self-sustaining. On many farms where, in the past, wheat and oats, barley and rye, grass and clover, were harvested with the old-fashioned cradle, the rapid click of the mowers and reapers seen at the exposition will be heard this year. The display of agricultural implements and machinery may be truly called, as Mr. Edward Atkinson has remarked, "an exhibition of the beginnings of new processes, and for the correction of the errors in old methods—an exhibition of the potentialities of the future," and in this consists its value to the agriculturists of the South.

Minerals and Woods.—No department of the exposition exhibited so forcibly the wondrous nature and extent of the material resources of the Southern States as that devoted to the display of minerals and woods, collected chiefly by the leading railroad companies. Here were collected, as Mr. Killbrow (in charge of the department) remarked, "every mineral that contributes to the arts and every variety of timber which grows between the St. Lawrence and the Gulf of Mexico." These specimens of the products of the mines and forests gave undeniable and tangible proof of the practically limitless and hitherto undeveloped resources of the South, so that it is reasonable to expect that in the near future a quickening impulse will be given to all kinds of industrial development to which this region has until now been a stranger. A detailed description of the ores and woods would far exceed the limits of this notice. The collection of minerals, of forest products, and of hard and ornamental and useful woods, presented by the Richmond and Danville Railroad Company, received the highest prize—certificate of award, and cash premium of \$200. The collections by the West-

ern and Atlantic Railroad of Georgia; by the Great Northern and Texas and Pacific Railroad; by the Louisville and Nashville Railroad; by the Georgia Pacific; and by the Nashville, Chattanooga and St. Louis Railroad, though not as large as that of their more successful competitor, were equally interesting and instructive, and received appropriate commendation from the judges. The richness and comprehensiveness of their displays, gathered and prepared in great haste, surprised the railroad managers who made them. These various collections of minerals and woods will not be scattered. They will be permanently preserved and enlarged. That of the Richmond and Danville Railroad has been removed to Richmond, Virginia, where it will constitute a valuable illustration of the mineral and forest wealth of the States which that road traverses. That of the Western and Atlantic Railroad has been moved to Washington, where it will be arranged in the Museum of the Department of Agriculture. A large portion of the other exhibits has been moved to Athens, Georgia, to be placed in the Museums of the State College of Agriculture and the Mechanic Arts of the University of Georgia.

Steam-Engines, etc.—The display of engines, and of the implements and apparatus used in connection with them, was large and of great variety as to shape and power, but there was nothing specially new in their construction or application. The traction-engines from Aultman & Co., Canton, Ohio, and Gaar, Scott & Co., Richmond, Indiana, and other manufacturers, and the vertical engines of one, two, three, four, five, six, eight, ten, and twelve horse-power, from the New York Safety Steam-Power Company, New York (the latter received the highest award), were among those most worthy of particular notice. It is gratifying to observe the extent to which steam is taking the place of horse-power in the work of the farm wherever it is applicable. There were several steam saw-mills, with gang-saws, circular saws, band-saws, etc., the machinery of some of which was in action, which were much admired for their speed and precision. Those of Lane & Bodley, Cincinnati, Ohio, were awarded the gold medal. There was also a fine display of machinery and tools for breaking and dressing stones, and for working wood and metal. The machine for the manufacture of steel-barbed fence-wire was the most noticed, from its novelty, and that of the industry which it has created. In the group designated "transportation," including pleasure-carriages, phaetons, buggies, etc., etc., the exhibit was meager and unattractive. Under this head were exhibited coffins, undertakers' supplies, metallic caskets, described as "ornamental," "full ornamental," and "half ornamental," which seemed to justify the description. In classifying the means of transportation, it was appropriate to begin with the baby-carriage, of which there were many specimens, then pass

to the pleasure-carriage, and wind up with the "full ornamental metallic casket."

Manufactures, Textile.—This department included cotton yarns, cloth, and prints, and other vegetable fabrics, from the gossamer muslin to the coarsest unbleached homespun, from the finest lace to tent-canvas, from the most attenuated spool-thread to cable-rope. The exhibits of the Northern factories were as fine as could be expected. They represented everything that cotton is capable of producing under the application of the highest inventive genius and mechanical skill. While every one admired, no one was surprised at this display. But every one was surprised and gratified by the excellence and wide scope of the productions of the Southern cotton-factories which were exposed. They did not present anything comparable in size with the immense exhibit of the Willimantic Linen Company, the largest at the exposition, and the one which presented, perhaps, the best view of all the details of cotton machinery; but in the substantial of "cotton goods"—sheetings, shirtings, drillings, prints, yarns, muslins, jeans, and cotton blankets—the Wesson Mills, of Mississippi; the Augusta Factory; the Summerville Mills, of Augusta, Georgia; the Eagle and Phoenix Manufacturing Company, of Columbus, Georgia; the Alabama and Georgia Manufacturing Company, of West Point, Georgia; the Roswell Manufacturing Company, of Roswell, Georgia; the Langley Mills and the Piedmont Mills, of South Carolina, proved that they had made giant strides in the race with their older and wealthier rivals in Lowell, Fall River, and Providence. This was a cheering manifestation of the "potentialities of the future," and encourages the hope that the *esse* of 1892 will fully realize, if not surpass, the *posse* of 1882 in the estimate of the most sanguine.

The Chinese and Japanese fabrics and garments exhibited by Mr. Atkinson in this department, showing the coarse, rude material and clothing used by nine tenths of the teeming population of China and Japan, were of extreme interest, and suggested another "potentiality" of immense proportions, interesting alike to the cotton-grower and to the cotton-manufacturer, when the machine-made cloth of the United States shall be more generally worn than at present by the 400,000,000 of China and the 40,000,000 of Japan. It is estimated that in both of these countries each person needs twenty yards of cotton cloth every year, making 8,000,000,000 yards needed for China, and 800,000,000 yards for Japan. Statistics show that only 641,760,960 yards of cotton cloth are exported to China, enough to clothe 32,088,040 people, thus leaving 368,000,000 to be clothed with the native handloom cloth, which is not only vastly inferior in quality, but costs more than the machine-made cloth of our factories.

The display of silk, spun and woven, was worthy of note, especially the exhibit of Mc-

Kittrick, Wallace & Co., of Memphis, Tennessee, showing "raw silk, spun silk, silk floss, woven silk, twisted silk, silk-worms spinning silk, silk cocoons, silk butterflies, silk-worm eggs, and silk-worms feeding, all made, raised, and cultivated in the South." It is said that silk-worms will feed and thrive as well on the leaf of the Osage orange as on the leaf of the celebrated *Morus multicaulis*, which created so much excitement at the South several years ago, and that the worms that make the wild silk of Northern China feed upon oak-leaves of the same variety of the genus *Quercus* as that which grows luxuriantly on the mountains of Virginia.

The number of the machines for textile manufacturing was legion—cotton cards of all sorts, looms of every variety, spinning-frames, spindles, spoolers, reels, threaders, shuttles of every kind, with a full display of sewing-machines, whose peculiar merits were deftly displayed by operators of remarkable skill. The button-hole machines of the American Button-hole and Sewing-Machine Company, of Philadelphia, were especially noticed.

Miscellaneous.—In the groups of the departments comprising printing and telegraphy, breaking and dressing stone, furnaces and pumps, chemical and pharmaceutical products, soaps and perfumery, bricks, tiles, terra-cotta and glassware, fire-arms, etc., railway supplies, etc., the exhibits were numerous and interesting, but there was nothing among them specially new or remarkable.

The Art-Gallery.—The works of art, properly so called, in this department, were not numerous, and of no marked merit. The portraits of General Ogleshorpe and of James Habersham, exhibited by John Milledge, Esq., grandson of Governor Milledge, were interesting in an historical point of view. There were some good steel engravings, and a very creditable display of photographs, mostly portraits of local celebrities, displayed by C. W. Davis, of Athens, and C. W. Motes, of Atlanta, Georgia. Some sets of mantel-tiles, and a terra-cotta group from the Franckelton China Decorating Works, Milwaukee, were much admired and received the highest award. The antiques and art-bronze of Sypher & Co., of New York, were equally distinguished by the judges. The display of watches, clocks, jewelry, precious stones, and silver-ware was rich, and always attracted a crowd of admiring gazers. The Jacquard Jewelry Company, of St. Louis, Missouri, made the largest and most costly show. A set of silver-ware manufactured by them for presentation to Mr. Paramore, of St. Louis, was more massive and elaborate than elegant. They also exhibited some graceful specimens of *repoussé* work. The jewelry was pretty, and the setting of precious stones would compare favorably with that of any other house in the United States. The exhibit of watches was exclusively American, some made by J. P. Stevens & Co., of Atlanta.

Watches of all shapes, sizes, and movements were to be seen, from the finest gold-incased chronometer to the five-dollar nickel watch, of one of which every colored man of any pretension to refinement strives to be possessed. The Waltham Watch Company made a fine display. Their watches not only excel the old hand-made timepiece in cheapness, but in the uniformity which machinery gives to all their parts, as well as in the simplicity and perfection of their construction. A number of new improvements in watchmen's time-detectors were exhibited. In a prominent place in this hall was a case of artificial limbs of ingenious mechanism, which was doubtless interesting to the number of armless and wooden-legged soldiers of the "lost cause" who visited the exposition. Of *articles de luxe* the number was very small, and it was, perhaps, better that it was so, as the object of the show was strictly utilitarian. The Ralston cotton-cleaner was, *par excellence*, the work of art which represented most fully the purpose of the enterprise, and which was best suited to the wants of the people for whose benefit it was intended. There were several exhibits of pianos, organs, and other musical instruments, the pianos of Knabe and the organs of Carpenter, of Massachusetts, being adjudged of the highest merit.

Agricultural Products.—This was a full and thoroughly representative exhibit of the agricultural resources of the Southern States. Cotton, corn, wheat, oats, barley, rye, buckwheat, rice, sugar-cane, sorghum, tobacco, sweet-potatoes, Irish potatoes, hay, cotton-seed, grass-seed, small seeds of every kind, were displayed in seemingly endless variety and in every degree of excellence. Oranges and lemons from Florida, surpassing in size and flavor those of tropical climes; canned and preserved fruits, from Thomasville, Georgia, equal in color and faultlessness to those of Pennsylvania and New Jersey; and wine from Thomasville, Georgia, from Nashville, Tennessee, from Fayetteville, North Carolina, and from Greenville, South Carolina, which, if it did not rival the vintages of France, Spain, and the Rhine, showed that ere long wine-culture may become one of the leading industries of the States which furnished these samples of their present skill. Cotton, as was natural, was pre-eminent in this display. Its majesty was fully recognized. Georgia's display was the largest, but Alabama, Arkansas, Texas, Louisiana, Mississippi, Florida, Tennessee, South Carolina, and North Carolina, were admirably represented. The contest for the great prize of \$1,000 was very close. It was hard for the judges, as they passed from the examination of one bale to another, to decide which excelled in fineness and length of staple, or in unspotted, creamy purity. As one looked on this aggregated excellence and remembered the part this staple product now plays, and may yet play in ministering to the comfort of the human race, obeisance to King

Cotton became irresistible. The conditions of the first prize were that the cotton should be other than long staple, the growth of 1881; that it should be ginned and baled in the usual way; that the lint should not be hand-picked from the seed, or carded; and that no bale should compete which had not won the lower prize of \$100 adjudged to the best bale from each of the competing States. There were thus nine competing bales, each of which had received a prize of \$100, namely: From Georgia, property of W. S. Sanford; from Alabama, W. S. Brock; from South Carolina, F. A. SchumPERT; from Tennessee, Porter, Taylor & Co.; from Arkansas, M. B. Garrison; from Louisiana, L. Steeve; from Texas, B. F. Oakum; from North Carolina, M. McGehee; from Mississippi, Watkins & Houston. The Mississippi bale, raised near Panola, carried off the richest prize of the exposition. For the best bale of upland long staple Mississippi received the prize of \$300, that being awarded to the bale exhibited by J. B. Allen, of Vicksburg. For the best bale of Sea-Island cotton, W. J. Epperson, of Florida, was awarded the prize of \$100. Prizes were offered also for the best twelve stalks of cotton other than long staple, and for the best twelve stalks of upland long staple. This was, to the general observer, a more interesting competition than that of the bales, as it enabled those who were unfamiliar with the cotton-plant to see it in all its parts—stem, root, leaves, bloom, fruit, and seed. In this contest, a lady, who manages her own farm and is a very successful planter, won the prize. Her name is Miss Sallie McRae, of Walnut Grove, Georgia. Some bales of dressed hemp, of excellent quality, were exhibited, and one of them from Florida. There was also a bale of dressed jute, to all appearance as good, in every particular, as that imported from India. Here is another "potentiality." At present, the greater part of the bagging used in baling cotton and for other purposes is of foreign growth and manufacture. When it is seen that as good an article can be raised and made at home, and at far less cost, the industry and capital will not, it is hoped, be wanting to utilize this fiber. It is claimed, too, for jute, that when it is planted round a cotton-field, cotton is perfectly protected from the caterpillars. It is supposed that the peculiar odor of the juice of the stalk repels them. There were several fine specimens of the hair of the Angora goat exhibited by R. W. Scott, Frankfort, Kentucky, which warrant the hope that this will soon assume an important place among American fibers. It was also proved that the successful culture of the olive on a large scale is among the not remote possibilities. The display of small grains, fruits, etc., was very full and gratifying. Kansas erected a trophy in the form of a pagoda, thirty or forty feet high and ten or twelve feet square at the base,* in which were

* These dimensions were not ascertained by actual measurement.

arranged, with admirable taste and skill, samples of the products of her fields, gardens, and orchards. The gentlemen who planned and executed this attractive feature of the exhibition, at considerable cost of time and money, were universally commended for their public spirit, and for the originality of the design of their display.

The large number of samples of cotton raised in India, Ceylon, Burmah, China, Java, Siam, Egypt, Australia, and a number of other countries in the East, the Indian Ocean, and the South Pacific, exhibited by Mr. Atkinson, were closely examined, and attracted much interest, chiefly because they seemed to satisfy the cotton-growers who inspected them that the supremacy of the cotton raised in the Southern States is assured, by comparison with these specimens.

Special Weekly Exhibitions.—During the exposition there were a number of special exhibitions, which lasted for a few days, and created considerable interest: on the 25th of October, a display of fruits and flowers, which did not give an adequate view of the floral and horticultural wealth of the South; on November 1st, an exhibition of cattle and mules; on November 8th, one of sheep and swine; on November 15th, a bench-show of dogs; on November 22d, a show of poultry; and on November 29th, a display of dairy products.

The opportunity afforded by the large concourse of people at the exposition was used to hold several conventions for special purposes, the largest and most important of which was the Convention of Planters, held in November, which was largely attended by representative men from every State. There were also several meetings of manufacturers, merchants, etc., and a National Association of Exhibitors was formed, which met frequently while the exposition was open.

The Legislatures of Kentucky, Tennessee, and South Carolina came in a body to visit the exposition; a number of Governors of States, several United States Senators, and members of the House of Representatives from all parts of the Union, came to see the "World's Fair," and met there thousands of earnest, enterprising men, representing every industry and every section, come together to see and be informed. Several of these meetings were of very great value, and, in the course of their discussions, elicited the rich results of advanced thought in their several specialties.

The Close of the Exposition.—The exposition closed with appropriate and impressive formalities on December 31st, in conformity with the arrangement made by the managers. The officials, with Governor Colquitt at their head, the chief officers of the State government, and a large number of distinguished guests, exhibitors, and visitors, filled the Judges' Hall at the appointed hour. After prayer by Bishop H. W. Warren, of the Methodist Episcopal Church, Mr. Kimball, Colonel William C. P. Breckin-

ridge, of Kentucky, and Governor Colquitt, delivered eloquent addresses, well worthy of the large and appreciative audience and of the occasion. The following are the closing sentences of Governor Colquitt's speech, which was loudly applauded:

Great as is the knowledge which this exposition has sent broadcast over the world of our resources and material possibilities, it is outranked by the glorious results which have been secured by three months' close and unreserved communion of hearts and minds. The sterling worth of American character has only brightened under the attrition of friendly contact.

Here let me say, in the solemnity of this parting hour, that we cherish the belief that not since the days of '76, when the pressure of mortal peril united all hearts, has fraternal sympathy so abounded, so diffused itself among our people, as at this very hour. Here we came together inspired by the purest motives and purposes. Not one oblique or unworthy influence actuated us. It was good, and good in all things that we sought, and Heaven has signally blessed our enterprise so nobly inaugurated.

Let the verdict, which tens of thousands of admiring witnesses have pronounced upon the wonderful courage and industry of the guiding spirit of this grand enterprise, and the fidelity and intelligence of his faithful co-laborers, be ratified by us in this closing hour!

Now, before I shall pronounce the word that shall still for ever the busy and ever-memorable scene that lies before our eyes, let me, in behalf of every patriot who shares with us the hope and joy of a united people, beseech that each contributor to this great display will give a solemn pledge that he will be true to the kindly impulses born of this exposition, and that he will promote and defend a union of hearts of the North and the South, of the East and the West. In this covenant the officers of this exposition do most heartily unite, and may all the people say, Amen!

And now, in the joy of the triumphant conclusion of our labors—in the full hope and confidence of the grand results yet to be realized—I give the signal which announces to the world that the International Cotton Exposition is at an end.

When Governor Colquitt finished his speech, he immediately touched the electric spring under his hand, the great bell outside struck three loud strokes as the closing signal, and when the long-metre doxology had been sung by a trained chorus of a hundred voices, at 3.30 p. m., the exposition closed, after nearly three months' successful existence. When the shortness of the time between the inception and the completion of the enterprise, the total inexperience of the managers, and the many circumstances of discouragement which surrounded it are considered, an exhibition in a town of less than 50,000 inhabitants, which receives the co-operation of upward of 1,800 exhibitors, and attracts 286,895 visitors, may be justly considered a success. But it had a significance apart from and higher than that which belonged to its exhibits of agricultural machinery and products of mine, field, and forest, great as is the stimulus to improvement which these have given the entire people from the Potomac to the Rio Grande, and from the blue-grass region of Kentucky to the piney woods of the Gulf coast. It has two results of transcending importance, which in the near future will have a beneficent influence on all the States of the

Union, namely, first, it has proved to ocular demonstration the immense and varied undeveloped resources of the South; and second, by the interchange of ideas, opinions, and courtesies between intelligent and reflecting men of both sections which it afforded, the men of the North and of the South have learned to esteem each other more, to see the fallacy of the depreciative representations by unscrupulous politicians on both sides, by which they were respectively misled and estranged, and by dissipating the prejudices which made Georgia a *terra incognita* to the citizen of Massachusetts, and Maine a remote foreign country to the citizen of Georgia, to promote social and commercial intercourse between them, and finally exert a good influence in shaping the policy of the Federal Government.

The financial result of the enterprise may be stated in round numbers as follows:

Cost of buildings, etc.....	\$160,000
Running expenses.....	100,000
Total.....	\$260,000
Subscriptions.....	\$120,000
Entry-fees, gate-receipts, etc.....	135,000
Sale of buildings.....	25,000
	<hr/> 280,000
Leaving for distribution to stockholders.....	\$20,000

When all the accounts are paid, it is not improbable that this apparent surplus will be reduced to zero. As none of the stockholders expected any return when they subscribed, and as they contributed with a view only to promote the success of a "World's Fair" at the South, the number of dollars to be returned to them is not a matter of any moment.

The buildings have been purchased for \$25,000 by a stock company, who have also bought the land from the city of Atlanta for \$15,000, with a view to establish immediately a cotton-mill with not less than ten thousand spindles, with capacity of increase to twenty thousand, and with looms sufficient to weave the yarn from all the spindles employed. The name of the factory is to be the "Exposition Cotton Mills."

EYE-SIGHT, ITS DEFECTS AND TREATMENT. In no branch of practical science has there been greater advance in recent years than in that which pertains to the structure and functions of the human eye. Perhaps the most important conclusions lately reached are those which have definitely determined the method by which the vision is adapted to near and remote objects, and have ascertained the best means of preserving this power and of rectifying its deficiencies. The similitude of the eye to the camera of the photographer is quite familiar. It is well known that the rays of light proceeding from external objects enter the eye through the cornea or projecting horny substance in front, pass through the pupil, or opening in the iris, into the dark chamber of the eyeball, and are there brought together by means of a lens so as to form an inverted picture of the object on the retina at the back of

the chamber, which retina is a screen formed by the outspread fibers of the nerve that comes in from the brain. But while there is here a distinct analogy between the eye and the *camera obscura*, there are differences which are curious and important. In the photographer's instrument the rays are brought together on a flat surface, and no combination of lenses has yet been contrived to overcome completely the disadvantage of sharply defined details in the center, shading off into indistinctness about the edges of the picture. The maximum angle subtended by the field within which a tolerably clear image can be obtained is forty-four degrees, while in the eye, owing to the concave surface on which the rays are received, a field of one hundred and sixty degrees is obtained. The vision is not sharp over all this area, owing to the constitution and distribution of the nerve-fibers of the retina. In fact, the area of clearest sight is very restricted, but the relatively large surrounding surface of inferior sensitiveness serves the purpose of giving notice of the presence of objects in a wide field of vision, and guiding the eye to a closer scrutiny of them by means of its wonderful facility of movement. The optic nerve, which enters the back of the eye from the brain and constitutes the channel of visual impressions, is a white cord nearly one sixth of an inch in diameter, and is composed of fine threads, at least 250,000 in number. These spread out to form the retina, which is rather a mosaic pavement than a true net-work. The ends of some of the threads turn back upon themselves and form relatively thick cones of nerve-matter, while others terminate abruptly in rod-like ends. These are distributed somewhat irregularly, being closest only at one central point directly back of the pupil. This is the one spot of supreme sensibility, and, being slightly depressed, is called the *fovea centralis*, or central pit of the retina. It is constituted entirely of the cone-like terminations of the nerve-threads, relatively small in size and closely packed together, while around it is a less compact arrangement of the cone-like and rod-like terminations. Hence the visual picture is defined with consummate clearness only at this point, and presents a departure from the camera in the shape of an intensification of its chief defect, which in the eye thus becomes a part of its exquisite perfection, for the large area upon which the light falls affords a wide field of impression sufficiently sensitive to give notice of the presence of the objects which are reflected upon it, while the fine mechanism by which the eye is moved with a facility, quickness, and accuracy that are marvelous, brings the slight area of perfect vision to bear upon the particular object to be scrutinized or the different parts of that which is merely looked at. Therefore, we have practically combined perfect distinctness of the visual picture and a wide field for its reception. The camera fixes its glance upon a narrow field, and forms a picture with a clear center and

obscure or blurred outskirts. The eye sweeps its glance over a wide range, and forms clear pictures of every part of the field in such rapid succession as to receive the impression as a whole. This effect is, no doubt, promoted by the curious anomaly that, while the vibrations of light pass through a distance of 200,000 miles in a second, the nerve-influence passes from the eye to the brain at the comparatively sluggish rate of only two hundred feet in a second.

But the most important difference between the eye and the camera, and one that has only recently been fully understood, is to be found in the means employed for adjusting the instrument to the reception of light from near and remote objects. The lenses of the camera have each a constant focal length; that is, they bring parallel rays together at a certain distance from their own plane. If the rays are divergent when received, a part of the power of the lens is used up in bringing them parallel, and it must be farther from the screen, in order to concentrate the image distinctly upon it. So, if they are partly converged already, the lens must be nearer the screen. Hence, by moving the lens forward or back, the adjustment to near or distant objects is made. It was formerly supposed that the eye had some such power of elongating and compressing itself along the axis of vision, but this has been entirely disproved. Its mode of adjustment is entirely different. The eyeball is a sphere kept in shape by the fluids contained within its strong walls. These fluids serve a further purpose, not completely understood, in connection with the lens, in refracting the rays of light, but the lens alone contains the power of adjustment to distances. It is well established that there is a constant adjustment of the power of vision to the distance of objects. When the sight is fixed upon near objects, distant ones in the same direction can not be distinctly seen, and *vice versa*. Donders, the Dutch physiologist, furnishes a simple but effective illustration of this peculiarity of eye-sight. If a net is held between the eyes and a printed page, the attention may be fixed on either the net or the page, and either can be distinctly seen, but not both at once. The attention may be rapidly transferred from one to the other, and the process of adjustment will follow it. The change which takes place is wholly in the form of the crystalline lens, not in its position or the shape of the eye. This lens is suspended back of the iris and between the aqueous and vitreous humors. It is contained in a sort of sheath or shell of a slightly horny texture, which is set in a circular rim. This rim is stretched out in all directions and held firmly in place by seventy radiating elastic bands. These bands are about one fifth of an inch in length, and are attached at their extremities to the outer coat of the eye. They stretch the lens to its fullest circumference, maintaining a certain flatness which adapts it to the light from distant objects, so as to bring it to a perfect focus

on the retina. Connected with these elastic bands is a series of muscular fibers acting antagonistically to their elasticity; that is, when the muscles contract, the bands relax and allow the lens to bulge to a greater convexity, it having a natural tendency to do so when not stretched out. When the muscular fibers are brought into action so as to increase the convexity of the lens, the vision is adapted to near objects; and it is the constant play of the elastic bands and muscular fibers, together with the ready movement of the eye, that adapts the sight to objects at all ranges of distance and direction. The expansion and contraction of the iris, so as to admit more or less light at once, add effectiveness to the marvelous contrivance by which the impressions of the external world are conveyed to the brain. It is manifest that the eye must be in constant action during the hours of wakefulness, and that its delicate mechanism is subjected to a strain from which the only absolute rest is sleep or complete darkness.

These conclusions regarding the method by which the power of vision is adjusted to various distances have been thoroughly established by the investigations of Sanson, Langenbeck, Cramer, and Helmholtz, and are adopted by R. Brudenell Carter, one of the latest authorities on eye-sight. Professor Helmholtz has contrived an instrument for observing and measuring the various curvatures of the crystalline lens, which is turned to practical account in producing optical compensations for defective sight. This perfected knowledge of the structure of the eye has in fact had an important effect upon the treatment of defective vision. The crystalline lens is constructed out of a series of flattened fibers of albuminous substance, grouped in symmetrical loops around six separate axes, and connected together at their edges by interlocking teeth. The transparent mass is soft and pliable in youth, but it gradually grows denser with advancing years. This interferes with the facility with which it can be adapted to near vision, and is the cause of failing eye-sight. In early life the lens can be curved easily so as to bring objects not more than four and a half inches from the eye clearly into view, but at the age of forty it can not form a clear picture of objects nearer than nine inches. At fifty the point of nearest sight is removed to thirteen inches, at sixty to twenty-six inches, and usually at seventy all power of accommodation is practically gone. The lens retains the uniform contour adapted to distant objects, while it transmits the light with a somewhat impaired degree of perfection. The remedy for this is to supply the needed power of refraction by artificial lenses placed before the eye. By this means the power of clear vision for a certain fixed but convenient minimum of distance is completely restored. The artificial lenses should vary in convexity according to the needs of the eye. Mr. Brudenell Carter dwells with considerable

emphasis in his recent work on "Eye-sight, Good and Bad," on the inexpediency of postponing the use of artificial aids when they are needed. The failing of sight for near objects is the result of a loss of adjustability in the crystalline lens which can never be regained, and the loss will be accelerated by overstraining the eye. Spectacles should be resorted to as soon as they are needed, and should be always carefully adjusted to the actual need. Mr. Carter says: "It can not be too generally understood that spectacles, instead of being a nuisance or an incumbrance, or an evidence of bad sight, are to the far-sighted a luxury beyond description, clearing outlines which were beginning to be shadowy, brightening colors which were beginning to fade, intensifying the light reflected from objects by permitting them to be brought closer to the eyes, and instantly restoring near vision to a point from which, for ten or a dozen years previously, it had been slowly and imperceptibly, but steadily, declining. This return to juvenility of sight is one of the most agreeable experiences of middle age; and the proper principle, therefore, is to recognize loss of near sight early, and to give optical help liberally, usually commencing with lenses of $+1.25$ or $+1.50$, so as to render the muscles of accommodation not only able to perform their tasks, but able to perform them easily. When, as will happen after a while in consequence of the steady decline of accommodation, yet more power is required, the glasses may be strengthened by from half a dioptic to a dioptic at a time, and the stronger glasses should at first be taken into use by artificial light; the original pair, as long as they are found sufficient for this purpose, being still worn in the day-time." Mr. Carter and Dr. Harlan both strongly recommend, whether for the failure of near vision or for near-sightedness, the use of spectacles in preference to eye-glasses, which are less perfectly adjusted before the eyes and less steadily held in place.

Short sight is a defect of vision which arises from no natural or progressive modification of the organism of the eye, but it is often aggravated and indeed produced by the bad conditions under which the eyes are used. The organic cause of myopia is a too great depth of the eyeball, which causes the sharp image of an object to be formed in front of the retina instead of directly upon it. Eyes that are subject to this defect have a very sharp vision for objects held quite close to them, but at a little distance the outlines become blurred and the details indistinct. The remedy is spectacles with concave glasses, which should be adopted promptly when the need is discovered, because by constant straining of the eye its defect will become aggravated, even if an actually diseased condition is not induced. The organic peculiarity which is the cause of near-sightedness is often inherited, and some children are myopic at birth, but in general it is only the tendency that is congenital. This may be held in check,

or it may be accelerated, and very often near-sightedness originates in later life. It is most prevalent where civilization is farthest advanced, is more common in old than in new communities, in cities than in the country, among brain-workers and cultivated people than among laborers and the illiterate. There is a general agreement among authorities that a great development or increase of it takes place during school-life, and the result is largely due to preventable causes. "There is no longer any room for doubt," says Mr. Brudenell Carter, "that badly-lighted and badly-fitted schools form a great machinery for the development of myopia, and it is probable that this machinery, where, as in Germany, it has for a long time been in unchecked operation, may have an important influence upon the form of the eyeball, which will be inherited by large numbers of the population." Dr. Harlan declares that "it has been positively established by careful and extensive statistics that short sight is more frequently, if not almost exclusively, developed during school-life." Dr. Colin, of Breslau, reported, as the result of an examination of 10,000 school-children, that 1,000 of them were near-sighted, and he found that the defect increased numerically as the pupil advanced through the different grades of the schools. He found 6.7 per cent of myopia in the elementary, 10.3 in the intermediate, 19.7 in the high schools, and 26.2 in the gymnasias. Similar investigations with like results have been made by Dr. Erismann, in Russia, and by Drs. Agnew, Loring, and Lundy, in the United States. Dr. Lundy, of Detroit, found an increase of near-sightedness in a twelve years' course at school from 0 at the beginning to 12 per cent in the highest grade, a progressive development of 1 per cent a year. Imperfect light, impure air, bad construction and arrangement of desks and seats, and badly-printed books, are among the causes assigned. Dr. Donders, of Utrecht, declares that "the foundation of near-sightedness is mainly laid in schools, where, by imperfect light, the pupils read bad print or write with pale ink." Another cause of injury to the eyes, as well as the general health, is the admission to schools, and too close confinement there, of children at a too early age.

There is a form of imperfect vision known as astigmatism, which is caused by a more or less irregular curvature of the front part of the eye. When it exists to any marked degree, vertical and horizontal lines can not be distinguished with equal clearness. It is in some measure corrected by the use of glasses with a cylindrical instead of a spherical curvature. A structural defect of the eye, in the treatment of which great progress has been made, is that known as cataract, in which the crystalline lens condenses and thickens until it becomes impermeable by light. It is now very effectually treated by the complete removal of the lens, the place of which is supplied by a

properly adjusted lens of glass in front of the eye. This, of course, is absolutely without the power of accommodation, and different glasses have to be used for seeing at different distances. Professor Helmholtz adopts the conclusion that the perfection of the eye depends not upon the excellence of its construction as an optical instrument, but upon the manner in which it is used. The chromatic aberration of its humors, the astigmatism of its irregular contours, the blind-gaps of its nerve-screen, the imperfect transparency of its refractive media, the interposition of blood-vessels in front of the retinal membrane, the narrow limitation of the area of sharp definition, and the prevalent blurring of the lateral parts of the field, are all conditions that must be classed as optical imperfections. Yet every one of these imperfections is so counteracted and neutralized in the use of the organ under the plan of the employment of two eyes, and under the expedient of the rapid transference of the attention to different parts of the image, that it is actually unrecognized as a defect, and undiscovered until the most refined powers of scientific investigation have been brought to bear for its detection.

There are many injuries to which the eye is subject, and many conditions having an important bearing on the preservation of good eyesight, besides those mentioned in connection with structural or induced defects of form. It is Mr. Carter's belief that a very large proportion of what is generally regarded as congenital blindness is really caused after birth by ignorant or careless treatment. He puts the proportion as high as ninety-nine cases in one hundred. The eyes of new-born infants are doubtless extremely sensitive to the effects of light and temperature, and are imperfectly shielded by nature. "From the imperfect development of the bones of the infant skull," says Mr. Carter, "the eyes are placed, so to speak, on the surface, instead of being in hollows; the eyebrows and eyelashes are short, thin, and pale; the eyelids are almost transparent, and the irides are imperfectly furnished

with opaque pigment. In the first weeks of life, moreover, infants are unable to shelter themselves from dazzling light by changing the position of the head." Protection from too strong light and from sudden or violent changes either of light or temperature, proper attention to cleanliness and ventilation, and the intelligent treatment of purulent ophthalmia when it shows itself, would in his opinion prevent a very large proportion of the cases of blindness generally believed to be congenital.

Artificial illumination is more trying to the eyes than daylight, but, when its use is necessary, the risk of injury may be reduced to a minimum. There is little choice between oil and gas-light of a similar illuminating power. Mr. Carter remarks, "The best illumination for all purposes of close work is that of a Silber Argand burner, it matters not whether for gas or oil, placed to the left front of the worker, a little above the level of the eyes, fitted with a shade to reflect light upon the table and to intercept it above, and with the addition of an alum screen when the heat is objectionable." When several lights are used, they should be grouped together, as all cross-lights are distressing to the eye. Mr. Carter recommends that the least exacting kind of work should be done in the evening or at night; and, for literary men, reading and study by day and writing at night is the best arrangement. Reading in cars or other moving conveyances, and the close use of the eyes by dim or unsteady light, are universally condemned. Smoke is injurious to the eyes and eyelids, but, aside from its external irritating effect, Mr. Carter does not agree with some older writers in the opinion that tobacco-smoking produces any material injury to the eyes or optic nerves. According to the same authority, colored glasses should not be used except under competent surgical advice. But where protection is desired for healthy eyes from the glare of a strong light, or from reflection on snow or water, pale cobalt-blue or neutral gray is to be preferred to green or very dark glasses.

F

FALKLAND ISLANDS. These islands form a group in the South Atlantic Ocean, about two hundred and fifty miles northeast of Tierra del Fuego. The number of islands is about two hundred, but only two of them are of any considerable size. Their whole superficies is reckoned at 5,000,000 acres. A few years ago penguins and sea-lions chiefly occupied their shores; but of late the English Government has encouraged emigration to them, and now numberless sheep fatten on their grass. These yield to their owners such an abundance of wool that it has become an article of exportation growing yearly in impor-

ance. No other English colony has relatively made such progress during the last ten years. The population has doubled and the production has quadrupled. According to the statements of the English colonial office, the imports, which in 1867 amounted to £20,590, had in 1878 increased to £35,040. The exports, amounting in 1867 to £15,460, had increased in 1878 to £55,470. The population in 1867 was 705, and in 1878 it had increased to 1,394. The value of the exports relatively to the number of the inhabitants is £40 to each; while in Australia it is £19 to each, and in the United States it is £4. The balance of trade in favor

of the colony is equivalent to £15 for each inhabitant.

FERTILIZERS. The system of agriculture which consists in removing crops without restoring the plant-food they take from the soil, and which Liebig aptly called *Raubbau* (robbery-culture), has already reduced the soil of our older States to the condition where it must be fertilized or abandoned; where not only the most careful tillage, and husbanding of the manurial resources of the farm, but also the importation of plant-food from outside, are requisite to the restoration of fertility. Guano, phosphates, potash salts, and the like, have become with us, as in Europe, indispensable to successful agriculture.

Every one of the Atlantic, and many of the Middle States, employ large quantities of commercial fertilizers. Their use is extending to the prairies of Indiana and Illinois; and even in Kansas experiments are being made with them on soil stated to be "worn out with long cropping." Single towns in Connecticut are said to expend \$20,000 per annum in artificial manures, and the State of Georgia imports annually some \$5,000,000 worth of plant-food, in the form of phosphates, guano, potash salts, and the like, to restore fertility to her soils.

The amounts of these materials sent out from the central markets in the spring of 1881 were so great as to make, in some places, a railroad blockade. The Commissioner of Immigration of Georgia says: "It is frequently stated that the immense increase of the cotton-crop since the war over that prior to 1860 is due to emancipation only. A most important factor in bringing this about has been the very general use of commercial fertilizers." The rapid improvement of Southern agriculture has been made practicable by various material agencies, of which this is one of the chief. Not freedom alone, but freedom and superphosphates, are giving us the "New South."

How important a factor of the agricultural progress of the country commercial fertilizers have become is illustrated by the following figures, partly official and partly general estimates, but doubtless reasonably correct:

The Commissioner of Agriculture of the State of Georgia reports that the number of tons of commercial fertilizers inspected in that State in 1881 was 152,464, from which the State received \$76,232 (a tax of fifty cents being levied upon each ton consumed in Georgia).

Dr. Dabney, Director of the Agricultural Experiment Station of North Carolina, reports, under date of December 15, 1881, that 50,000 tons were consumed in 1878, 60,000 tons in 1879, and 80,000 tons in 1880; and that "the sales this year (1881) will slightly exceed this last amount."

It is estimated that Virginia consumes over 40,000 tons; Pennsylvania, over 50,000 tons; New Jersey, over 20,000 tons; New York, over 35,000 tons; Ohio, over 15,000 tons; New England, over 50,000 tons; and the use

of fertilizers is rapidly increasing toward the Mississippi Valley, and through Michigan, Indiana, and Kentucky. The consumption in the Atlantic and Middle States is estimated at not less than 500,000 tons, or about \$20,000,000 worth. Thousands of farmers, therefore, must be using fertilizers successfully, else why this constantly increasing consumption?

The term commercial fertilizers properly applies "to those articles occurring as natural deposits, like guano and Chili saltpeter; or manipulated in some way, like dried blood and fish-serap; or regularly manufactured, like superphosphates and potash salts, which are powerful fertilizers, are expensive in comparison with farm manure, and are regularly quoted in our market reports."

The history of the trade in commercial fertilizers dates back not more than about forty years. The value of bone, fish, and even of superphosphate of lime, however, was recognized long ago in farm practice. "The first settlers in this country learned of the aborigines on the coast that a fish, planted in each hill of maize, greatly increased the crop; bones were used as manure in England, to some extent, early in this century, and superphosphate of lime was made and applied by Sir James Murray, in England, as early as 1817."

In 1840 the first cargo of Peruvian guano was shipped to Europe. This date may be said to mark the beginning of the use of commercial fertilizers in agriculture. In the same year appeared Liebig's "Chemistry, in its Applications to Physiology and Agriculture," which book, with his other contributions to the subject, made the beginning of that movement which has created a science of agriculture, and has enabled the art of agriculture to meet the demands of modern life.

It is a not uninteresting coincidence that two movements of such moment for agriculture, artificial supply of plant-food to soils and the rational application of science to their culture, should have received their first great impetus at the same time. The ingredients to which the efficacy of the more common commercial fertilizers is mainly due are three—nitrogen, phosphoric acid, and potash. Among the more important sources of these materials in the American markets may be mentioned:

Nitrogen (ammonia).—The chief sources of nitrogen are: nitrate of soda and sulphate of ammonia, which supply nitrogen without phosphoric acid or potash; the various forms of slaughter-house refuse, dried blood, azotin, tankings, etc., which contain nitrogen with some phosphoric acid; and fish-serap and Peruvian guano, which furnish both these ingredients in considerable quantities, the latter containing also some potash.

Phosphoric Acid.—The most important phosphatic materials are: bone-black, Canadian apatite, Navassa and South Carolina phosphates, and sundry "rock" or "washed" guanos, as Curaçoa and Orehilla, which supply

phosphoric acid with little or no nitrogen; and bone, bat-guano, and Peruvian guano, which contain considerable nitrogen with their phosphoric acid.

Potash.—The chief supply of potash in fertilizers is found in the German potash-salts, of which there are several grades, the most important being the sulphates, muriates, and kainite.

PRESENT SOURCES, CHARACTER, AND PROSPECTIVE SUPPLY OF COMMERCIAL FERTILIZERS.—A few facts concerning the mode of occurrence, character, and prospects of future supply of some of the more important commercial fertilizers may not be out of place. For a number of statements here given we are indebted to an article on "Commercial Fertilizers: Sources of Supply and History of the Trade," by Dr. E. H. Jenkins, in the Report of the Connecticut Board of Agriculture for 1881.

Nitrogenous Fertilizers: Nitrate of Soda.—In Northern Chili, formerly Southern Peru, in the province of Tarapacá, between the Andes and the ocean, is a vast arid plain of tableland, three thousand feet above sea-level, stretching north and south for eighty miles. The winds that blow steadily from the Andes make an absolutely dry climate. The soil is destitute of vegetation, and the territory is uninhabited. On this plain occur vast deposits of nitrate of soda. It lies in strata five hundred yards wide and seven or eight feet thick, and in hollows looking like dried-up lakes, whose sides are coated and bottoms covered with the nitrate underlying common salt. The origin of the deposits is undetermined. It is conjectured that the nitrogen first came from guano deposits on the shores of an inland salt lake or sea, that through atmospheric agency it was oxidized to nitric acid and then replaced chlorine in the salt of the lake, and on evaporation was left in its present shape. The crude nitrate of soda is purified at the coast by solution, separation from sand, and recrystallization, and shipped to Europe and the United States. "In 1820 the first cargo was sent to England, but was thrown overboard in harbor because the duty was so high that it would not pay to pass it through the custom-house. In 1830 a cargo came to the United States, but found no sale. In that year 18,700 tons were exported from Iquique; in 1840, 227,300 tons; in 1850, 511,800 tons; in 1860, 1,370,200 tons; in 1870, 2,743,400 tons. In 1872 the amount had risen to 4,000,000 tons, and in the following year the Peruvian Government took the matter into its own hands and decided to export only 4,500,000 tons annually, so as to keep the price constant. At present the region is in the hands of the Chilean Government, and is likely to remain there.

"Till now only one grade of nitrate of soda has appeared in our market, and that has never shown any fluctuation in composition, running from 94 to 96 per cent of pure nitrate of soda, with from $\frac{1}{2}$ to $1\frac{1}{2}$ per cent of salt, $2\frac{1}{2}$ per cent of water, and a very little insoluble matter."

Sulphate of Ammonia.—Another source of nitrogen is found in ammonia salts, particularly the sulphate of ammonia, which is now chiefly obtained as a by-product in the gas-manufacture. When of fair quality it should contain from 16.5 to 20 per cent of nitrogen, or from 77.7 to 94 per cent of the pure salt. Formerly our supply came mostly from England, but of late it is being manufactured largely in this country. It is stated that low-grade sulphate of ammonia, with only $7\frac{1}{2}$ to $8\frac{1}{2}$ per cent of nitrogen, is being imported here. Such ammonia salts are apt to contain sulphocyanide of ammonia, a substance rich in nitrogen but poisonous to plants.

Animal Refuse: Dried Blood, Meat-Scrap, etc.—Another very important source of nitrogen for fertilizers is the offal of slaughter-houses, which comes into the market under a variety of forms and names: as, dried blood, meat-scrap, azotin, ammonite, tankage, etc. In the smaller slaughter-houses, the old way of letting the offal run to waste still prevails, but in the large establishments of both the East and West, scarcely a pound of the solid matter of the animals is left unutilized.

The blood is drawn into tanks, the albumen is coagulated and separated, the remaining solid residue is dried by various methods, and sold as dried blood, with from 9 to 12 per cent of nitrogen. It is a cheap, efficient, and valuable source of this costly element. Tankage and meat-scrap are names applied to the refuse flesh and viscera, with often more or less bone, prepared by processes similar to those used for dried blood. They are rich in nitrogen, and contain considerable phosphoric acid also. Ammonite or azotin is prepared from beef and pork "cracklings," the refuse from tallow and lard melting, by extracting them with benzine.

Fish-Scrap—Fish-Guano.—One of the most important sources of nitrogen for fertilizers in this country is the refuse left after the extraction of oil from fish, especially the menhaden. The early settlers of Massachusetts and Virginia learned from the Indians to manure their corn with fish, and it has long been the practice of farmers on the Atlantic coast to spread menhaden on their land for a fertilizer. Since the menhaden began to be utilized for the extraction of oil, a cognate industry has been developed in the manufacture of a concentrated fertilizer from the residual "pomace" or "serap." The first successful attempt to manufacture a fertilizer from fish-scrap is credited to a Mr. Lewis, of New Haven, Connecticut, in 1849. The fish were steamed or boiled until disintegrated, pressed to remove the oil, and the press-cake dried and ground. This is essentially the process now employed, though more or less successful modifications have been devised, especially to secure more complete extraction of oil, which is a valuable commodity when separated, but detrimental in the fertilizer. The crude material is known as fish-serap. When dried and pulverized it is called fish-guano.

The present extent of this industry and the use made of fish-manures may be gathered from the fact that, in 1875, the nitrogen derived from fish-manures was equal to that contained in 30,000 tons of Peruvian guano. In 1880 there were 79 fish-factories on the Atlantic coast, employing 448 vessels and 3,200 men; 2,035,000 gallons of fish-oil were produced, and 45,000 tons of scrap. The various kinds of animal refuse, dried blood, tankings, fish-scrap, etc., are used chiefly for "ammoniating" superphosphates.

Peruvian Guano.—This wonderful material, whose use by millions of tons has done so much to restore fertility to the depleted soils of Europe and America, has been in the past the most important of the various commercial fertilizing materials. Peruvian guano, as is well known, consists mainly of the excrement of birds, which has been accumulating for centuries on the almost rainless coasts and adjacent islands of Peru and Chili. What makes the excrement of birds particularly valuable as a fertilizer is that the excretion of both kidney and intestines is mixed in the cloaca, and voided in a comparatively solid condition. What makes guano so far superior to any fresh manure of the kind is that the sole diet of these birds was fish, which are rich in phosphoric acid and nitrogen, and also that all the moisture was speedily taken out of the mass by the dry, hot winds continually passing over it. It is interesting to note that our lands are continually suffering a loss in nitrogen and other elements of plant-food which, through various channels, finds its way continually to the ocean and passes out of our reach; and that through the agency of these birds many million tons of these same elements have been recovered from the ocean, and stored up where of all places they would keep best for our use, long before we felt the loss and desired its replacement. The use of guano as a fertilizer dates back at least to the time of the Incas in the twelfth century. The old Peruvians had a proverb to this effect:

"Guano can work miracles,

Though it is not numbered with the saints."

Humboldt brought samples to Europe, the analyses of which were published in 1806. A more complete investigation was made by Liebig and Wöhler in 1837. In 1840 a ship-load was brought to England, and since then many million tons have been taken to Europe and to this country. Of late the supplies of Peruvian guano have been curtailed and unreliable, partly because of the exhaustion of some of the deposits, and partly because of the misgovernment and war in Peru. The future of the Peruvian guano supply it is impossible to forecast. The supply for the coming year is said to be assured, and it is the opinion of those in position to judge, that, with a stable and enlightened government, Peru may supply Europe and America with guano for years to come.

Phosphatic Guanos and Rock Phosphates.—Peruvian guano being little exposed to rain, has retained a large portion of its soluble constituents. Many of the bird deposits, however, are subject to more or less frequent rains, which either wash back into the ocean the freely soluble materials, or bring them into reaction with the coral limestone by which they are in part retained. As a rule, the nitrogen and potash are lost, while the phosphates are retained and become a valuable source of phosphoric acid, forming what are called the phosphatic guanos. In former years we received a great deal of this material from some small Pacific islands of coral formation under the name of American guano. In 1856 the United States assumed the protection of all the guano islands in the Pacific which lay within 10° of the equator north and south, and between longitude 150° and 180°. The islands chiefly worked were Baker's, Howland's, and Jarvis's. The guano was brown, pulverulent, and coarse-grained, and could be shoveled without picks. It contained from thirty to forty per cent of phosphoric acid, and by treatment with sulphuric acid made excellent superphosphates. For some time past, however, the whole product has been carried to Europe. Our main supply of this material comes now from the West Indies. Just at the mouth of the Gulf of Venezuela, in the Caribbean Sea, lie Great Curaçoa and Little Curaçoa Islands. For some years they have furnished large quantities of guano to Germany and the United States. The Little Curaçoa guano from which most of our supply comes is poorer in phosphoric acid than the other, averaging from twenty-five to twenty-eight per cent. Its mechanical condition, however, is better. Great Curaçoa guano goes largely to Germany. It is hard and rocky, but has from thirty-eight to forty-two per cent of phosphoric acid. Another phosphatic guano, which has been used to considerable extent in this country, is the Orchilla, which has a somewhat similar composition, though it is of rather inferior value and importance. Another rock phosphate from the West Indies, the Navassa, is now extensively used in this country as material for the superphosphate manufacture. The phosphatic deposits of Navassa Island were formed under water and thrown up by volcanic action. The phosphate is inferior to the phosphatic guano mentioned, especially because of a large content of iron and alumina, which causes superphosphates made from it to "revert" badly.

South Carolina Phosphates.—Dr. Jenkins, in the article already referred to, speaks of this as follows: "The South Carolina phosphate beds I believe are, and for some time will be, the chief source of raw material for our domestic superphosphate manufacture.

"For most of the facts given in this connection I am indebted to an interesting printed report by Professor C. U. Shepard, Jr., of

Charleston, who has had a more extensive experience in the matter than any one else, and to verbal information received from him. As to the real extent of the deposits which can be worked to advantage, we at present are not fully informed, for the industry is still in its infancy. The existence of vast beds of phosphorite was known before the war, but they were not worked till after its close. This material is found in many places on and near the sea-coast, but the larger part hitherto marketed has come from the region lying to the north and northwest of Charleston between the Cooper and Stono Rivers, and from the region at the head of St. Helena Sound on the Bull and Coosaw Rivers northeast of Beaufort.

"It is essentially a phosphate of lime soft enough to be got out with shovel and pick. The land deposits occur in a stratum from six to fifteen inches thick, though averaging not more than eight inches, and where worked do not lie more than six feet below the surface.

"There are also submarine deposits consisting both of loose material brought down by the current, and of fine regular strata. This is known in the market as 'river rock.'

"The rock is always washed, drained, and dried somewhat before shipment, and some firms dry their material thoroughly by piling it up under cover around tubes which are supplied with hot air. Hot-air dried cargoes at present make up more than half the total amount shipped.

"The extent of the industry is indicated by the following figures:

"There were shipped from Beaufort and Charleston the following amounts of crude phosphate: In 1875, 122,790 pounds; 1876, 132,626; 1877, 163,220; 1878, 210,323; 1879, 199,365; 1880, 190,763; 1881, 266,734."

Apatite.—Very large deposits of the mineral apatite have been opened in Canada, and are being utilized for the manufacture of superphosphate. It is said, however, that the bulk goes to England, the market rates being at present such as to make other materials, as South Carolina phosphates, cheaper for our home use. The apatite, however, makes an excellent fertilizer, and the supplies are, fortunately, very extensive.

Bone-Manures.—Of these, the most important are bone, raw, boiled, and steamed, bone-black, and bone-ash. Bone is offered to the farmer almost everywhere and in a great variety of forms, and is, perhaps, more widely used than any other concentrated manure. Raw bones contain from $3\frac{1}{2}$ to 4 per cent of nitrogen, and from 20 to 25 per cent of phosphoric acid. Steamed bone is generally a little poorer in nitrogen and richer in phosphoric acid, while bone which has passed through the glue-factories contains often but a small fraction of one per cent of nitrogen, and may run as high as 30 per cent of phosphoric acid. Bone-manures vary in mechanical condition as well as in composition. Very fine-ground bone

acts quickly, but coarsely ground bone, especially if greasy, is one of the slowest of fertilizers to decompose in the soil and furnish its material to the plant. Adulterations of bone with intent to defraud are not frequent. A great quantity of very coarse bone is used, but boiling and steaming, which remove the fat and make the bone friable and easily ground, is becoming very general, and the result is a great improvement in the quality of bone-manures. The spent bone-black from sugar-refineries furnishes a small but constant supply of material, not suited for direct application to land, but much prized as a basis for superphosphate because of its fineness and convenience for treatment with sulphuric acid. Even when genuine bone-black is out of the market, manufacturers bent on satisfying their customers continue to turn out this popular superphosphate by a judicious mixing of mineral superphosphates and lamp-black. Bone-ash from South America is occasionally found in the markets.

Potash and the German Potash Salts.—The question whence the potash for the depleted soils of the world was to come, was for years a serious one with chemists and agriculturists. Wood-ashes were a very limited and withal costly source, and did not supply enough for use in manufactures and other than agricultural arts. The extraction of potash from orthoclase feldspar and from sea-water, though feasible, was too costly. The solution of the difficulty was found a few years ago in the discovery of the potash deposits in the region of Stassfurt, in Germany. This accumulation of salts has come from the evaporation of sea-water in past geologic time. The process of evaporation, whose cost, when carried on by artificial means, would be so great, has been provided for by nature on an enormous scale, and we have the products in the deposits referred to. Commencing near there but a few years ago, the use of potash salts as fertilizers has already become almost universal in Germany, has extended largely into other parts of Europe, has reached to the impoverished fields of our own country, and even to the coffee-plantations of Brazil and Ceylon. The amount used has increased from a few hundred to many thousand tons per year. The Stassfurt fertilizers have excited an interest and reached an importance comparable with that to which Peruvian guano attained years ago. The results of a great deal of experimenting and experience indicate that the usefulness of these salts as fertilizers depends not only upon the character of the salts themselves, of which there are various grades, but also on the kind of soil, the mode of application, and the kind of crop. Properly used on soils deficient in potash, they are extremely beneficial and profitable. A singular fact in connection with the Stassfurt mines is that the potash compounds were at first thrown away. The mines had been opened for the sake of the salt, of which they supply immense quantities. On the layer

of salt there rested enormous beds of saline compounds known to contain a great deal of magnesia and some potash. To get at the salt below, these magnesia and potash salts had to be dug out and dumped on waste land at the mouth of the mine. In 1860 the chemist Rose called attention to the waste, and the government encouraged fertilizing experiments with a view of utilizing this material, and also offered premiums to manufacturers who should devise methods of producing high-grade potash salts from them. In both directions there was complete success. The extent to which the industry has grown may be illustrated by a few figures. The amount of high-grade salts produced has been, according to the best data at hand, in 1862 about 3,000 tons; in 1863, 9,000 tons; 1864, 21,500; 1865, 14,700; 1866, 26,782; 1867, 25,991, while from this time the production increased until in 1877 it

reached 106,809 tons. Besides these high-grade materials, very large quantities of inferior grades are sold. The bulk of the potash salts in our markets belong to three classes—Sulphates, Muriates, and Kainite. The sulphates are difficult of preparation, costly, and sometimes contain less sulphate of potash than represented. The muriates are rarely below grade, and are for general uses the cheapest and most desirable. The kainite is a low-grade salt containing a small percentage of potash, and a large amount of common salt and magnesium compounds.

A most useful and satisfactory exhibit of the composition of the commercial fertilizers in our markets is given in a tabular statement, compiled from the most reliable analyses, by Dr. Jenkins, in "The Farmer's Annual Hand-Book for 1882,"* from which we condense the following:

The Composition of Various Sorts of Commercial Fertilizers, Farm Manures, and other Fertilizing Materials.

COMMERCIAL FERTILIZERS.															
	Number of analyses.	Water.	Organic matter.	Ash.	Nitrogen.	Silica and insoluble.	Alumina and oxide of iron.	Lime.	Magnesia.	Potash.	Soda.	Sulphuric acid.	Phosphoric acid.	Chlorine.	Carbonic acid.

"The average trade-values, or cost in the markets, per pound, of nitrogen, phosphoric acid, and potash," for 1881, are given by the Connecticut Agricultural-Experiment Station as follows. The figures are based upon prices in Connecticut and New York, but do not differ materially from those in other large markets:

TRADE-VALUES FOR 1881.		Cents per pound.
Nitrogen in nitrates.....	26	
" in ammonia salts.....	22½	
" in Peruvian guano, fine steamed bone, dried and fine ground blood, meat, and fish, superphosphates, and special manures.....	20	
" in coarse or moist blood, meat, or tankage, in cotton-seed, linseed, and castor pomace.....	16	
" in fine ground bone, horn, and wool-dust.....	15	
" in fine medium bone.....	14	
" in medium bone.....	13	
" in coarse medium bone.....	12	
" in coarse bone, horn-shavings, hair, and fish-scrap.....	11	
Phosphoric acid, soluble in water.....	12½	
" "reverted" and in Peruvian guano.....	9	
" "insoluble, in fine bone and fish guano.....	6	
" " "in fine medium bone.....	5½	
" " "in medium bone.....	5	
" " "in coarse medium bone.....	4½

EXPERIMENTS WITH FERTILIZERS.

Perhaps the most interesting phase of the late history of commercial fertilizers is the experimental study of their action upon the soil and influence upon the growth of plants. A large number of agricultural colleges, experiment stations, bureaus, societies, and private individuals have been lately engaged in this work, and results of great value are being attained.

Experiments in Georgia: Composts.—The Department of Agriculture of Georgia, under direction of J. T. Henderson, commissioner, has continued, during the season of 1881, the soil-tests of commercial fertilizers, which it has been conducting for some years past. In these experiments various brands of superphosphates, guanos, etc., alone and composted with cotton-seed or stable-manure, have been applied by planters throughout the State to parallel strips of land, on which various crops, especially cotton, were grown. The results are, on the whole, very encouraging for the use of high-grade fertilizers, though failures are not infrequent, even with favorable weather.

The very rational plan of composting concentrated fertilizers, such as acid phosphates with cotton-seed and farm manures, has brought most gratifying results. Thus one of the experimenters, Professor W. M. Browne,

of the State University at Athens, says: "My experience and observation, during the past five seasons, convince me that we can not afford to raise crops on upland without the aid of commercial fertilizers of established reputation, and of composts carefully made." Another experimenter, Mr. E. S. Wellons, of Perry, Houston County, says: "My experience, particularly on my own farm this season, more clearly than ever demonstrates the wisdom of composting acid phosphate with cotton-seed and stable-manure."

Experiments in Alabama: Fertilizers for Cotton.—Professor W. C. Stubbs, of the Agricultural and Mechanical College of Alabama, who has been conducting extensive series of experiments with fertilizers for cotton, arrives at a number of very interesting conclusions, of which several may be briefly stated, as follows:

1. The soils upon which the experiments were made, and which result from the decomposition of metamorphic rocks, principally hornblendic and feldspathic, appear to need no potash, little nitrogen, and a great deal of soluble phosphoric acid. Indeed, one great want which seems to prevail throughout the older cotton States (except, perhaps, in individual regions, such as the black cretaceous prairie cotton-belt of Alabama, which has not been tested) is soluble phosphoric acid. On worn-out soils a small quantity of nitrogen is also required—three parts of nitrogen to ten of phosphoric acid being a good mixture, as shown by experiments.

2. Phosphoric acid hastens, and nitrogen retards, the maturing of the plant.

3. Cotton-seed or cotton-seed meal is as efficacious as, and a far more economical source of nitrogen than, the much costlier guano, animal refuse, nitrate of soda, and other commercial materials. These conclusions are borne out by carefully conducted experiments as well as by large experience.

The doctrine that the Southern States will do better to utilize nitrogen in a home product than import it at an expense of millions of dollars every year is certainly an important one. Fortunately, it is getting to be understood and followed.

During the past five years several hundred field experiments with fertilizers have been conducted in concert in all the States east, and some west, of the Mississippi, and the provinces of Canada, by farmers, schools, and experiment stations. The results of a large num-

ber tabulated by Professor W. O. Atwater, by whom, as Director of the Connecticut Agricultural Experiment Station, the experiments were suggested, are of no inconsiderable interest.

Experiments for testing the Needs of Soils.—Of these experiments the larger number were performed by farmers as a means of learning what ingredients of plant-food were most needed by their soils and crops. The principle upon which they are based is briefly this: The chief office of fertilizers is to supply the plant-food that our crops need and soils fail to furnish. It is not good economy to pay high prices for materials which the soil may be made to yield in abundance or which may be supplied by the carefully husbanded manures of the farm, but it is good economy to supply the lacking ones in the cheapest way. The most important ingredients of our common commercial fertilizers are phosphoric acid, nitrogen, and potash, because of both their scarcity in the soil and their high cost. It is in furnishing these that guano, phosphates, bone-manures, potash salts, fertilizers for special crops, etc., are chiefly useful. The experiments provided the three ingredients named, each by itself, two by two, and all three together. Nitrogen was supplied in nitrate of soda, phosphoric acid in dissolved bone-black, and potash in the German muriate. Muriate of potash, at the rate of 150 pounds per acre, increased the yield of corn in some cases from scarcely enough to be worth husking to over sixty bushels of shelled corn with a rich growth of stalks, while in other places it was without marked effect, and alone it was not usually profitable. With superphosphate numerous experimenters compute their gain at \$20 to \$40 per acre, while others find large loss. With each of the other materials and mixtures the same is true to a greater or less degree. On the average the complete chemical fertilizer has brought larger, better, and surer crops than farm manures. The experiments show conclusively that:

1. Soils vary widely in their capacities for supplying crops with food, and consequently in their demand for fertilizers.

2. The right materials, in proper forms and in combinations suited to soil, crop, and surroundings, bring large profits.

3. The way, and the only way, to find what a soil wants is to study it by careful observation and experiments.

An outcome of these experiments has been the developing of a series of more complicated "special experiments," whose object is the study of certain important problems of fertilization and plant-growth.

The Feeding Capacities of Plants: the Nitrogen Supply.—A vast deal of experience in the laboratory and in the field bears concurrent testimony to the fact (though we are still deplorably in the dark as to how or why it is so) that different kinds of plants have different

capacities for making use of the stores of food that soil and air contain. Of the ingredients of plant-food commonly lacking in our soils, the most important, because the most rare and costly, is nitrogen. Leguminous crops, like clover, do somehow or other gather a good supply of nitrogen where cereals, such as wheat, barley, etc., would half starve for lack of it, and this in the face of the fact that leguminous plants contain a great deal of nitrogen and cereals relatively little. Hence a heavy nitrogenous manuring may be profitable for wheat and be in large part lost on clover. To get some more definite information as to the relation of our more common cultivated plants to the nitrogen supply, a "special nitrogen experiment" was devised, in which were compared the effects of mineral fertilizers (superphosphate and potash salt) alone and the same with nitrogen in different amounts and forms. The nitrogen was supplied as nitric acid in nitrate of soda, as ammonia in sulphate of ammonia, as organic nitrogen in dried blood, and the three forms combined.

Experiments with Corn.—The relation of corn to the nitrogen supply has been widely discussed. The main question is whether it is, like wheat, an "exhausting," or like clover, a renovating, crop. Botanically it is closely allied to wheat, and the most eminent authorities have attributed to it a similar relation as regards its demand for nitrogenous manures. Indeed, "corn manures" with large and very costly quantities of nitrogen have been widely recommended and largely used. So eminent an authority as Dr. Lawes, the famous English experimenter, recommends as "the best possible manure for cereals," including maize, "a mixture of nitrate of soda and superphosphate, while Professors Ville, of France, and Stockbridge, of the Massachusetts Agricultural College, whose formulas are widely known and used, have advised the following formulas for corn:

VILLE FORMULA FOR ONE ACRE.

MATERIALS.	Ingredients.	Cost in formula.	In cheapest form.
Nitrate of potash, 150 lbs.....	Nitrogen, 24 lbs. Phos. acid, 51 lbs. Potash, 79 lbs....	\$9 20	\$4 80
Acid phosphate of lime, 540 lbs.....		9 45	9 45
Sulphate of lime, 360 lbs.....		7 00	8 56
Total.....		1 44	1 44
		\$27 09	\$19 25

STOCKBRIDGE FORMULA FOR ONE ACRE.

MATERIALS.	Ingredients.	Cost in formula.	In cheapest form.
Sulphate of ammonia, 320 lbs.....	Nitrogen, 64 lbs..	\$15 20	\$12 80
Superphosphate, 245 lbs.....		4 84	4 84
Muriate of potash, 154 lbs.....	Potash, 77 lbs....	8 46	8 46
Total.....		\$23 00	\$20 60

Fortunately, we have a considerable number of experiments bearing upon this point. The results of the trials of 1881 have not yet been published in detail; the general outcome, however, is similar to that of those of previous years, which are summarized by Professor Atwater as follows. The "general" experiments are those of the former class (soil-tests), and the "special" of the latter class named above:

"Estimating a bushel of corn, with its cobs and stalks, to contain $1\frac{1}{2}$ pound of nitrogen, and to be worth 80 cents, the effects of the nitrogenous fertilizers in the special and in the general experiments may be summarized as follows, remembering that the superphosphate and potash salt, "mixed minerals," supplied the amounts of phosphoric acid and potash in a crop of not far from 55 or 60 bushels, which would also contain about the 72 pounds of nitrogen:

BUSHEL OF CORN AND POUNDS OF NITROGEN IN CROP, PER ACRE.

FERTILIZING MATERIALS.	Corn, bushels.	Nitrogen, pounds.
ELEVEN SPECIAL EXPERIMENTS.		
"Mixed minerals" alone.....	45.2	60.4
Same + 24 lbs. nitrogen.....	54.5	72.7
Same + 43 lbs. nitrogen.....	55.4	73.3
Same + 72 lbs. nitrogen.....	56.7	75.6
SEVENTY-FIVE GENERAL EXPERIMENTS.		
"Mixed minerals" alone.....	49.4	57.9
Same + 24 lbs. nitrogen.....	47.9	63.7

"In the general experiments the mixture of 300 pounds superphosphate and 200 pounds muriate of potash brought, on the average of fifty-three experiments, about $43\frac{1}{2}$ bushels of shelled corn per acre. The special experiments, however, seem to me a fairer test of what the fertilizers may do, because, while made in all sorts of weather and on worn-out soils, they were nearly all on soils and in latitudes fit for corn, as many of the general experiments were not. In these the mixture of 300 pounds superphosphate and 150 pounds of potash salt, which can be bought for \$8.25, brought on the average 45 bushels of shelled corn per acre.

"The experiments of these seasons bear unanimous testimony to two things: The corn was helped but little by nitrogen in the fertilizers; and it gathered a good deal from natural sources. The increase of crop and of nitrogen in the crop will appear more clearly if we look at it another way."

In number of trials.	WITH NITROGEN.		The average increase of corn was—	The increase of nitrogen in the crop was—
	Amount per acre.	Contained in crop of—		
75	24 lbs.	19 bushels.	4.1 bushels.	5.5 lbs.
53	43 "	36 "	6.2 "	7.9 "
22	72 "	54 "	8.0 "	10.6 "

Or, estimating the result in dollars and cents—

In trials, total number.	With nitrogen amounts.	Costing.	The nitrogen paid for itself in trials—	The nitrogen failed to pay for itself in trials—	The average loss in the several trials was—
75	24 lbs.	\$5 67 $\frac{1}{2}$	17	58	\$1 48
53	43 "	11 00	11	42	6 66
22	72 "	16 50	2	20	11 62

"The experiments are numerous and decisive enough to warrant the inference that, as corn is commonly grown, nitrogenous fertilizers in any considerable quantity would be rarely profitable. They imply that corn has somehow or other the power to gather a great deal of nitrogen from soil or air, or both; they imply that in this respect it comes closer to the legumes than the cereals—that, in short, corn may be classed with the renovating crops."

Practical Applications.—Among the general conclusions derived from these experiments are the following:

1. The "Complete Chemical Fertilizer," the mixture of 300 pounds superphosphate, 150 to 200 pounds potash salt, and 150 pounds nitrate of soda, costing \$15.38 per acre (including \$5 per acre for freight), brought the largest crops, exceeding even the farm manures with all the crops on which the number of experiments is large enough for a fair comparison, and bringing surer returns even in cold, wet, and drought. Doubtless a mixture with less potash and more phosphoric acid would have proved still more efficient.

2. The mixture of 300 pounds of superphosphate and 150 pounds of salt, costing \$8.25 per acre, brought a trifle less corn and decidedly more potatoes than farm manures.

3. The mixture of nitrate of soda and superphosphate, which corresponds closest of all to the ordinary ammoniated superphosphates, fish-manures, and guano, though costing more than the mixture of superphosphate and potash salt, brought less increase of corn, potatoes, turnips, sweet-potatoes, and indeed of every crop but oats. The number of experiments with oats, however, is too small for any general conclusions. It is very probable that oats and the cereals generally would be more helped by nitrogen, and less by potash, than the other crops. But it is a question whether manufacturers of ammoniated phosphates would not do better to substitute potash salts for the nitrogenous materials in compounding their fertilizers, at least for some crops.

4. The mixture of nitrate of soda and potash salt was the least useful in all the cases where it was tried.

5. As to the efficiency of the materials separately, the nitrate of soda was rarely profitable, the sulphate of lime frequently, the muriate of potash very often, and the superphosphate generally so. Doubtless, considerable of the effect of the superphosphate was due, in many cases, to the sulphuric acid and lime.

6. As to the effect of ashes, the results are variable, though generally they were efficacious.

7. Not only did the "Complete Chemical Fertilizer" bring a larger average increase than farm manures as actually used, and the mixture of superphosphate and potash salt nearly as large average increase, but the quality of the crop was generally better with the chemicals than with the farm manures. Potatoes, especially, were finer in quality and less disposed to rot with the artificial fertilizers than with the farm manures.

8. The most profitable material in a given case is that which is best fitted to its needs. The chief factors of the problem are: 1. Soil; 2. Season; 3. Feeding-capacity of the crop, its power to gather its food from soil and air; 4. Form of combination of the ingredients of the fertilizers; 5. The indirect action of the fertilizer.

Soils vary in respect to the plant-food they supply

in available forms. Phosphoric acid is most often insufficient; next come potash and nitrogen; then, lime and sulphuric acid, and rarely magnesia.

But the infertility of soils is due to physical causes perhaps nearly as often as to chemical. Soils often do not have the proper texture, they are too compact or too loose, or they lack absorptive power, they can not retain the plant-food until plants use it, but suffer it to be leached away by drainage-water; or the moisture-supply is bad—they are too wet or too dry. These defects are as bad as lack of plant-food. Many soils need first amendment and then manure. Drainage, irrigation, tillage, use of lime or muck, are often the cheapest if not the only means for bringing up poor soils. *Season* counts for much, often for everything, in the action of manure.

9. As to the *feeding capacities of the crops*, the experiments imply that the corn was somehow able to gather nitrogen from natural sources, provided it had enough of the mineral ingredients at its disposal. They do not tell how much of the nitrogen came from the roots of the preceding crops, how much from other nitrogen compounds in the soil, and how much from the air. They imply that potatoes possess in far less degree than corn the power of gathering sufficient supply of either nitrogen or the other ingredients of its food from soil and air. They imply that turnips are generally unable to provide themselves with phosphoric acid from the soil, and are greatly helped by it in fertilizers, and that without its application they usually get but little good from other materials; that with it alone they can generally gather but a partial supply of the other materials of their food; and that for a full yield considerable quantities of all the soil ingredients of plant-food are needed close at hand and in available forms.

10. Leaving differences of soils out of account, and considering the average results of the experiments, the best fertilizer to produce large crops of *corn* among the materials used would probably be a mixture of some nitrogenous material with superphosphate or bone, or both, and muriate of potash. The most profitable mixture would probably consist of muriate of potash with either superphosphate or fine ground bone, or both.

11. For *potatoes*, which responded well to all the materials, probably a mixture containing nitrogen, phosphoric acid, and potash. For either corn or potatoes, nitrate of soda, sulphate of ammonia, dried blood, or better, a mixture of these, could be advantageously used to supply the nitrogen, and superphosphate or bone-dust, or a mixture of the two, for phosphoric acid.

12. The common impression among farmers that the best use of artificial fertilizers is to supplement farm manure is doubtless, in ordinary circumstances, correct. The right way is to make the most and best manure that is practicable upon the farm, and piece out with such commercial fertilizers as experiments and experience prove profitable.

FIELDS, JAMES THOMAS, born December 31, 1817, in Portsmouth, New Hampshire; died April 26, 1881, in Boston. At the age of four years he lost his father, who was a ship-master. His education was acquired in his native town, and when only thirteen years of age he graduated at the high-school, having taken several prizes for Greek and Latin compositions. Before graduating he had attracted the attention of the late Chief-Justice Woodbury, who advised him to continue his studies and enter Harvard University; but this advice, for good reasons, was not followed, and in 1834 the lad went to Boston, where he obtained employment in the bookstore of Messrs. Carter & Hendee, this firm being succeeded by that of Allen & Ticknor, which in turn was succeeded by that of Ticknor & Fields in 1846, Mr. Fields

having become a partner in the house soon after reaching his majority. Meantime he had acquired an enviable social position, and at the age of eighteen had been invited to deliver the anniversary poem before the Mercantile Library Association of Boston—Edward Everett being the orator. "Commerce" was the subject of the poem. In 1847 he visited Europe, passed several months in England, Scotland, and Germany, and formed intimacies with some of the most distinguished literary people of the day; among whom were Talfourd, Dickens, Moore, Landor, and Wordsworth, at whose home he became a guest. With Dickens he formed a very close friendship, and it was through his influence that the famous novelist made his second visit to this country in 1867, at which time Dickens was the guest of Mr. Fields. While returning to America after his first tour, Mr. Fields narrowly escaped shipwreck on the coast of Newfoundland, the ship having struck the coast in a fog, sprung a leak, and was with difficulty kept afloat and taken into port. In 1848 Mr. Fields was again the poet at the anniversary celebration of the Mercantile Library Association, and on this occasion Daniel Webster was the orator. The subject chosen by Mr. Fields was "The Post of Honor." Before the same association he delivered a lecture upon "Preparations for Travel," which was full of sensible advice, well seasoned with humor. Often called upon to deliver poems and lectures, Mr. Fields appeared as a poet or lecturer before the societies of Harvard University, and Dartmouth and other colleges. A volume of his poetical compositions was published in Boston in 1843, and in 1858 he privately printed a beautiful volume, entitled "A Few Verses for a Few Friends," of which the "North American Review" made the following comment:

This book itself, apart from its contents, is a poem. In paper, type, edging, and ornament—in all the variable details of mechanical execution—it vindicates its title to be termed a work of high art. The poems it contains are gems well worthy the setting—pure thought, genial feeling, tender remembrance, and lambent fancy in natural measures and easy rhythm—such poems as always win a higher fame than they seek, and are best appreciated by those whose verdict is of the most significant import.

A second visit was made to Europe in 1851, and Mr. Fields was in Paris in December of 1851, when the *coup d'état* of Louis Napoleon took place. He witnessed the encounter between the troops and the populace upon the boulevards, and at the same time a house near him was shattered by a cannon-ball. During this trip he spent a winter in Italy—chiefly in Rome—and while in England passed three months in London, where he was the honored guest in cultivated circles, and invited to membership in the leading clubs. Literary people paid him great attention, and rendered his visit profitable as well as pleasant. A visit to Edinburgh gave him the opportunity for enjoying an intimate acquaintance with Professor Wil-

son and Thomas De Quincey. The latter welcomed him to his house, and accompanied him on several excursions in Scotland. One day they walked fourteen miles together on a visit to Roslin Castle, De Quincey beguiling the time, and cheating the miles of their weariness, with anecdotes of earlier days, when Coleridge, Southey, and Charles Lamb were his companions among the Westmoreland hills. In 1858 Mr. Fields collected, edited, and published the first complete edition of De Quincey's works, in twenty volumes. While contributing the productions of his busy brain to the literature of his time, and enjoying the pleasures of travel, Mr. Fields was energetically assisting in the business to which he had devoted himself in boyhood, and the firm of which he was a member held a leading position in the book-trade of America. From the time Mr. Fields entered it until his retirement from business on January 1, 1871, the firm, under its several changes of name, advanced steadily with the times, and for years the books bearing its imprint have been noted for their sterling character and for the beauty of their mechanical execution. To-day two of the most prominent publishing firms in the world represent the firm of Fields, Osgood & Co., which was dissolved on the retirement of Mr. Fields—Houghton, Mifflin & Co. being the direct successors, while the firm of James R. Osgood & Co. is an offshoot. During the later portion of his career, Mr. Fields edited the "Atlantic Monthly," which was established in November, 1857, by Messrs. Phillips & Sampson, with Professor James Russell Lowell as editor. In January, 1860, this magazine passed into the hands of Ticknor & Fields, and largely owes its success in the world of periodical literature to the labors of the distinguished poet and publisher.

After withdrawing from active business, Mr. Fields occupied his leisure with such literary pursuits as were most congenial to him. In 1858 he received the honorary degree of A. M. from Harvard University, and in 1867 that of LL. D. from Dartmouth College, and to the last his private life comported well with his public honors. Those saw him best who met him in his own home, environed by the books, the pictures, and the personal mementos dear to his heart. His large, strengthful frame, genial face, and massive head, covered with dark hair tinged with gray, appeared to their highest advantage in the spacious library where most of his time was spent, and from whose windows a fine view of the Charles River was presented. Here the grave discourse of the scholar was brightened by the sparkling wit and varied narrative of the traveled man of the world; nor did the silent presence of the ten thousand or more volumes that composed his library check the generous outflow of sympathy which is inseparable from opulent natures. In a small study adjoining his library Mr. Fields did most of his writing. Two tiers of book-shelves, forming an alcove by his desk,

held the books which he most frequently consulted; the walls were adorned with portraits and the choicest of his literary memorials and autographs—autograph copies of Tennyson's "Bugle-Song," and Mrs. Hemans's "The Breaking Waves dashed high," among them. Admittance to this room, and the sight of its treasures, were things to be remembered. In the fourth story of this house is a room known as "the Author's Chamber," which has been occupied by Hawthorne and Whittier, by Dickens, MacDonald, Thackeray, Kingsley, and many other distinguished men of letters. Adjoining it is a study well filled with books, and with furniture that is old and quaint. Mr. Fields's summer-house was on Thunderbolt Hill, at Manchester-by-the-sea, with charming outlooks, land and seaward. Mrs. Fields, the author of "Under the Olives," had christened it Gambrel Cottage, and Mr. William Black, in his novel, "Green Pastures and Piecadilly," describes the view from its verandas. Mr. Fields contributed to the leading periodicals of the day, and his writings are distinguished for a clear and finished style and for their accuracy. His "Yesterdays with Authors" is a volume made up of a series of sketches first published in the "Atlantic Monthly," under the title of "The Whispering Gallery," and afterward considerably enlarged. It contains papers of anecdote, reminiscences, and criticisms relating to Thackeray, Hawthorne, Dickens, Wordsworth, Miss Milford, and Barry Cornwall and some of his Friends." Several of these were afterward published as separate volumes in the "Vest-Pocket Series." "Underbrush" is a small volume in the "Little Classic" form, containing a number of essays on literary and social topics, among them one entitled "My Friend's Library," in which is given a pleasant account of some of his own literary treasures.

"The Family Library of British Poetry" is a stout volume of a thousand pages, containing selections from the best British poets from Chaucer to Tennyson, and edited by Mr. Fields and Mr. Whipple conjointly. Under such editorship the book could not fail to be a most valuable one. A companion volume, devoted to British prose, was projected by Mr. Fields. "Ballads and other Verses" is made up in part of poems that had been previously privately published, and in part of fresh material; these poems vary from grave to gay, and were accorded a very warm welcome. Some of Mr. Fields's most valuable literary labor was expended on lectures delivered before large and appreciative audiences in various parts of the country. Of these, the lectures upon "Charles Lamb and his Friends"; "Sydney Smith and his Work in Life"; "Christopher North, with Personal Recollections"; "Alfred Tennyson, the Man and the Poet"; "Fiction and its Eminent Authors"; "Literary and Artistic Society in London"; "Wordsworth, De Quincey, Keats, and Shelley"; "Longfellow, Campbell, and Hood"; "Cowper"; "Hawthorne";

"Rufus Choate"; "A Plea for Cheerfulness," etc., were enriched with reminiscence, and enlivened by humor that rendered them everywhere popular. Mr. Fields never abandoned his pen-work, and the latest issue of "The Congregationalist," dated April 26, 1881, has an article, "Letters from an Old Treasure-Box," in which he writes of Bayard Taylor, and gives some interesting letters which he received from him in 1846-'54.

So active and useful a man must be a serious and much-lamented loss to any community. During a period covering half a century, Mr. Fields was identified with the interests of Boston, and filled a large sphere in its local life; his share in the development of its literary interests will fix his name high in the chronicles of its literary history. Nor will he be soon forgotten among the champions of philanthropy and religion, with whom he wrought as zealously as was possible, considering the various demands in other directions upon his time and energies.

FINANCES OF THE UNITED STATES.

Notwithstanding the moderate harvests in some portions of the country, there has been no apparent check during the year 1881 to the abundant prosperity which for several years the nation has enjoyed. In that portion of the great Northwest which geographers, a few years since, were pleased to distinguish as the Great American Desert, and which still later has been officially pronounced as an arid waste, immense sections of land, of surprising fertility, have been opened to settlers, and already the surplus grain of the country is mostly produced west of the Missouri River, thus adding to the growing wealth of the country the resources, as it were, of a new continent. To these newly developed regions have gone the surplus capital and labor of the East, for both of which remunerative employment has been found. The individual prosperity which has so generally prevailed, has been reflected in the financial experience of the Government. Without additional imposition of taxes the revenues of the country have been largely increased over those of last year, while by judicious and economical management the expenses have been somewhat reduced in the same period.

The receipts of the Government for the fiscal year ending June 30, 1881, have been as follows:

From customs.....	\$198,159,676 02
From Internal revenue.....	185,264,885 51
From taxes on circulation and deposits of national banks.....	8,116,115 72
From miscellaneous sources.....	19,242,115 82
Total.....	\$360,782,292 57

During the same period the expenditures were:

For interest on the public debt.....	\$82,508,741 13
For pensions.....	50,059,279 62
For military establishment.....	40,466,460 55
For naval establishment.....	15,686,671 66
For civil expenses.....	17,941,177 19
For foreign intercourse.....	1,093,954 92
For Indians.....	6,514,161 00
For miscellaneous.....	46,442,441 88
Total.....	\$260,712,887 59
Leaving a surplus of.....	100,069,404 98

Compared with the previous fiscal year, the receipts have increased as follows: In customs revenue, \$11,637,611.42; in internal revenue, \$11,255,011.59; in tax on circulation and deposits of national banks, \$1,101,144.28; in miscellaneous, \$5,359,133.81; making a total increase of revenue over previous year of \$29,352,901.10. The expenditures show a net decrease over previous year of \$6,930,070.19, the principal item of decrease being that of interest on the public debt, \$13,248,833.93.

Of the amount of surplus revenues for the year, \$14,637,023.93 remained in the Treasury at the close of the year. The remainder, \$85,432,381.05, was applied to the purchase or redemption of obligations of the United States, all of which were interest-bearing, except the comparatively small amount of \$109,001.08 of fractional notes.

This excess of revenue promises to continue.

For the quarter ending September 30, 1881, the receipts have amounted to \$108,181,043.09, against \$97,889,239.92 for the same period in 1880; and the expenditures to \$75,051,739.39, against \$77,018,531.78 for same period in 1880. The accounts have not been closed to a later date, but the indications strongly point to an annual surplus largely in excess of that of last year, unprecedented as that was in amount.

The condition of the Treasury, however, is shown by statements published at the close of each month. As compared with January 1, 1881, the condition of the public Treasury, at the beginning of the present calendar year, may be stated as follows:

Statement showing assets and liabilities of United States Treasury on the 1st day of January, 1881 and 1882:

ASSETS.	January 1, 1881.	January 1, 1882.
Gold coin.....	\$61,481,244 71	\$84,639,564 73
Gold bullion.....	95,260,851 06	87,077,602 65
Standard silver dollars.....	48,190,518 00	69,589,937 00
Fractional silver.....	24,769,057 82	25,963,641 43
Silver bullion.....	6,138,224 35	3,607,329 86
Gold certificates.....	130,500 00

It will be noticed that the amount of gold coin and bullion held by the Treasury has increased during the year about \$15,000,000; silver dollars \$21,000,000, and United States notes \$10,000,000. The increase of gold coin arose mainly from an order of the Treasury Department, under which gold coin was received from depositors in exchange for silver certificates, redeemable only in silver dollars. Such was the demand for certificates in exchange for gold, that on November 1st almost the entire amount of silver dollars held by the Treasury was represented by outstanding certificates, and in consequence the order was revoked, the law not permitting an issue of such certificates in excess of the coin held for their redemption. At that time there were of these certificates outstanding \$66,327,670, an increase in three months of about \$15,000,000. As these certificates are redeemable, as stated, only in silver dollars, which are worth in intrinsic value only about eighty-eight per cent of the gold coin received, there has been an apparent advantage to the department in these transactions of about twelve per cent on the amount issued, the Government having by these transactions transferred to private parties at par the ownership of the silver dollars. But the certificates are also receivable by the department in payment of all public dues, at the par of gold, the transactions of the country being conducted on a gold basis, and the certificates, as well as the coin they represent, consequently, for the present, circulate at a gold valuation, and will doubtless continue to do so as long as there are no more of them afloat than can be conveniently used in payment of public dues. The certificates are not legal tender in private transactions, and when there comes an excess of them beyond the amount needed in public payments the holders can have no redress but to accept in their stead the silver dollars which they represent, and which the Treasury is obliged to hold for their redemption. The dollars thus received are a legal tender for all purposes, and in time, if the coinage of them continues imperative, must furnish the basis of value for the circulation of the country, and that basis then will be in accordance with the intrinsic value of the coins, not with the fictitious value at which they now circulate. Were the coinage of silver dollars unrestricted, as in the case of gold coins, the circulation of the country would at once fall to the silver basis, as the holders of silver bullion could have the same converted into dollars worth for circulation as much as so many dollars in gold, though containing but eighty-eight per cent of value, while the holders of gold bullion would find more profit in selling the same for commercial or other purposes at market rates. But holders can not have silver bullion converted into a lawful equivalent in weight of silver dollars, for the Government purchases the silver bullion at the best rates obtainable, and manufactures the coins only on its own account, turn-

ing the profit into the public Treasury, getting for about \$88 in gold enough bullion to make 100 silver dollars of standard weight. Already, to November 1, 1881, there have been coined from silver bullion thus purchased more than 100,000,000 silver dollars, of which there remained in the Treasury, as before stated, about \$66,000,000, the remainder being in active circulation. Under existing law the coinage of these dollars must continue at a rate of not less than \$2,000,000 per month, and, as all further issues have recently returned to the Treasury, it would seem that the limit of circulation of these coins has practically been reached. Hereafter they must accumulate in the vaults of the Treasury, to be represented in circulation either by certificates issued thereon, thus steadily inflating the paper circulation of the country with certificates actually worth, as before stated, only the value of the coin they represent, or the dollars will remain in the Treasury to the exclusion of gold coin, and become the only currency with which payment of public dues can be met, or the redemption of United States notes be made. In either event there is but one result foreshadowed—the reduction of the currency of the country to the standard of the silver dollars, and the exclusion of gold coin from circulation. This cloud in the financial horizon has not arisen unexpectedly. Foreseeing it, Congress embodied, in the act of February 28, 1878, authorizing the coinage of the standard silver dollar, a provision directing the President of the United States to invite the Governments of the so-called Latin Union, and such other European nations as he might deem advisable, to join the United States in a conference to adopt a common ratio between gold and silver for the purpose of establishing internationally the use of bi-metallic money and securing fixity of relative value between those metals. The Latin Union referred to consisted of France, Belgium, Switzerland, and Italy. Under a treaty the Union had issued silver and gold coins from its respective mints at the ratio of $15\frac{1}{2}$ of silver to 1 of gold, but, on account of the great depreciation in the value of silver, it had been compelled to suspend such coinage, to avoid driving the gold coins from circulation. The invitation to join the United States in the proposed conference was accepted by the Union and by several other states, and the conference was held in Paris, in August, 1878. The delegates from the United States requested those invited to pronounce upon the two following propositions:

1. It is the opinion of this assembly that it is not to be desired that silver should be excluded from free coinage in Europe and the United States of America. On the contrary, the assembly believe that it is desirable that the unrestricted coinage of silver, and its use as money of unlimited legal tender, should be retained where they exist, and, as far as practicable, restored where they have ceased to exist.

2. The use of both gold and silver as unlimited legal-tender money may be safely adopted: first, by

equalizing them at a relation to be fixed by international agreement; and, secondly, by granting to each metal, at the relation fixed, equal terms of coinage, making no discrimination between them.

These propositions were discussed, but did not become the subject of a general vote. The English and French delegates prepared an answer to be made by the European to the American delegates, which was adopted, as follows:

The delegates of the European states, represented in the conference, desire to express their sincere thanks to the Government of the United States for having procured an international interchange of opinion upon a subject of so much importance as the monetary question.

Having maturely considered the proposals of the representatives of the United States, they recognize:

1. That it is necessary to maintain in the world the monetary functions of silver, as well as those of gold, but that the selection for use of one or the other of the two metals, or of both simultaneously, should be governed by the special position of each state or group of states.

2. That the question of the restriction of the coinage of silver should equally be left to the discretion of each state or group of states, according to the particular circumstances in which they may find themselves placed, and the more so in that the disturbance produced during the recent years in the silver market has variously affected the monetary situation of the several countries.

3. That the differences of opinion which have appeared, and the fact that even some of the states which have the double standard, find it impossible to enter into a mutual engagement with regard to the free coinage of silver, exclude the discussion of the adoption of a common ratio between the two metals.

Notwithstanding that the proposition of the United States was declined with thanks, in which expression even some of the nations having a bi-metallic currency joined, though their interest in maintaining a fixity of value in the ratio between the two metals would seem at least to have been as great as that of the United States. Here, for some time, the matter rested, but the continued depression in the price of silver and a threatened stringency in monetary affairs, kept the subject under discussion, and in February, 1881, the Governments of France and the United States extended a joint invitation to the European nations to take part in a conference between the powers chiefly interested in the question of establishing the use of gold and silver as international money.*

The conference was to examine and adopt, for the purpose of submitting the same to the governments represented, a plan and a system for the establishment, by means of an international agreement, of the use of gold and silver as bi-metallic money, according to a settled relative value between these two metals.

The conference assembled in Paris, April 19, 1881, and delegates were present from Austro-Hungary, Belgium, Denmark, Greece, Italy, the Netherlands, Portugal, Russia, Sweden, Norway, Spain, Switzerland, United States of America, and from France. The delegates from Germany, Great Britain, British India, Canada, Denmark, Portugal, Russia, Greece, Austro-Hungary, Sweden, Norway, and Switz-

erland, respectively, announced at once important reservations on their part.

The delegates from Germany stated that between 1865 and 1870 a considerable quantity of gold found its way into the treasury of the German Empire, and that the Government took advantage of the occasion to firmly establish its monetary system upon the basis of a gold standard, and that this reform was now in a very advanced state; that almost 1,747,000,000 marks had been struck in gold coin, while 1,080,000,000 marks in silver coin of earlier mintage had been demonetized, the last of the operations amounting to 44,000,000 marks. They also stated that there still remained in Germany at most only 500,000,000 marks in silver thalers, and declared that this reform had sensibly bettered the condition of the monetary circulation in Germany; but, although they considered the monetary system of Germany as established upon solid foundations, still they had not failed to recognize the import of the fall of silver which had since occurred, and, to relieve the Latin Union from the apprehension that half a billion more of marks in old silver thalers would be thrown upon the market as silver bullion, Germany had, in May, 1879, resolved to suspend its sales of silver, and they had not since been resumed. The delegates, however, recognized without reserve that a rehabilitation of silver was to be desired, and, that it might be attained by the re-establishment of a free coinage of silver in a certain number of the most populous states represented at the conference of these states, to that end should adopt as a basis a fixed relation between the value of gold and that of silver. Nevertheless Germany, whose monetary reform was already so far advanced, and whose general monetary situation did not seem to call for a change of system so vast in scope, did not find herself in a position, so far as she was concerned, to concede the free coinage of silver. Still, having a disposition to assist the other powers which might unite for the purpose of a free coinage of silver at a fixed ratio with gold, Germany would agree for a period of some years to abstain from all sales of silver, and during another period of a certain duration would pledge itself to sell annually only a limited quantity, so small in amount that the general market would not be glutted thereby. It would also engage to eventually retire from circulation 27,750,000 five-mark gold-pieces, thus giving to silver a greater field for circulation at home; and it would, perhaps, melt down and recoin 172,000,000 old five- and two-mark silver-pieces at a ratio between the two metals of about 1 to 15½, whereas at present the ratio is 1 to 14.

This remarkable proposition, stripped of all technical verbiage, was as if Germany should say: "Gentlemen of the other powers, believing you to be in earnest in your proposition to establish a fixed relative value between gold

* See BI-METALLIC STANDARD, p. 60. At the hazard of some slight repetition, further proceedings of the Bi-Metallic Conference are here inserted and considered.—ED.

and silver, and that value to be as 1 to 15½, Germany offers her prayers for your success. She will not herself return to the free coinage of silver, but she will kindly hold 2,500 tons of old silver thalers, worth now about 77 per cent of their face value in gold, until, in accordance with your own theories, by your free coinage of silver, you will place so much of that metal into new channels of circulation, or into strong vaults, that its price will be enhanced, and a fixed relation of equal value between gold and silver will be secured, and when that time comes we will unload our silver upon you in exchange for your gold, at a profit of 23 per cent, and we are now prepared to discuss the details of the execution."

The delegates of Great Britain then followed, saying that for more than sixty years the monetary system of the United Kingdom had been on gold as a single standard; that this system had satisfied all the needs of the country, without giving rise to those disadvantages which had shown themselves elsewhere and under other monetary regulations. The Government of her Majesty could not therefore take part in a conference as supporting the principle of the double standard; but the representatives at London, of the United States, having declared that the powers represented at the conference reserved to themselves entire liberty of action after the discussion, the Government of her Majesty considered that it would be lacking in consideration toward friendly powers to persist in its refusal to send a delegate from the United Kingdom. Thus he had come, and he stood ready to furnish any information desired concerning the laws on the monetary system of England, but he was not permitted to vote upon any proposition which might be submitted to the conference. Subsequently he presented to the conference a communication from the Bank of England to the British Government, setting forth to what extent the bank could aid the proposed league of countries for the rehabilitation of silver. The communication was submitted on account of a declaration of the Italian Government of the conditions on which it would enter such a league, and was in these words:

The Bank Charter Act permits the issue of notes upon silver, but limits that issue to one fourth of the gold held by the bank in the issue department.

The purchase of gold bullion is obligatory and unlimited, the purchase of silver bullion is discretionary and limited, the distinction being enforced by the necessity of paying all notes in gold on demand.

The re-appearance of silver bullion as an asset in the issue department of the Bank of England would, as is understood by the Foreign-Office letter, depend entirely on the return of the mints of other countries to such rules as would insure the certainty of conversion of gold into silver, and silver into gold. The rules need not be identical with those formerly in force; the ratio between silver and gold, and the charge for mintage, may both or either of them be varied and yet leave unimpaired the facility of exchange, which would be indispensable to the resumption of silver purchases by a bank of issue whose responsibilities are contracted in gold.

Subject to these considerations, the Bank Court are satisfied that the issue of their notes against silver, within the letter of the act, would not involve the risk of infringing that principle of it which imposes a positive obligation on the bank to receive gold in exchange for notes, and to pay notes in gold on demand.

The Bank Court see no reason why an assurance should not be conveyed to the monetary conference at Paris, if their lordships think it desirable that the Bank of England, agreeably with the act of 1844, would be always open to the purchase of silver under the conditions above described.

The proposition of the Bank Court was a worthy rival to that of the delegates of Germany. In substance it proposed to accumulate silver in its vaults worth, in gold, considerably less than its face value, so long as other countries than Great Britain would "leave unimpaired the facility of exchange" by which it could at any time obtain gold therefor, par for par, at a handsome profit.

Notwithstanding the dispiriting responses of the two great powers, Germany and Great Britain, the conference proceeded to the discussion of the following *questionnaire* which had been prepared for it by a committee of its own body:

1. Have the diminution and the great oscillations which have taken place in the value of silver, chiefly within the last few years, been hurtful or not to commerce, and consequently to general prosperity?

Is it desirable that the relation of value between the two metals should possess a high degree of stability?

2. Should the phenomena referred to in the first part of the preceding question be attributed to increase in the production of silver, or to acts of legislation?

3. Is it or is it not probable that, if a large group of states should agree to the free and unlimited mintage of lawful coins of the two metals, with full legal-tender faculty at a uniform ratio between the gold and silver contained in the monetary unit of each metal, a stability in the relative value of these metals would be obtained, which, if not absolute, would at least be very substantial?

4. If so, what measures should be taken to reduce to a minimum the oscillations in the relative value of the two metals?

For instance:

1. Would it be desirable to impose upon privileged banks of issue the obligation to receive, at a fixed price, any gold and silver bullion which the public might offer?

2. How could the same advantage be secured to the public in countries where privileged banks of issue do not exist?

3. Should coinage be gratuitous, or, at least, uniform, for the two metals in all countries?

4. Should there be an understanding that international trade in the precious metals should be left free of all restraint?

5. In adopting bi-metallism what should be the ratio between the weight of pure gold and of pure silver contained in the monetary units?

On these propositions a long discussion ensued, eliciting much valuable information, but it seemed to be generally conceded that without the co-operation of the two great powers, which had been conspicuous in declining all propositions with a view of countenancing any purpose on their part of returning to a double standard, the convention must ultimately fail of its purpose. As indicating more definitely the purpose of France and the United States,

Mr. Evarts, in behalf of the delegates of those two countries, submitted, on the last day of the session, the following declaration:

The delegates of France and of the United States, in the name of their respective governments, make the following declarations:

1. The depreciation and great fluctuations in the value of silver relatively to gold, which of late years have shown themselves, and which continue to exist, have been, and are, injurious to commerce and to the general prosperity, and the establishment and maintenance of a fixed relation of value between silver and gold would produce most important benefits to the commerce of the world.

2. A convention, entered into by an important group of States, by which they should agree to open their mints to free and unlimited coinage of both silver and gold, at a fixed proportion of weight between the gold and silver contained in the monetary unit of each metal, and with full legal-tender faculty to the money thus issued, would cause and maintain a stability in the relative value of the two metals suitable to the interests and requirements of the commerce of the world.

3. Any ratio, now or of late in use by any commercial nation, if adopted by such important group of states, could be maintained; but the adoption of the ratio of 15½ to 1 would accomplish the principal object with less disturbance in the monetary systems to be affected by it than any other ratio.

4. Without considering the effect which might be produced toward the desired object by a lesser combination of states, a convention which should include England, France, Germany, and the United States, with the concurrence of other states, both in Europe and on the American Continent, which this combination would assure, would be adequate to produce and maintain throughout the commercial world the relation between the two metals that such convention should adopt.

After the conference had held but thirteen sessions, upon the suggestion of the two Governments of France and the United States at whose instance it was convened, it was adjourned to April 12, 1882. In submitting the proposition of adjournment, M. Denormandie, a delegate of France, said:

We can not disguise from ourselves that the observations just now submitted to you tend to nothing less than to establish, at least virtually, that nothing has been done here but an imperfect, useless, and empty work.

Had the proposition submitted by Mr. Evarts on behalf of France and the United States been accepted, even as a unanimous expression of the opinion of the conference, it is very doubtful if it would have received the sanction of the United States Government. The chief embarrassment under which the Government has labored in the coinage of silver since 1878, has been the lack of intrinsic value in silver; eighteen ounces being hardly equal in value to one ounce of gold, although by law sixteen ounces of it are declared to be equal to one of gold, and any proposition looking to further reducing this lawful equivalent would hardly be sustained. Should the proposition obtain, however, all our present silver dollars would be undervalued and would either be melted down for bullion or shipped from the country. There is not much reason to believe that the coinage of all the silver which could be used in

circulation in all the countries named would materially enhance its value, though perhaps it might check its depression, and the country would soon have a currency based upon silver whose dollar would be of even less value than the present one, leading to complications, not to say repudiation and dishonesty.

The question of the future coinage of the country is at best fraught with many serious difficulties, and there is but little hope that the further session of the convention as proposed can give us relief. Silver is not coined to-day by any European power without restrictions, and this country can not well give it unrestricted coinage here, without making our ports the dumping-grounds for all the silver of Europe now waiting for a market. On the other hand, an entire cessation of silver coinage by the United States, and a complete return to the single standard of gold, would likely be followed by like action in self-protection by all the European powers, thus for ever barring silver from circulation except as a subsidiary coin for making change, a result, it is believed, which would temporarily, at least, seriously disturb the monetary affairs of the world.

In any future discussion concerning the circulating medium of a country, the use of checks in making payments will doubtless be considered as an important factor. In this country especially has the use of checks for such purposes been extensively employed, reducing, to that extent, the necessity for money of any kind for circulating purposes.

In the London "Banker's Magazine" for November, Mr. Pownall estimates the percentages of receipts of coin, notes, and checks, in several European localities, as below, to which has been added those of New York city, as stated by the Comptroller of the Currency:

LOCALITIES.	Coin.	Notes.	Checks.
New York.....	·55	·65	98·60
London.....	·73	2·04	97·23
Edinburgh.....	·55	12·67	86·78
Dublin.....	1·57	8·53	89·90
Country banks in 261 places.....	15·20	11·94	72·86

Additional statistics published by the Comptroller of the Currency show that of \$52,118,185, received by 1,895 banks outside of the principal cities of the United States, 81·7 per cent was in checks. In the large cities the receipts in checks were over 90 per cent. Such an extensive use of checks in business must necessarily diminish largely the necessity of actual money for circulation.

It will be noticed that there were outstanding about \$5,000,000 of gold certificates. These certificates were issued upon deposits of gold, and are redeemable on presentation in that metal. Under a decision, or at least with the consent of the Treasury authorities, national banks have counted these certificates as part of their lawful reserve, though they are not legal tender, and are receivable by the Government only in payment of duties on im-

ports. The further issue of these certificates was suspended by an order of the late Secretary Sherman, in December, 1878, just before the resumption of specie payments, and, though considerable demand has existed for them, the order for their discontinuance has not been revoked. The objection to their issue seems to be that the banks, in such an event, would use them for a reserve, thus forcing the Government to store the coin for their redemption. The Government is required by law to issue silver certificates upon deposit of silver dollars, and to hold the deposit or its equivalent, and if the policy is objectionable in one case it certainly is in the other. There seems to be, however, some sentiment in favor of the Government's holding coin and issuing certificates thereon for circulation, and, while a paper currency thus issued is safe for the holders, such a line of policy is contrary to the long-established usages of the Government, and creates a central money power with which, perhaps, no European government would trust its executive officers.

In other ways the Government is also doing a business strikingly analogous to that of banking. To redeem the legal-tender notes of the United States, after January 1, 1879, upon their presentation at the office of the Assistant Treasurer, at New York, as required by the resumption act of 1875, the Treasury accumulated \$95,500,000 in gold coin by the sale of bonds, and held an additional amount, accruing from surplus revenues, to meet any probable demand for the redemption of the notes, of which there were outstanding \$346,000,000. The law fixed no limit on the fund which should be held for this purpose, but Mr. Sherman, who was Secretary of the Treasury when the act went into effect, decided that, after setting aside of the cash in the Treasury enough to meet in full the amounts due public disbursing officers, and the funds held by the Treasury in the nature of trusts, and an amount sufficient to meet all matured bonded debt and interest, there should be held about \$138,000,000 to meet the redemption of the outstanding notes, being about 40 per cent of their amount, and this policy has not been materially changed by his successors. It is argued that, as there is no probability that demand for payment of all the trust funds, matured bonds, and interest will be made at once, the reserve might be considerably reduced without detriment or danger. The legal-tender notes are asserted to be no more of a demand obligation than are matured bonds, and the other items against which a reserve of 100 per cent has been set aside. Reducing the reserve on the other demand obligations to 40 per cent of their amount, and the cash in the Treasury could be reduced nearly \$64,000,000, or, excluding the \$26,000,000 of fractional silver held by the Treasury and unavailable in making payments, about \$38,000,000. It is questionable, however, if any proposition to reduce the reserve

will find much favor in Congress. There is a strong feeling throughout the country that the policy of the Government in banking on its own credit is one to be restricted, not expanded, and that its entire extinction should be kept in view, that the Government may, as soon as practicable, be divorced from all financial operations not necessary to the conduct of its ordinary business.

During the year ending November 1, 1881, there was redeemed or purchased of 6 per cent bonds \$39,644,400; of 5 per cents, \$68,146,150; of 6s and 5s, continued at $3\frac{1}{2}$ per cent, as hereinafter explained, \$16,179,100—an aggregate of \$123,969,650, making an annual saving hereafter in interest of \$11,374,814.50. In addition to these transactions the Secretary of the Treasury reduced the annual interest to $3\frac{1}{2}$ per cent on \$178,055,150 of 6 per cents and \$401,504,900 of 5 per cents, without specific authority of law, the bill for refunding the bonds in question, which passed both Houses of Congress, having been vetoed by the President. As the vetoed bill contained provisions believed to be somewhat inimical to the national banks, the character of the legislation proposed becomes of importance as indicating the plan and strength of the attack likely soon to be made upon the existence of such banks as the time approaches for the renewal by Congress of their charters. Under the provisions of the original banking acts of February 25, 1863, and June 3, 1864, national banks were authorized to reduce their circulation and to withdraw their security bonds only upon surrendering their notes to the Comptroller of the Currency for cancellation, the amount of security bonds, however, not to be reduced to less than \$30,000, nor one third of the capital stock paid in. Any bank, however, going into liquidation for the purpose of winding up its business, could withdraw its security bonds upon depositing with the Treasurer of the United States legal-tender notes sufficient to redeem all its circulation. As the notes of the national banks circulated without restriction in all parts of the country, no sudden withdrawal of them from circulation, in the methods provided, was possible. Subsequently, under the provisions of the fourth section of the act of June 20, 1874, any national bank desiring to withdraw its circulating notes, in whole or in part, might, upon deposit of lawful money with the Treasurer of the United States in sums of not less than \$9,000, take up its security bonds, the amount of such bonds or deposit, however, not to be reduced below \$50,000.

Under the provisions of this section a bank could in a day lock up in the Treasury lawful money to a large proportion of its circulating notes. Thus a bank with \$250,000 in circulation could place in the Treasury \$210,000 in lawful money and withdraw all but \$50,000 of its security bonds, leaving to the Treasurer of the United States the duty of redeeming its notes to the extent of the deposit, whenever

such notes should come into his possession. There was nothing to prevent the bank from at once redepositing with the Treasurer of the United States the bonds withdrawn or any portion of them, or depositing other bonds and to receive therefrom from the Comptroller of the Currency new notes in proper proportion; and those transactions could be repeated indefinitely and in an amount to an extent limited only by the capacity of the officers mentioned to receive the bonds and to issue the new notes. No improper advantage, however, was taken by the banks generally of this privilege, and the provisions seemed in every way to be advantageous to the banking interests and not injurious to the Government. A few banks, however, did, from time to time, withdraw their security bonds, upon the deposit of lawful money, as provided, for the evident purpose of disposing of them and replacing them at lower rates upon a turn of the market in their favor. The Treasurer of the United States, in his annual report for 1880, called attention to these operations. In the few cases which had occurred, the Government suffered no special injury, but the transactions showed that a combination of banks might, under existing law, suddenly withdraw a large amount of money from circulation by depositing it in the Treasury on redemption account, thereby causing financial distress and a depression of prices, if not a serious panic. The opponents of the banks in Congress seized upon these reported transactions, which, even if much worse, could have been cured by a few lines of additional legislation, and ingrafted upon a bill for refunding the 5 and 6 per cents maturing in 1881, such additional, and, for refunding purposes, unnecessary legislation, that when the bill was finally perfected the important features of it were as follows:

That all existing provisions of law authorizing the refunding of the national debt shall apply to any bonds of the United States bearing a higher rate of interest than 4½ per cent per annum, which may hereafter become redeemable: *Provided*, That in lieu of the bonds authorized to be issued by the act of July 14, 1870, entitled "An act to authorize the refunding of the national debt," and the acts amendatory thereto; and the certificates authorized by the act of February 28, 1879, entitled "An act to authorize the issue of certificates of deposit in aid of the refunding of the public debt," the Secretary of the Treasury is hereby authorized to issue bonds to an amount not exceeding \$400,000,000, of denominations of \$50, or some multiple of that sum, which shall bear interest at the rate of three per cent per annum, payable semi-annually, redeemable at the pleasure of the United States after five years, and payable twenty years from the date of issue; and also Treasury notes to an amount not exceeding \$300,000,000, in denominations of \$10, or some multiple of that sum not exceeding \$1,000, either registered or coupon, bearing interest at a rate not exceeding three per cent per annum, payable semi-annually, redeemable at the pleasure of the United States after one year, and payable in ten years from the date of issue; and no Treasury note of a less denomination than \$100 shall be registered. The bonds and Treasury notes shall be, in all other respects, of like character, and subject to the same provisions as the bonds authorized to be issued by the

act of July 14, 1870, entitled "An act to authorize the refunding of the national debt," and acts amendatory thereto.

SECTION 4. That the Secretary of the Treasury is hereby authorized, if in his opinion it shall become necessary, to use temporarily not exceeding \$50,000,000 of the standard gold and silver coin in the Treasury in the redemption of the five and six per cent bonds of the United States authorized to be refunded by the provisions of this act, which shall from time to time be repaid and replaced out of the proceeds of the sale of the bonds or Treasury notes authorized by this act; and he may at any time apply the surplus money in the Treasury not otherwise appropriated, or so much thereof as he may consider proper, to the purchase or redemption of the United States bonds or Treasury notes authorized by this act: *Provided*, That the bonds and Treasury notes so purchased or redeemed shall constitute no part of the sinking fund, but shall be canceled.

SEC. 5. From and after the 1st day of July, 1881, the three per cent bonds authorized by the first section of this act shall be the only bonds receivable as security for national-bank circulation, or as security for the safe-keeping and prompt payment of the public money deposited with such banks; but when any such bonds deposited for the purposes aforesaid shall be designated for purchase or redemption by the Secretary of the Treasury, the banking association depositing the same shall have the right to substitute other issues of the bonds of the United States in lieu thereof: *Provided*, That no bond upon which interest has ceased shall be accepted, or shall be continued on deposit as security for circulation or for the safe-keeping of the public money; and in case bonds so deposited shall not be withdrawn, as provided by law, within thirty days after interest has ceased thereon, the banking association depositing the same shall be subject to the liabilities and proceedings on the part of the Comptroller provided for in section 5234 of the Revised Statutes of the United States: *And provided further*, That section 4 of the act of June 20, 1874, entitled "An act fixing the amount of United States notes, providing for a redistribution of the national-bank currency, and for other purposes," be and the same is hereby repealed; and sections 5159 and 5160 of the Revised Statutes of the United States be and the same are hereby re-enacted. . . .

In anticipation of the bill becoming a law, 141 of the banks, located in twenty-four different States, deposited lawful money in the amount of \$18,764,434 for the purpose of obtaining possession of their security bonds, the money to be used in redemption of their notes. Considerable stringency in the money market resulted from this action. The President, however, vetoed the bill, on account of the provisions of the fifth section, stating his reasons therefor as follows: "... Under this section it is obvious that no additional banks will hereafter be organized, except possibly in a few cities or localities where the prevailing rates of interest in ordinary business are extremely low." (For the remainder of President Hayes's veto, see CONGRESS, UNITED STATES, page 172.—ED.)

But against the enactment of such a law, other and perhaps more potent reasons existed.

Under the provisions of the section in question, the Government, in redeeming its matured obligations, would have been compelled to discriminate between holders. Thus to other than a national bank holding the ma-

tured bonds lawful money would be paid, but to such a bank the Government would offer in payment, instead of money, another of its obligations bearing a lower rate of interest, and the banks would be obliged to accept it or to go out of business.

The objection was forcibly stated by Senator Bayard, upon the adoption of the section in the Senate, as follows: "I would here note that section 5 of the House bill contains what I have spoken of as the compulsory power of the Government proposed to compel subscription to its loans." (For further remarks of Mr. Bayard, see CONGRESS, UNITED STATES, page 153, at bottom.—*En.*)

Mr. Bayard further spoke as follows: "I submit to the Senate that it is contrary and derogatory to the spirit of the American Government, which is a popular Government, professing to be based on the capacity of the people to govern themselves wisely, that the principle of compulsion for the reception of the loans of the Government should be forced upon any class of our people, or for any purpose. You tried it with your legal-tender Treasury notes, and declared that they should be receivable in payment of all debts, public and private. There are laws stronger than the laws of Congress. You may possibly drive men out of a business, but they will conduct it as long as they remain in it by the light of self-interest, and compulsion will ever prove futile. Its attempt is a proof of conscious weakness, and its failure will be inevitable and speedy."

This measure being vetoed at the closing hours of the session, Congress adjourned without further action with a view of refunding the maturing debt. The only financial legislation effected was embodied in a clause in the "Sundry Civil" Bill, authorizing the Secretary of the Treasury to apply surplus money in the Treasury, not otherwise appropriated, to the purchase or redemption of United States bonds. This clause became necessary, as the surplus revenues were likely to exceed the amount required for the purchase of bonds for the sinking fund, and beyond that the Secretary had no authority to apply any moneys in the Treasury to the reduction of the bonded debt. The adjournment of Congress left the incoming Administration with a maturing debt of about \$650,000,000, largely represented by coupon bonds, with no means for its redemption. To avoid the calling of an extra session of Congress, a scheme was prepared and successfully carried out by which the exigency was avoided, and a great saving of interest secured. This plan and the operations thereunder were fully set forth in a letter by Secretary Windom to the American Bankers' Association, dated August 8, 1881, as follows:

It may be stated, however, that when I entered upon the duties of my present position, in March last, I found that of the bonded indebtedness of the Government, there were of 5 per cent bonds, redeemable at

the option of the Government after May 1, 1881, the amount of \$469,320,650, of which the amount of \$146,101,900 was represented by coupon bonds; and of 6 per cent bonds redeemable at the option of the Government after July 1, 1881, the amount of \$202,266,550, of which \$45,391,000 were represented by coupon bonds.

Only the coupons for the quarterly interest falling due on May 1, 1881, remained upon the coupon 5 per cents, and none upon the coupon 6 per cents, the next semi-annual interest on which would fall due on July 1, 1881.

The refunding act, by which it was proposed to retire all these bonds, and to issue therefor bonds bearing a lower rate of interest, with several years to run before the Government had the option of payment, after having received much consideration by Congress during the last session, had failed to become a law; and the only resources of the Government to meet the maturing obligations were the surplus revenues, and the amount of \$104,652,200 4 per cent bonds, being a part of those authorized by the acts of July 14, 1870, and January 20, 1871, and remaining unissued.

These resources were not sufficient to provide for all the maturing bonds, and, owing to the length of time which such 4 per cent bonds had to run before maturity, it was not deemed advisable to issue more of the loan, if such issue could well be avoided.

While there was no imperative necessity for providing for the registered bonds of the maturing loans, some plan was needed to meet the interest payments on the coupon bonds, and there seemed to be no practicable method of meeting these payments without considerable expense to the Government, as well as to the holders of the bonds.

Finally, to meet the demands of public creditors, and at the same time to avoid the calling of an extra session of Congress, which seemed to be the only other alternative, the plan was matured which has been put into operation, and has proved successful.

Under this plan, on April 11th, there was called for absolute payment on July 1, 1881, the small loan of \$688,200, bearing six per cent interest, and known as the Oregon war debt, and at the same time, for payment on the same date, the six per cent loans, Acts of July 17th and August 3, 1861, amounting to \$140,544,650, and act of March 3, 1863, amounting to \$55,145,750; but to the holders of the bonds of the two latter loans permission was given to have their bonds continued at the pleasure of the Government, with interest at the rate of $3\frac{1}{2}$ per centum per annum, provided they should so request, and the bonds should be received by the Treasury for that purpose on or before the 10th day of May, 1881; and in case of coupon bonds, registered stock of the same loan should be issued therefor.

The six per cent bonds to be continued were promptly received in a large amount, and new registered ones issued therefor, with the fact of their continuance stamped upon their face; but it was subsequently deemed advisable to extend the time for the receipt of the old bonds to May 20, 1881.

It was also found that foreign holders of the six per cent bonds were inclined to dispose of their investments rather than to send them to the Treasury for exchange; and the immediate payment of so many bonds abroad being likely to cause a drain of coin from this country, and to disturb business, an agency for the exchange of the bonds in London was established.

This plan for continuing the sixes has proved entirely satisfactory, there having been presented in due time for continuance at $3\frac{1}{2}$ per cent interest, the amount of \$178,055,150, leaving to be paid off from the surplus revenues \$24,211,400, for which the Treasury had ample resources.

Having succeeded in disposing of the six per cents, on May 12th the department gave notice that the coupon five per cent bonds of the loan of July 14, 1870, and January 20, 1871, would be paid on August 12, 1881,

with a like privilege of continuing the bonds at 3½ per cent to such of the holders as might present them for that purpose on or before July 1, 1881; and at the same time the Treasury offered to receive, for continuance, in like manner, any of the uncalled registered bonds of that loan to an amount not exceeding \$250,000,000, the remainder of the loan being reserved with a view of its payment from the surplus revenues.

The continued three-and-a-half per cent bonds having a market price slightly above par, the five per cents in question were rapidly presented, and it became necessary to extend somewhat the limit fixed for the amount of registered bonds to be accepted for continuance.

On July 1st a notice for the payment on October 1, 1881, of the registered fives not continued was given, and the resources of the Treasury will be ample to meet their payment. . . .

By this plan the department has been not only relieved from the embarrassment of providing for the payment of the coupon interest, but has reduced all the six and five per cent loans of the Government to a loan payable at the option of the Government, and bearing interest at only 3½ per cent per annum; and this, with the trifling expense to the Government of preparing the new registered bonds, and of paying the actual expenses of the London agency, at which only three persons have been employed for a few weeks, issuing about \$44,500,000 of the continued bonds. . . .

It is important to notice that no calls were made for bonds in excess of the ability of the department to meet their payment had they been presented for redemption instead of continuance.

In addition to the six per cent bonds continued as above stated, there were also subsequently continued in like manner of five per cent bonds \$401,504,900, making an annual saving in interest thereafter through these transactions of \$10,473,952.25.

The entire expenses incurred therein were less than \$10,000, and the scheme can hardly be regarded as other than a remarkable financial achievement.

The following table shows the condition of

	Gold.	Silver.	Total.
Domestic production.....	\$35,815,036 55	\$28,477,059 21	\$64,292,095 76

Net debt.....	\$1,899,181,785 91	\$1,765,491,717 09

During the fiscal year ending June 30th the influx of gold from foreign countries continued, there being a net import of \$5,836,058 of American coin and \$91,715,012 of foreign coin and bullion, of which latter amount \$91,499,168.61 found its way to the New York assay-office. Meanwhile it is believed that the domestic production of that metal had not diminished to any considerable extent.

The deposits at the several mints and assay-offices for the year, of gold and silver, have been as follows:

mated by the Director of the Mint to be as follows:

STATE OR TERRITORY.	FISCAL YEAR 1880.			FISCAL YEAR 1881.		
	Gold.	Silver.	Total.	Gold.	Silver.	Total.

• Proof trade dollars, 1,987.

The number of national banks in the country appears to be increasing, eighty-six having been organized during the year ending November, 1881, with an aggregate authorized capital of \$9,651,050, and circulation of \$5,233,580—the largest number of banks organized in any one year since 1872. Meanwhile there were discontinued twenty-six banks, with a capital of \$2,020,000 and circulation of \$1,245,530, making the total number in operation October 1 last 2,132, the greatest number of banks that have ever been in operation at any one time. Since the organization of the national-bank system, three hundred and forty banks have gone into voluntary liquidation, and eighty-six have been placed in the hands of receivers to close up their affairs. It is estimated by the Comptroller of the Currency, from whose reports most of the information concerning national banks is necessarily obtained, that the losses to creditors from the failures of national banks during the eighteen years since the passage of the National Bank Act, has been about \$6,240,000, an annual average of about \$346,000. As these corporations have had an average capital of about \$450,000,000 and deposits averaging \$800,000,000, the percentage of loss on money employed is remarkably small.

The resources and liabilities of the national banks on October 1, 1881, are stated as follows:

RESOURCES.	
Loans and discounts.....	\$1,169,022,308
Over-drafts.....	4,773,750
Bonds for circulation.....	863,895,500
Bonds for deposits.....	15,540,000
United States bonds on hand.....	40,972,450
Other stocks and bonds.....	61,895,708
Due from reserve agents.....	182,965,133
Due from other national banks.....	75,595,446
Due from other banks and bankers.....	19,806,827
Real estate, furniture, and fixtures.....	47,329,111
Current expenses.....	6,731,936
Premiums.....	4,185,636

Brought forward.....	\$1,944,520,825
Checks and other cash items.....	14,581,879
Exchanges for clearing-house.....	189,222,256
Bills of other national banks.....	17,732,712
Fractional currency.....	378,946

United States deposits.....	5,474,690
Deposits of U. S. disbursing officers.....	3,631,503
Due to national banks.....	205,562,946
Due to other banks and bankers.....	59,047,471
Notes and bills rediscounted.....	8,091,165
Bills payable.....	4,664,077

Total.....\$2,858,887,391

Under the provisions of the National Bank Act of February 25, 1863, every national banking association organized thereunder was to have succession by the name designated in its articles of association and for the period limited therein, not, however, exceeding twenty years from the passage of the act. The act of June 3, 1864, provided that each association should have succession for a period of twenty years from its organization. Under these acts the corporate existence of the bank first organized expired on January 1, 1882, and that of the second will expire on April 11th following. From the last-named date to February 25, 1883, the corporate existence will terminate of 393 banks, having a capital of \$91,985,950 and a circulation \$67,855,910. The corporate existence of 1,080 banks organized under the act of June 3, 1864, will cease between 1884 and 1890, mainly in the first two years of that period. While further legislation is deemed desirable to authorize these banks to renew their charters, it does not appear to be necessary. The Comptroller says:

If, for any reason, the legislation herein proposed shall not be favorably considered by Congress, the banks can still, under the present laws, renew their existence if they so desire; and in the absence of prohibitory legislation many of them undoubtedly will, on the expiration of their present charters, organize new associations with nearly the same stockholders as before, and will then apply for and obtain from the Comptroller certificates authorizing them to continue business for twenty years from the respective dates of their new organization certificates. Such a course of procedure will be perfectly legal, and, indeed, under the existing laws, the Comptroller has no discretionary power in the matter, but must necessarily sanction the organization or reorganization of such associations as shall have conformed in all respects to the legal requirements.

The passage, however, of a general act directly authorizing an extension of the corporate existence of associations whose charters are about to expire would, in many instances, relieve the banks from embarrassment. As the law now stands, if the shareholders of an association are all agreed, the process of reorganization is simple; but if any of the shareholders object to such reorganization, they are entitled to a complete

liquidation of the bank's affairs, and to a *pro rata* distribution of all its assets, including its surplus fund. In many instances executors and administrators of estates held national-bank stock in trust; and while they might prefer to retain their interests in the associations which issued the stock, they would perhaps have no authority to subscribe for stock in the new organizations. While, therefore, the legislation asked for is not absolutely essential, yet its passage at an early day would be a great convenience to many of the national banks, and especially so to the class last referred to.

During the year 1879, on \$456,968,504 of capital, the national banks have paid in taxes to the United States \$7,016,131; to the several States, \$7,603,232—a total of \$14,619,363, or \$3.20 on each \$100 of capital. During the same period the banks declared dividends on their capital stock of 5.5 per cent, and in and for the year ending September 1, 1881, dividends of 9.2 per cent.

For the six months ending May 31, 1881, the State banks, savings-banks, and private bankers report a capital of \$24,502,719, deposits in the amount of \$96,360,426, on both of which a tax was paid of \$202,844.80, or at a rate per annum of only about 3.2 cents per hundred dollars on both capital and deposits. The earnings of these banks are of course not known.

On October 1, 1881, the national banks, excepting those in the reserve cities, held against deposits of \$507,247,143, a reserve of \$158,299,042, or 31.21 per cent, although the law required a reserve of only 15 per cent. In the reserve cities, exclusive of New York, against deposits of \$325,669,226, the banks held reserves amounting to \$109,805,507, or 30.03 per cent. In New York city the deposits were \$268,769,373, against which there was a reserve of only \$62,542,546, or 23.27 per cent. In these cities the law requires a reserve of 25 per cent of the amount of the deposits, and though, at the date mentioned, unusually heavy demands are made upon the banks for money to be used in payment for cotton, grain, and provisions, among the producers in the West and South, the banks kept their reserve largely in excess of the amount required by law, except in New York city, where it was temporarily reduced below the limit, but not enough to create any distrust in monetary circles.

During the last fiscal year the value of our foreign commerce has largely increased, both in exports and of merchandise and specie, the exports of merchandise reaching the unprecedented amount of \$902,377,346, an increase over that of the previous year of \$66,738,688, and considerably in excess of that of any previous year. The value of the imports of merchandise during the same period amounted to \$642,664,628.

The specie value of the exports of the country has increased within the last ten years about \$455,000,000, made up largely from the increase in certain products and manufactures, as will be seen by the following table, comparing the value of exports on those articles for 1871 and 1881:

COMMODITIES.	Value of exports during the year ended June 30—		Increase.
	1871.	1881.	
	Dollars.	Dollars.	Dollars.
Bread and breadstuffs.....	79,831,187	270,332,519	190,501,332
Provisions and tallow.....	41,870,254	158,398,896	116,458,642
Cotton and manufact. of.....	221,835,245	261,267,133	39,381,883
Animals, living.....	1,019,604	16,412,398	15,392,794
Leather and manufact. of.....	1,597,395	8,088,445	6,191,050
Wood and manufact. of.....	12,916,542	18,600,312	5,683,770
Total increase in the exports of the above articles.....			374,059,476

The following table will show the value of imports and exports of merchandise with each of the principal foreign countries and their dependencies, over the year ended June 30, 1881:

COUNTRIES.	Exports.		Imports.
	Dollars.	Dollars.	
United Kingdom (England, Scotland, and Ireland).....	481,135,078	174,493,738

Included in the amount of exports is an amount of \$18,451,399, foreign merchandise, which is exported after having been entered in this country, and retained in store for a longer or shorter period; the remainder, \$883,925,-947, is domestic merchandise.

FLORIDA. The vote of the State in the last presidential election was 51,618: for the Garfield electors, 23,654; for the Hancock electors, 27,964; majority for Hancock, 4,310. The Legislature, consisting of 22 Republicans and 85 Democrats in both branches, convened on the 4th of January and adjourned on the 4th of March. On the 18th of January Charles W. Jones was re-elected United States Senator. Among the laws enacted at this session are the following:

An act to prevent illegal voting in the State.

An act to suppress gaming.

An act to provide for the assessment and collection of taxes upon improvements on the public lands, and for the protection of occupying claimants of said lands.

An act to enable a married woman to dispose of her separate property by last will and testament.

An act to incorporate the Live Oak and Rowland's Bluff Railroad Company.

An act to prevent the selling as butter of oleomargarine, or any spurious preparation purporting to be butter.

An act relating to the arrest of fugitives from justice from other States.

An act to repeal and dissolve municipal corporations under certain circumstances, and to provide the manner in which such cities may become reincorporated.

An act for the better protection of passengers on railroad-cars, and the employes of railroad companies.

An act to make the public use of indecent or obscene language a misdemeanor, and provide for the punishment thereof.

An act relating to landlords' lien, for what, and upon what it exists.

An act to incorporate the Carrabelle and Thomasville Railroad Company.

An act relating to the intermarriage of white persons with persons of color.

An act for the benefit of sheep-raisers, and for the protection of sheep and other stock against dogs.

An act to encourage the planting of oysters in the waters of this State, and to protect the rights of owners thereof.

An act to prevent the selling, hiring, bartering, lending, or giving to minors under sixteen years of age, or to any person of unsound mind, certain fire-arms or other dangerous weapons.

An act to dissolve municipal corporations under circumstances therein stated, and to provide governments for the same.

An act to incorporate the Orange Ridge, DeLand and Atlantic Railroad Company.

An act to confirm the organization of the

Jacksonville, St. Augustine and Halifax River Railway Company, and to grant certain ferry privileges and lands to said company.

An act to amend sections 2, 3, and 4 of an act entitled "An act to incorporate the St. John's and Lake Eustis Railway Company," approved February 20, 1879.

An act to provide for calling out the organized and enrolled militia of this State to aid the civil authorities.

An act to incorporate a company, and to facilitate the construction and equipment of a railroad from Green Cove Springs, upon the St. John's River, in Clay County, to the town or village of Melrose, in Alachua County, under the style of the Green Cove Springs and Melrose Railroad Company.

An act to grant certain lands to the East Florida Railway Company.

An act to prohibit the sale of intoxicating liquors within two miles of any camp-ground used for religious worship in this State.

An act to prevent the improper living together of certain persons.

An act to reappportion the congressional districts of this State.

An act to amend the first section of chapter 3138, Laws of Florida, entitled "An act prescribing a uniform rate of fare upon railroads," approved March 11, 1879.

An act to designate the holidays to be observed in the acceptance and payment of bills of exchange, bank-checks, and promissory notes.

An act to incorporate the Pensacola and Atlantic Railroad Company, and to grant certain lands to the same.

An act to authorize the appointment of a committee to investigate the issue of the bonds of 1873, and the origin and disposition of the same.

An act to enlarge the equity jurisdiction of the circuit courts.

An act to encourage the construction of canals between the Matanzas and Halifax Rivers, and between the Mosquito and Indian Rivers, commonly known as the Haulover.

An act to enable settlers on State lands to obtain titles thereto.

An act to incorporate the Palatka and Indian River Railway Company.

An act to authorize the trustees of the Internal Improvement Fund of the State of Florida to protect the interest of the said fund by becoming a bidder and purchaser of the railroads from Lake City to Quincy, and the branch to Monticello, and from Tallahassee to St. Marks, should the same be sold, as provided in the seventh clause of the decree in the case of J. Fred Schutte and others, complainants, vs. the Jacksonville, Pensacola and Mobile Railroad Company and others, defendants, rendered in the Circuit Court of the United States, Fifth Judicial Circuit, Northern District of Florida, by the Hon. Joseph P. Bradley, Circuit Justice, and filed the 31st of May, 1879, and for other purposes.

An act to prevent the careless use of firearms on the public highways.

An act to prohibit the fishing for shad during certain periods of time herein specified.

An act to amend chapter 3147 of the acts of 1879, entitled "An act to protect the food-fishes of the State and to regulate fisheries," approved March 11, 1879.

An act to provide for the appointment of boards of health for incorporated cities and towns in this State containing 300 or more registered voters.

An act to incorporate the Tropical Peninsular Railroad Company.

An act to incorporate the Florida Midland and Georgia Railroad Company, and to grant certain lands to the same.

An act to incorporate the Blue Spring, Orange Ridge, and Atlantic Railroad Company.

An act to incorporate the Monticello and Georgia Railroad Company.

An act to incorporate the Okeehumkee and Panasofkee Railroad Company.

An act to incorporate the Atlantic and Gulf Coast Canal and Okechobee Land Company.

The following are the essential portions of the act for the dissolution of municipal corporations:

SECTION 1. That, whenever any city or town in this State incorporated under the act for the incorporation of cities and towns, approved the 4th day of February, A. D. 1869, is indebted to the amount of one hundred thousand dollars, the interest of which has remained unpaid for five years or longer, the charter of such city or town shall be and the same is hereby declared to be repealed, and the incorporation thereof dissolved, which dissolution shall take effect on the proclamation of the Governor of the State, to be made as hereinafter provided.

Sec. 3. . . . *Provided, however,* That the officers of such dissolved corporation shall continue to be the custodians of the books, records, papers, money, evidences of debt, and property of every nature and description, both real and personal, of such corporation, and shall continue to exercise the functions of their respective offices, so far as may be necessary to preserve the peace and good order of such city or town, until the establishment of another government and the appointment and qualification of officers under it, to whom it shall be the duty of the officers of such defunct corporation to transfer and deliver promptly, on demand, all books, records, papers, evidences of debt, money, and property of every nature and description, both real and personal.

Sec. 5. That at any time after the first publication of the Governor's proclamation, as provided for in section 3 of this act, on the petition of twenty or more persons residing within the limits of any city or town in this State, the charter of which has been repealed and the incorporation dissolved under this act, it shall be the duty of the Governor, with the advice and consent of the Senate, to appoint a mayor and five aldermen, residents of such city or town, who shall exercise the powers and functions hereinafter provided, and shall hold their office for two years, and until their successors are appointed and qualified.

Sec. 6. That all such cities and towns for which a mayor and aldermen shall be appointed, as provided for in section 5, are hereby declared to be provisional municipalities, the boundaries of which shall be co-extensive with the boundaries of such defunct cities and towns. And the said mayor and aldermen, and such officers as may be appointed by them, and the inhabitants within the limits of such cities and towns,

shall be vested with all the powers and authority, rights and privileges, and charged with all the duties which are conferred on the mayor and aldermen and other officers and the inhabitants, under and by virtue of the said act to provide for the incorporation of cities and towns, approved 4th February, A. D. 1869, chapter 1688, and the amendments thereto, except as hereinafter provided, and as may be inconsistent with this act.

Sec. 9. That the mayor and aldermen shall be authorized to compromise and settle the existing indebtedness of such defunct corporations upon the best terms obtainable, and which they may approve, having regard to the amount of such indebtedness and the means and the ability of the inhabitants and property-holders of such city or town, and for this purpose they are authorized to issue bonds bearing an annual interest of not more than four per cent for the first five years, and not more than six per cent for any subsequent period, the said bonds to mature in twenty-five years, which bonds shall be used for no other purpose than the settlement of said existing indebtedness.

Sec. 12. That, out of the amount of taxes now authorized by law to be assessed by the cities and towns, at least one half of one per cent shall be annually appropriated to the extinguishment of the said indebtedness and the interest on the same, or such substituted obligations as shall be given therefor.

Another law, with similar provisions, including substituted bonds at not more than seven per cent interest, enacted—

That the charters of all cities and towns incorporated or that shall hereafter be incorporated under any of the laws of this State, which have a bonded indebtedness, such bonds being past due and unpaid, and for which a fund for their payment has not been provided, shall be and the same are hereby declared to be repealed and dissolved, such dissolution to take effect on the proclamation of the Governor of the State, to be made as hereinafter provided.

This law was subsequently declared by the Supreme Court to be unconstitutional.

The act to enable settlers on State lands to obtain titles thereto is as follows:

SECTION 1. That from and after the passage of this act, actual settlers on any of the public lands belonging to this State subject to entry may and are hereby permitted to enter the lands on which they reside or have in cultivation, not to exceed one hundred and sixty acres, to be taken in a compact form according to legal subdivisions, at the prices now or hereafter established for such lands, by paying one third of the purchase-money at the time of making entry, one third of the same within two years thereafter, and the remaining one third in three years after the date of entry.

Sec. 2. The person applying for the benefit of the preceding section shall make affidavit before some officer authorized to administer oaths that such application is made for his or her exclusive use and benefit, and that his or her entry is made for the purpose of actual settlement or cultivation, and not either directly or indirectly for the benefit of any other person, and that the lands applied for do not embrace the residence, cultivated lands, or improvements of any other person, and shall prove by the affidavits of two credible witnesses that he or she is residing upon the land applied for or has a part of the same in actual cultivation.

Sec. 3. No person shall be entitled to make more than one entry under the provisions of this act.

Sec. 4. In case of a failure to pay any of the installments upon any entry made under the provisions of this act for ninety days after the same shall become due, the entry shall become null and void, and that portion of the purchase-money already paid shall be forfeited.

Sec. 5. All persons entering lands under the provisions of this act shall be assessed for and pay taxes on the land so entered, from and after the date of entry and first payment thereon, and a failure to pay the taxes assessed thereon shall cause a forfeiture of all the benefits of this act and the part of the purchase-money paid in.

The Governor vetoed a bill providing that—the seat of government be changed from Tallahassee, in Leon County, to Gainesville, in Alachua County, or such other place in this State which a majority of the registered voters of the State shall select: *Provided*, that the removal of the seat of government and the erection of the Capitol building shall be accomplished without cost to the State.

A committee appointed to investigate certain charges of official misconduct against Chief-Justice E. M. Randall made a report, exonerating him, which was adopted.

The act to regulate the practice of medicine

provides for the appointment by the Governor of six boards of medical examiners, to be located respectively at Tallahassee, Jacksonville, Pensacola, Key West, Ocala, and Tampa, whose duty it is to examine candidates for practice, not graduates in medicine, and issue certificates to those found competent.

The joint committee of the Senate and Assembly appointed to go to Jacksonville to obtain information regarding the indebtedness of the Internal Improvement Fund, reported the following statement of the amount of coupons of bonds of the railroad companies guaranteed by the trustees of the Internal Improvement Fund, which have been filed in court and verified as reported by A. Doggett, Special Master, with interest on the coupons from maturity, the payments made thereon, and the balance now due:

RAILROAD COMPANY.	Amount of coupons.	Interest on coupons.	Total principal and interest.	Payments made.	Balance due.
Florida.....	\$300,615 00	\$227,664 77	\$528,279 77	\$75,813 59	\$452,466 18

After the first of January a remarkable activity in the sale of State lands was manifested. The following are the sales for five months:

INTERNAL IMPROVEMENT AND SWAMP LANDS.

MONTHS.	Acres.	Amount.
January.....	4,374·98	\$4,113 26
February.....	27,602·42	22,977 83
March.....	8,805·32	10,896 83
April.....	33,298·45	20,713 96
May.....	14,397·37	12,453 83
Total.....	90,568·54	\$71,150 26

SCHOOL AND SEMINARY LANDS.

LANDS.	Acres.	Amount.
Total sales.....	6,370·00	\$3,957 00

Since the 1st day of January, 1879, these patents for swamp-lands have been received from the United States:

	Acres.
Patent No. 19, former Tallahassee (now Gainesville) district.....	4,639·80
Patent No. 12, former St. Augustine (now Gainesville) district.....	29,509·75
Patent No. 1, Gainesville district.....	15,761 86
Patent No. 17, former Tampa (now Gainesville) district.....	532,360·34
Patent No. 13, former Tampa (now Gainesville) district.....	313,514·63
Patent No. 19, former Tampa (now Gainesville) district.....	536,995·15
Patent No. 20, former Tampa (now Gainesville) district.....	2,282,667·07
Total.....	3,765,448·65
The quantity previously patented was.....	10,667,016·15
Making total patents received.....	14,442,404·80
The quantity disposed of prior to January 1, 1877, was.....	1,497,272·27
Disposed of since.....	187,457·15
	1,684,729·42
Balance on hand.....	12,757,785·38

A census of the Indians of South Florida was taken a year or two since, giving a total population of 203. This has been augmented by the natural increase, and they may now be set down at 225. The chiefs are always chosen from the family or faction of the "Tigers," it being a tradition among the Indians that if the selection be made from the "Wolves," the "Snakes," or the "North Winds," the administration of the incumbent will be short-lived. A general council is called annually in the green-corn season, when a trial is had of all offenders against the laws. This is also a legislative body, where new laws are enacted and modifications made in those already passed.

A question arising as to the effect of a conviction for petit larceny before a justice of the peace upon the right of suffrage, the Supreme Court decided that, under the Constitution and laws, such conviction disqualified the offender from voting.

Captain H. S. Duval, United States deputy surveyor, returning from an expedition in South Florida, reports that the country marked as the Everglades, as far as he surveyed, consists of high, rolling lands, covered with a large growth of pine, with here and there large bodies of hammock-land which seemed richer than he had ever before seen in an experience of thirty-one years in surveying in Florida.

He regards the Everglades as partially a myth, though doubtless there is something of the kind, but covering but very little ground, immediately south of the great Okechobee Lake.

For the year ending June 1st, the total value of merchandise transported on the Chattahoochee River, including the Apalachicola and

Flint Rivers, was \$5,787,140, against \$4,398,000 for the previous year, which is a gain of \$1,389,140, or an increase of 31 per cent. In 1879 it was only \$3,760,000.—The river freights aggregate for the year \$265,960, against \$196,800 the year before, a gain of \$69,160, or an increase of 30 per cent. In 1879 the river freights were \$156,558.

The items of appropriation for Florida, as contained in the River and Harbor Bill of the last Congress, are as follows:

Improving Appalachicola Bay, Florida.....	\$10,000
“ Appalachicola River.....	1,500
“ Tampa Bay, bar, and channel.....	10,000
“ Choctawhatchee River.....	10,000
“ Entrance to Cumberland Sound.....	100,000
“ Escambia River.....	5,000
“ St. John's River.....	100,000
“ Pease Creek.....	7,000
“ Withlacoochee River.....	7,500
“ Suwannee River.....	8,000
“ Volusia bar.....	5,500
“ Pensacola Harbor.....	20,000
Total.....	\$279,500

In addition an appropriation was made for Pensacola Harbor of \$75,000. The River and Harbor Bill also provides for surveys of Dog Island Harbor, harbor of Key West, Crystal River, La Grange Bayou up to Freeport, Manatee River, Crooked River, Indian River at north end, in view of opening a passage into the lagoon one half mile east; also, for a survey and estimate for a canal connecting St. John's River, Matanzas River, and the Indian River, and for opening and deepening channels so as to make steamboat communication to Jupiter Inlet.

The following table from the census reports, based on the crop of 1879, gives the acreage and yield of cotton in this State:

COUNTIES.	Acreage.	Bales.
Alachua.....	14,616	2,519
Baker.....	1,107	215
Bradford.....	5,886	1,094
Brevard.....	6	2

A State Immigration Convention was held, which was well attended, and after discussion adopted the following resolutions:

Whereas, It is the sense of this convention that each county is a constituent part of the whole State, and is profited by the prosperity of all other counties; therefore,

Resolved, That each county can best serve both herself and sister counties by collecting and placing before the public all the facts which will invite labor and capital.

Resolved, That county associations for the collection of data that will furnish truthful information are earnestly invited, and that all counties who have not formed associations are earnestly urged to do so.

Resolved, That we extend a cordial welcome to all foreigners who may come to settle among us, and that the Commissioner of Immigration take measures to disseminate information in regard to the great natural resources of the State among that class of people.

Resolved, That all steamboat and railroad lines entering into and traversing the State of Florida, or any part thereof, be and they are hereby earnestly requested by this convention to pass all immigrants with their household chattels over their respective lines at liberally reduced rates.

Resolved, That this convention considers the importance of a proper display of the various products, woods, minerals, and other evidences of Florida resources at the exposition at Atlanta as one that commands a duty on the part of her citizens to make such arrangements as will secure a display that will truly represent the great resources that we are blessed with,

and of which, by our peculiar situation, we have a monopoly.

Resolved, That a committee of three be appointed by the Chair to frame a suitable address to the citizens of the several counties, recommending that they immediately organize county immigration societies to co-operate with the Bureau of Immigration after the method suggested by the commissioner, and that they urge the immediate preparation by the citizens of each county of a descriptive article of their respective counties, not to exceed 2,100 words, the same to be sent to the office of the Commissioner of Immigration for introduction in a new State pamphlet, to be issued as soon as the data can be received.

Resolved, That it is the sense of this convention that the next Legislature of the State should make an adequate appropriation for immigration purposes.

Resolved, That this convention recommend to the State Bureau of Immigration to have pamphlets descriptive of Florida printed in the different languages of European countries from which the State expects immigration, and that said pamphlets be distributed among the masses of said European countries.

A very important contract for the sale of State lands was entered into during the summer, the purchasers being Hamilton Disston and associates, of Philadelphia, who proceeded to organize the Atlantic and Gulf Coast Canal and Okechobee Land Company, with a capital of \$10,000,000 in 1,000,000 shares. The contract was for the sale of 4,000,000 acres for the sum of \$1,000,000, deeds to be delivered and payment made in installments. These lands lie south of Ocala and largely east of the Kissimmee River, being chiefly in the counties of Orange, Sumter, Volusia, Marion, Hillsborough, Hernando, Polk, Manatee, and Monroe. The sale of this land had the effect of releasing from incumbrances the public domain which had been set apart for internal improvements. The remainder of this, 8,000,000 or 9,000,000 acres, will be applied to the development of the internal resources of the State. The company propose to drain the Okechobee Swamp, and to dig a canal from the St. John's River to Lake Worth. One half of the reclaimed land is to belong to the State. The company intends to colonize the lands as soon as reclaimed. It is expected that about 12,000,000 acres will be reclaimed. A company was also formed by Mr. Disston to construct a ship-canal across the State. The route will be by the way of the Coloosahatchee River, Lake Okechobee, and thence to the Atlantic Ocean, at or near the mouth of the St. Lucia River. The capital is \$30,000,000. The Fernandina and Jacksonville Railroad was completed during the year, as was also the Waycross road from Jacksonville to Forest City. Three projected lines will run through the Disston purchase. They are the South Florida Railroad, the Jacksonville, Tampa and Key West Railroad, and the Peninsular Railroad.

Near the end of the year the Disston company sold half of its 4,000,000 acres to English and Dutch capitalists, represented by Sir Edward Reed and Dr. Wertheim. This party obtained control of the Transit Railroad and its branches, including the Peninsular Railroad and its branches. By this transaction, they

completed a railroad combination involving the union of the Florida Central, the Jacksonville, Pensacola and Mobile, the Transit and Peninsular, four roads with numerous branches, under one management, backed by abundant capital for development.

This combination includes 484 miles of completed railroad and 144 miles of proposed extension, making a total future scope of 628 miles. The following units make up this total:

The Florida Transit from Fernandina to Cedar Keys, 155 miles, Jacksonville Branch, 21 miles; the Peninsular Road completed for 50 miles to Ocala, with a two-mile branch to Silver Springs, and a projected extension (under the name of the Tropical Railroad of Florida) which has 15 miles completed beyond Ocala, 85 graded, and which will, when completed to Tampa or Charlotte Harbor, include 210 miles. Next, the Florida Central from Jacksonville to Lake City, 59 miles; the Jacksonville, Pensacola and Mobile, from Lake City to Chattahoochee, through Tallahassee, 157 miles, with a four-mile branch to Monticello, and a branch road to St. Marks of 21 miles. There is also a prospective branch from the Tropical Railroad to Brooksville of 8 miles, and a Tampa Branch of 20 miles.

The population of the State by counties, with white and colored distinguished, as returned by the census of 1880, is as follows:

COUNTIES.	Total.	White.	Colored.*

Cut for the census year ending May 31, 1881 (excluding 77,500,000 feet, estimated, grown in Alabama, and sawed in Western Florida)..... 203,054,000

In this estimate no account is made of timber remaining on lands which have been cut over, or of that injured by the manufacture of turpentine.

The months of January and February were marked by exceptionally cold periods, and much damage was done to orange-groves and tropical plants. It was estimated that there would be shipped from the State this year not less than 75,000,000 if not 80,000,000 oranges, and that the yield would exceed this amount by 5,000,000. The yield in eight counties in Eastern Florida and Sumter County would not be less than 40,000,000, while Western and Southern Florida would produce 30,000,000 more.

Judge A. A. Knight, supervisor of the census for Florida, to whom was also assigned the duty of preparing the orange statistics of the State, furnishes the following figures:

COUNTIES.	Bearing trees.	Yield.	Value.
Alachua.....	13,111	2,250,000	\$33,750
Baker.....	21	9,450	142
Bradford.....	3,377	333,550	4,515

and 2 Indians; in Nassau County, 3 Chinese and 6 Indians; in St. John's County, 2 Chinese; in Volusia County, 1 Indian.

No returns were received from fourteen of the thirty-nine counties. With the exception of Nassau, the counties not reporting are situated in Middle and West Florida. The oranges were valued at \$15 a thousand, and the average yield per tree was 154. Within the next five years, the number of bearing trees and their yield will probably be increased five-fold.

FOGG, GEORGE GILMAN, born at Meredith, New Hampshire, May 26, 1813; died at Concord, N. H., October 12, 1881. Having received from his parents, who were in humble circumstances, a good preparation for college, he entered Dartmouth, from which institution he graduated in 1839. Mr. Fogg then read law with Hon. Warren Lovel and Stephen Carr, of Meredith, and commenced practice, at Gilman-ton, in 1842. At an early age he engaged actively in politics, and entered the career which subsequently conducted him to a position of eminent distinction among the public men of New Hampshire. Originally a Democrat, he became one of the most influential workers in the organization known as Independent Democrats. In January, 1845, the Texas question caused the withdrawal of John P. Hale from the Democratic party. The next month an organization was effected, at Exeter, by malcontent Democrats, who refused to consent to Mr. Hale's rejection on account of his antislavery views. This new party took the name of Independent Democrats, nominated Mr. Hale for Congress, published an address and resolutions, and boldly appealed for support to their brethren throughout the State. At the election in the month following the Democrats chose three of their four candidates for Congress on a general ticket, but failed to elect the nominee in place of Mr. Hale. A special election was ordered to fill the vacancy, and, pending the canvass, the supporters of Mr. Hale established an organ at Manchester, which was called "The Independent Democrat." Soon after, the paper was removed to Concord, and Mr. Fogg, having been a contributor to the same, was made its editor. He then abandoned his profession, removed to Concord, and became a regular journalist, and continued such until 1861, when he was appointed Minister to Switzerland by President Lincoln. As a newspaper writer Mr. Fogg exerted a strong influence in and out of his own State. His intimate knowledge of the Democratic party gave him a vast advantage in the faction to which he had allied himself, and enabled him to contend successfully with the experienced politicians arrayed against it. In 1845 several unsuccessful attempts were made to fill the congressional vacancy. At the State election in March, 1846, the Independents succeeded in choosing to the Legislature a sufficient number of Representatives and Senators to hold the balance of power between the two old parties, and also, having a candidate of their own in the field for Governor, to defeat the Democratic nominee for that office.

At the legislative session in June, a compromise was effected between the Whigs and Independents, by which Anthony Colby, of New London, the candidate of the former, was elected Governor; Mr. Fogg, Secretary of State; and John P. Hale, United States Senator for six years. At the election in March, 1847, the Democrats chose two of the four Representatives to the Thirtieth Congress. In July, at a special election, Amos Tuck, of Exeter, formerly a Democrat, and James Wilson, of Keene, who had left the Whig party, were triumphant over their Democratic competitors. The combination to elect Tuck and Wilson to Congress completed, in New Hampshire, the work of forming a new party, which had begun when Mr. Hale was chosen to the Senate in 1846. This coalition was, in fact, the Republican party, first in the field in New Hampshire, and nine years before like combinations in other States assembled in convention in Philadelphia in 1856.

In November, 1855, the subject of this sketch was appointed Reporter of the Supreme Court, and held this office until his resignation in June, 1859. He was a prominent member of the convention that nominated Abraham Lincoln for President, and was Secretary of the National Executive Committee which conducted the first campaign with that candidate. Mr. Lincoln offered Mr. Fogg the position of Commissioner of Patents, which was not accepted; and afterward, in 1861, he received the appointment of Minister to Switzerland. From this mission he was recalled in 1865, and, in his letter to Secretary Seward, dated Berne, June 22, 1865, he complained that he was allowed only five weeks in which to vacate that important place, without having been previously notified of his intended removal. After his return from Europe, he resumed his residence in Concord; and in August, 1866, was appointed by Governor Smythe to fill the vacancy in the United States Senate caused by the resignation of Hon. Daniel Clark, of Manchester, who had been appointed United States Judge. The later years of Mr. Fogg were clouded by some disappointments, among which was his failure to retain the place of leading editor to "The Independent Democrat," after that journal formed a coalition with the Concord "Daily Monitor." From this time he withdrew from politics, and became a quiet supporter of Republican candidates, not always voting his party ticket in full. Mr. Fogg was actively connected with the New Hampshire Historical Society, was a trustee of Bates College, and in his religious belief a Unitarian.

FORNEY, JOHN W., born in Lancaster, Pennsylvania, September 30, 1817; died in Philadelphia, December 9, 1881. At the time of his death Colonel Forney was editor of the "Progress," in Philadelphia. At an early age he gave evidence of talents that made him one of the most distinguished journalists and poli-

ticians of the United States. He began life as a shop-boy in a village store, but, being ambitious, gave up that work and found employment in the printing-office of the Lancaster "Journal." He applied himself easily to typesetting, and by his great industry and good behavior secured the confidence and esteem of his employer. In his twentieth year he was able to purchase the Lancaster "Intelligencer," a strong Democratic paper, and such was his success that in 1840 he bought the "Journal," united it with his former purchase, and published both under the title of "Intelligencer and Journal." Lancaster County was then the stronghold of the Whig party, and Mr. Forney acquired a wide-spread reputation for the ability and consistency with which he advocated Democratic principles. In 1845 President Polk appointed him Deputy Surveyor of the Port of Philadelphia. He disposed of his paper, removed to that city, and commenced the duties of his office. Soon after his arrival he bought a half share in the old "Pennsylvanian," then the leading Democratic organ of the State. His connection with this paper lasted till 1853. Two years previous to that date he was elected Clerk to the House of Representatives, and removed to Washington. For a long time he was presiding officer of the House, and officiated during the exciting struggle for the election of Speaker in 1855 and 1856. When the contest was ended, a resolution was unanimously carried, thanking Mr. Forney for the ability and impartiality with which he had presided over the deliberations of the House. He subsequently became one of the editors of the Washington "Union," and held the position until 1856. When James Buchanan was nominated for President, Mr. Forney was immediately elected chairman of the Democratic State Central Committee of Pennsylvania, and by his energy and talent contributed greatly to the election of President Buchanan. In January, 1857, Mr. Forney was a candidate for the United States Senate. Although very popular in his native State, and receiving the support of not only many of the newspapers, but of the President himself, who wrote a letter to a personal friend in the Legislature in which he said, "When asked, I have always said that I preferred Mr. Forney, and I should esteem it a friendly act toward myself for any person in or out of the Legislature to support him"; and in spite of his obtaining a large majority in the caucus nomination on the first ballot, Mr. Forney by various means was defeated. After his defeat he returned to Philadelphia, and retired for a time into private life.

In August, 1857, he began the publication of the "Press," an independent Democratic newspaper in Philadelphia. Having exhausted his funds in the political campaign, he purchased the type on credit, and having no machine, the paper was printed for months in the office of the "Sunday Dispatch." The "Press"

extended a cordial support to Mr. Buchanan's Administration up to the time of the adoption of the Lecompton Constitution, and the effort to secure the admission of Kansas into the Union under it. Mr. Forney resolutely opposed that measure, which caused a disruption of the friendly relations which had previously existed between the President and himself. The result of the struggle now forms a part of the political history of the period. Few men in the country contributed more than Mr. Forney to strengthen the Republican party, and to prepare it for the contest of 1860. In December, 1859, he was for the second time elected Clerk of the House of Representatives, and soon after started a Sunday paper in Washington called the "Sunday Morning Chronicle." This venture was successful, and was published as a daily.

In 1861 he was elected Secretary of the United States Senate. Abraham Lincoln, Charles Sumner, and Schuyler Colfax were his warm supporters. For six years he discharged the duties of that position with distinction. He was one of the most fervent and influential supporters of the Administration. On the death of Lincoln, Mr. Forney supported Andrew Johnson for a short time, but, when the "Press" declared editorially against him, Mr. Forney was one of the foremost in the struggle which resulted in his impeachment.

In March, 1871, Mr. Forney became Collector of the Port of Philadelphia, having some time before resigned the secretaryship of the Senate. During the one year he held the office he earned the gratitude of many merchants by converting from a dead letter into a living reality the system of direct transportation of imports in bond without appraisement and examination at the port of original entry. This achievement, it has been claimed, laid the foundation for the rapid increase in foreign trade which has marked the history of Philadelphia during the last few years. As one of the chief promoters of the Centennial Exposition, he visited Europe as a commissioner, and was instrumental in bringing about its success. He advocated the opening of the permanent exhibition every day of the week, and contended for Sunday cars and universal suffrage. On his return from Europe, Mr. Forney sold the "Press" for \$180,000. In his editorial farewell to his staff he said: "The 'Press' was the outgrowth of my best impulses. It was twenty years old on the 1st of August, 1877. I have done my best to make it a good, honest newspaper. It has lived through many tempests and changes. It has received and returned many blows. Its opinions have been its convictions. It has often given offense in the championship of a cause or a principle. But I can say for myself that in all this long course of time I have never deliberately wounded or injured a human being, even in the fiercest struggles of political or sectional difference; and I hope I may be permitted to

add that in more than fourteen years of official responsibility, with millions of public money to hold and disburse, not a dollar has been misapplied or devoted to my personal use. I recur to these recollections with pride, now that my connection is about to close with the newspaper which I founded. My experience with the 'Press' has been one of uninterrupted satisfaction. I have never been truly happy away from my editorial desk. Office and honors have all been nothing to the substantial pleasures of my journalistic work." Of late years he devoted much time and attention to his newspaper, the "Progress," and confidently anticipated a great success in the enterprise.

FOSSIL BIRDS. The first discovery of any trace of a fossil bird of an earlier geological period, was the observation of the impression of a feather in a slate-rock at Solenhofen. It was described by H. von Meyer in 1861, under the specific name *lithographica*, but subsequently received the name *Archæopteryx macrura*. An imperfect specimen of the same species was described by Owen, and a complete fossil, discovered in 1875, by Carl Vogt. This was of the size of a pigeon. The small head, of nearly flat, pyramidal form, was of the true reptilian type in the configuration of its bones. The neck, the thorax, the ribs, the shoulder-girdle, the fore-limb, and the tail were all formed like those of reptiles. In the upper jaw two small, sharp, conical teeth were discerned. The *remiges* of the wings were fixed to the ulnar edge of the arm and to the hand, and were covered for half their length with down. The hind-foot was that of a bird. Birds' feathers covered the tibia for its whole length. The main part of the body was naked. Structurally the *Archæopteryx macrura* was more closely allied to reptiles than to birds, but with wings, feathers, and birds' feet it possessed the most marked avian characteristics, and can therefore be classed neither among the reptiles nor the birds. Professor Huxley proposes the name *Sauropsids* for a single great section of vertebrates, including both reptiles and birds.

The two specimens of the genus *Archæopteryx* found in Europe were imbedded in Jurassic strata. Their structural features as well as their stratigraphical position mark them as belonging to an earlier age than the fossil birds afterward found in the cretaceous deposits of the eastern slope of the Rocky Mountains, which are described below. In the cretaceous formations of England a few specimens of avian fossils have been found, but only fragments of bones, which afford no nearer indications of the forms which they represent than that they are the bones of birds.

Not long after the first transitional form, linking these two great divisions of vertebrates, was discovered in Europe, an entire series of toothed birds and flying reptiles was brought to light in the uninhabited West of the United

States. The scientific exploration of these wide regions, which has been promoted by the rational policy of the Government at Washington, has revealed more important forms of extinct life, and enriched the sciences of paleontology and comparative biology with more valuable data in recent years than the discoveries in all other lands together. Of these discoveries, the group of toothed birds classified by Professor O. C. Marsh, which he has ranged in a sub-class, giving to this the name *Odontornithes*, is perhaps of higher scientific value than all the rest, not excepting the hipparion, through which the Darwinians have traced the ancestry of the horse, and which has furnished them with an effective argument in support of the development theory. In the same geological horizon in which the *Odontornithes* were discovered a great number of pterodactyls, or flying reptiles, were found. All these belong to a new order, the chief characteristic of which helps to bridge the gap between birds and reptiles in an important particular, and one complementary to the missing link afforded in the leading mark of the *Odontornithes*. This is the absence of teeth, on account of which peculiarity the name *Pteranodontia* was bestowed upon the order. The affinity is traced further back in a group of wingless reptiles of an earlier period, which are likewise toothless. They are called the *Sauranodontia*, and are allied to the iethysaurus. The *Pteranodontia* were gigantic animals, some of them having a spread of wings measuring twenty-five feet.

In the course of his ten years' researches before the publication of his monograph on the *Odontornithes*, which forms vol. vii of the publications of the "Survey of the Fortieth Parallel," and the first of the "Memoirs of the Peabody Museum of Yale College," and is the opening volume of a work which will embody all his investigations of the extinct *Vertebrata* of North America, Professor Marsh had distinguished twenty species and eight genera of toothed birds. Over a hundred specimens of this type of animals were found. These are preserved in the Peabody Museum of Natural History at New Haven. Many of them are remarkably complete; but some of the species are represented by very fragmentary remains. The first discoveries of these fossil birds were made in 1870 by Professor Marsh, who revisited the field the following season and the next, afterward delegating the exploratory work to others.

The eight genera and twenty species described in Professor Marsh's monograph are as follows:

Apatornis celer,	Iethyornis lentus,
Baptornis advenus,	" tener,
Graculavus velox,	" validus,
" pumilus,	" victor,
Hesperornis regalis,	Laornis Edwardsianus,
" crassipes,	Paleotringa littoralis,
" gracilis,	" vagans,
Iethyornis dispar,	" vetus,
" agilis,	Telmatornis priscus,
" anceps,	" affinis.

The remains hitherto discovered in America of these strange forms of the Mesozoic age belong to the Cretaceous period. Earlier types will probably be found in the Jurassic deposits, and possibly still lower down. The three-toed foot-prints in the Triassic beds of the Connecticut Valley, which attracted much attention a few years ago as presumably the tracks of birds, are now almost unanimously ascribed to the dinosaurian reptiles whose bones are found in the same deposits. Remains of birds have been found on the Atlantic coast in the cretaceous rocks, notably in the greensands of New Jersey. These fossils consist only of separate bones, which do not allow of being strictly classified. The specimens from the West are many of them nearly complete skeletons, which cast a flood of light upon the origin of the bird type. They were exhumed from the cretaceous strata of the plains of Kansas and Colorado, which consist for the main part of fine yellow chalk and calcareous shalc, marine deposits undisturbed by upheavals, in which the numerous fossils of the reptile age which they contain are preserved in an almost perfect condition. The geological horizon of the *Odontornithes* thus far discovered is within the Middle Cretaceous. The strata in which they have been found, named by Marsh the Pteranodon beds, contain besides these species abundant remains of Mosasauroid reptiles, Plesiosaurs resembling the *Pliosaurus* type, the Pteranodons or toothless Pterodactyls, and multitudinous fishes.

The Mesozoic birds divide themselves into two distinct and widely divergent types; but, as they both possess teeth, they are included in the new sub-class of *Odontornithes*. One type, represented by the genus *Hesperornis*, is that of large, wingless, aquatic birds, some of them of enormous size, whose teeth were fixed in grooves. The other group, of which the genus *Iethyornis* may be taken as the typical representatives, are small birds with large wings and remarkably light and hollow bones, whose flying powers must therefore have been enormous. Their teeth were fastened in sockets, and their vertebræ were biconcave.

Marsh has found a fossil bird in the Jurassic *Atlantosaurus* beds of Wyoming, the oldest representative of the class except, perhaps, the *Archæopteryx*. The name given to the species is *Laopteryx priscus*. The specimen consists of a portion of the skull, which indicates a bird larger than the blue heron. The bones of the skull are pneumatic. In general character it resembles the *Ratita*. The bird probably possessed biconcave vertebræ, and was furnished with teeth, as one was found in the matrix similar to those of the *Iethyornis*.

FRANCE (RÉPUBLIQUE FRANÇAISE). By the terms of the present Constitution, voted by the National Assembly in 1871, and bearing date February 25, 1875, the legislative power is vested in an Assembly of two Houses—the Chamber of Deputies and the Senate; and the

executive power in a chief magistrate called President of the Republic. The deputies are elected, for the term of four years, by universal suffrage, under the *scrutin d'arrondissement* adopted by the National Assembly on November 11, 1875, each *arrondissement* returning one deputy; and, if its population be over 100,000, an additional deputy for each 100,000 or fraction thereof. At the general election of 1878 the *électeurs politiques* (persons having a right to vote) numbered 9,992,329. Citizenship and twenty-one years of age are the only requisites to be an elector. The number of deputies in 1881 was 557. The Senate is composed of 300 members; 75 hold their seats for life, vacancies being filled by the choice of the Senate; and 225 are elective, one third of their number retiring every three years. Twenty-five years of age and citizenship are the only requisites to be a deputy, and forty years of age and citizenship to be a senator. Both the senators and the deputies receive pay for their services, at a fixed rate per diem. In the budget for 1880 the expenses of the Senate were estimated at 3,865,600 francs, and those of the Chamber of Deputies at 6,521,000. Both bodies assemble on the second Tuesday in January of each year unless previously convoked by the President of the Republic, and must remain in session at least five months out of the twelve. The President can adjourn the Chambers, but not more than twice in one session, nor for a longer period than one month at a time. The Senate possesses conjointly with the Chamber of Deputies the right of initiating and framing laws; but financial laws must first be presented to and voted by the deputies. For all practical purposes the four years' existence of the Chamber is a single session, with mere adjournments. A dissolution alone annuls all bills pending in it. The Senate, however, is never dissolved, and bills are now taken up by it one session at the stage they had reached in the previous one. Indeed, a year has repeatedly intervened between the passing of a bill in one House and its passing in the other. A measure which became a law on November 15, 1881, abolishing the last vestige of ecclesiastical control over cemeteries, deserves notice as having been the first to profit by this continuity of parliamentary proceedings. Introduced by a private deputy during the session previous, and adopted by the Chamber, it was sent up to the Senate, but too late for discussion before the prorogation. When, in 1877, the Senate had for the first time to decide how pending bills were affected by a dissolution of the Lower House, and with the option of making a *tabula rasa*, of taking up bills at the pre-dissolution stage and passing them without sending them back to the Chamber if unamended, or of passing them and sending them down to the Chamber like measures initiated in the Senate, its decision was that bills introduced into the Chamber by private

deputies should be expunged, and Government bills alone proceeded with. In 1881, however, the Senate resolved, under the inspiration of its president, M. Léon Say, to place all pre-dissolution bills on an equal footing. The President of the Republic, elected for a term of seven years by a majority of votes by the Senate and Chamber of Deputies united in National Assembly, may be re-elected; has the initiative of legislation concurrently with the two Houses; promulgates the laws voted by both Houses; disposes of the armed force of the nation, and appoints all civil and military functionaries, including the members of the Cabinet: but every act of the President must be countersigned by a minister. He may, with the assent of the Senate, dissolve the Chamber of Deputies before the expiration of its legal term; but the electoral colleges must in such event be convened for new elections within three months. Pursuant to a special article appended to the Constitution of 1875, and dated July 16th of that year, the President can not declare war without the previous assent of both Houses. In case of a vacancy by death or any other cause, the Senate and Chamber of Deputies must immediately proceed to the election of a new President. The President of the Republic is responsible only in case of high treason; but the Cabinet is responsible to the Senate and Chamber of Deputies for the general policy of the Government, and the ministers individually for their personal acts.

The President of the Republic is M. Jules Grévy, elected January 30, 1879; and the Cabinet, at the end of 1881, was composed of the following ministers: Foreign Affairs, M. Léon Gambetta, President of the Council; Interior, M. Waldeck-Rousseau; Finance, M. Alain-Targé; Justice, M. Cazot; Commerce and the Colonies, M. Rouvier; Public Instruction and Worship, M. Paul Bert; Public Works, M. Raynal; War, General Camponon; Marine, M. Gougeard; Agriculture, M. Devès; Fine Arts, M. Proust; Posts and Telegraphs, M. Cochery.

In this new ministry, dating from November 14, 1881, is to be observed the severance of the Department of Worship from the Interior, and its reattachment to Public Instruction, from which it used to be temporarily disjoined when the latter portfolio was held by a Protestant. By the change, M. Paul Bert, who, in his memorable lecture in September last, affirmed that nations receded from religion in proportion as they advanced in morality, was the man appointed to transact business with the Catholic prelates. The clerical press evinced irritation at the appointment of M. Bert. One paper declared it scandalous and insolent; some republican journals likewise demurred to it; one paper noted that Worship was "handed to a man who has hitherto treated it as a pamphleteer rather than as a statesman"; while another styled it an act both of "bad policy and bad taste"; and the clerical

organs uttered comments on the foreign extraction of both the Minister and the Under-Secretary of Foreign Affairs, the former being the son of a Genoese, and the latter (M. Spuler) of a Baden immigrant. The motives assigned (in the decrees) for the creation of the two new portfolios of Agriculture and Fine Arts, formerly coupled respectively with Commerce and Public Instruction, were as follows: That agriculture is the chief element of national wealth; that the Minister of Commerce is sufficiently occupied with international exchanges, customs, and commercial treaties; that Germany, America, Austria, and Italy have made agriculture a distinct department; that foreign competition, bad harvests, and the phylloxera have placed French agriculture in a critical condition; and, as regards art, that nations, but lately imitators of France, have (as proved by the last exhibition) become her rivals in the influence of art-training on producing forces, and in the importance of strengthening technical education. The Minister of Agriculture was to have charge of surveys and subsidies for irrigation, drainage, dredging canals, water-supply, and agricultural improvements; the Minister of Arts, of public buildings, cathedrals, art and technical schools, and drawing classes.

France, with an area of 528,572 square kilometres (204,081 square miles), is divided into 87 departments, and had, according to the census of 1876, a population of 36,905,788.

The movement of population from 1869 to 1878 was as follows:

YEARS.	Births. Exclusive of still-births.	Deaths.	Surplus of births (B.) or deaths (D.).
1869	948,526	864,320	B. 84,206
1870	944,115	1,046,909	D. 103,834
1871	826,121	1,271,010	D. 444,815
1872	966,000	793,064	B. 172,936
1873	946,804	844,558	B. 101,776
1874	954,652	781,709	B. 172,943
1875	950,975	845,062	B. 105,913
1876	966,682	884,074	B. 182,608
1877	944,576	801,966	B. 142,620
1878	937,317	839,076	B. 98,241
1879	936,529	839,582	B. 96,647

The number of still-births, 39,778 in 1863, had in 1879 reached 43,875.

The relation of marriages to the total population from 1871 to 1877 was as follows:

YEARS.	Total population.	Marriages.	Number of marriages to 100 inhabitants.
1871.....	36,544,067	269,476	0.72
1872.....	36,102,921	252,754	0.98
1873.....	36,260,925	321,283	0.89
1874.....	36,883,431	303,113	0.83
1875.....	36,542,910	300,427	0.82
1876.....	36,905,788	291,898	0.79
1877.....	36,977,093	275,094	0.75
1878.....	37,119,720	279,650	0.76

The number of marriages registered in 1879 was 282,776.

By the terms of the law of July 29, 1881, the budget estimates for 1882 were as follows:

REVENUE.	France.
Direct taxes.....	899,994,100
Stamps and registration duties.....	712,227,500
Product of the forests.....	88,558,600
Customs and salt.....	381,588,000
Indirect contributions.....	1,083,743,000
Posts and telegraphs.....	140,699,700
Surplus of the budgets of 1877, 1878, and 1879...	50,616,000
Three per cent tax on personal property.....	40,485,000
Universities.....	8,485,906
Receipts from prisoners' labor.....	7,587,155
Revenue of Algeria.....	26,990,100
Tax on civil pensions.....	20,664,000
Miscellaneous receipts.....	49,876,162
Total (ordinary) revenue.....	2,556,535,223

EXPENDITURES.	France.
Public debt and dotations.....	1,235,339,577
Ministry of Justice.....	85,572,992
“ of Foreign Affairs.....	13,755,800
“ of the Interior and of Worship.....	189,693,106
“ of Finance.....	19,561,992
“ of Posts and Telegraphs.....	1,995,560
“ of War.....	571,895,585
“ of Marine and the Colonies.....	197,043,497
“ of Public Instruction and Fine Arts.....	114,353,941
“ of Agriculture and Commerce.....	83,131,904
“ of Public Works.....	181,993,731
Total (ordinary) expenditures.....	2,554,282,905
Expenditures extraordinary.....	461,136,000

Grand total..... 3,315,869,905

The total public debt amounted, on January 1, 1879, to a nominal capital of 19,862,035,983 francs, the interest on which, or *rente*, was 748,404,952 francs. The nominal capital of each of the four classes of *rente*, the interest or amount of *rente*, and the number of *inscriptions* or individual holders thereof at the date just referred to, were as follows:

CLASS, or description of <i>rente</i> .	Nominal capital.	Interest, or amount of <i>rente</i> .	Number of holders of <i>rente</i> .
	France.	France.	
8 per cent.....	12,101,352,167	368,040,565	1,788,114
4 per cent.....	11,152,400	446,096	786
4½ per cent.....	882,061,176	87,442,779	159,459
5 per cent.....	6,917,472,240	345,873,512	2,432,574
Totals.....	19,862,035,983	748,404,952	4,830,933

The following table shows, from official returns, the number of holders and the amount of *rente*, at decennial periods, from 1798 to 1870, and in each of the later years therein expressed:

YEARS : January 1.	Number of holders of <i>rente</i> .	Amount of annual <i>rente</i> .
		France.
1798.....	24,791	26,111,785
1810.....	143,663	56,720,583
1820.....	199,697	172,754,883
1830.....	195,370	204,696,459
1840.....	265,447	195,911,187
1850.....	546,330	229,608,753
1860.....	1,073,801	338,356,559
1870.....	1,251,040	358,987,510
1871.....	1,269,789	386,232,843
1872.....	2,147,130	502,126,266
1876.....	3,473,475	626,120,206
1878.....	4,180,040	690,013,493
1879.....	4,380,933	748,404,952

The interest and other expenses connected with the national debt were given as follows in the budget for 1882:

Consolidated debt.....	743,026,239 francs.
Redeemable capital.....	840,432,273 "
Annuities and life-interests.....	151,881,060 "

Total outlay on account of the debt, 1,295,389,577 francs.

On January 1, 1873, the new army law of July 27, 1872, went into operation. Its first article enacts universal liability to military service. Every Frenchman capable of bearing arms must serve for twenty years, namely, five years in the standing army, four years in the reserve of the standing army, five years in the territorial army, and six years in the reserve of the territorial army.

By a law of July 24, 1873, on the reorganization of the army, France is divided into eighteen districts, each of which is occupied by an army corps. One army corps is also organized in Algeria. Each of the eighteen army corps consists of two divisions of infantry, one brigade of cavalry, one brigade of artillery, one battalion of engineers, one squadron of the train, a general staff and the subordinate staffs. By a law of March 16, 1880, the former general staff, which was a closed corps consisting of 513 officers, has been dissolved, and has been replaced by a new staff which is accessible to all officers who, after completing the course of studies in the military school, have obtained the staff brevet on the ground of their final examination. In this examination all captains may take part, even if they have not passed through the school. Moreover, officers of the staff may receive the brevet under special conditions fixed upon by the Minister of War. The Minister of War selects among the brevetted officers those who are to enter into the service of the general staff. In time of peace they remain in this service for four years, after which they return to their former position. They can not be recalled to the general staff until two years later. While serving in the general staff, their names remain on the lists of their own branch of the army, but they are kept there

"*hors cadre*." The brevetted officers who are not called into the service of the general staff form a reserve. The new general staff consists of 300 officers and 150 archivists. Outside of this *cadre* a land-surveying commission has been established in connection with the war depot, consisting of twelve officers.

The actual strength of the army on a peace footing in 1881 was 498,497 men, of whom 52,750 were in Algeria, while about 39,000 were absent on leave and in hospitals. Here follows the latest published classification by arms:

Infantry	288,163
Cavalry	68,907
Artillery	68,762
Engineers	11,007
Train	9,540
Administrative troops ..	27,990
Gendarmerie	26,511
Total	498,880

The total number of recruits in 1879 was 316,662, of whom 34,857 were rejected. Of the total number, 46,636 were unable to read and write, 9,931 were able to read only, 64,409 could read and write, 181,680 had an elementary education, 5,851 held degrees and diplomas, and of 9,155 the degree of instruction was unknown.

The navy, on January 1, 1881, comprised 356 vessels. Of these, 59 were ironclads (32 large war-vessels and 27 for coast defense); 235 steamers (57 cruisers, 39 dispatch-boats, 47 gunboats, 61 transports, and 31 torpedo-boats); and 63 sailing-vessels.

The foreign trade of France is officially divided into "commerce général," which comprises the entire imports and exports, including goods in transit, and "commerce spécial," which embraces the imports consumed and the exports produced within the country. The following table exhibits the movements of French commerce from 1859 to 1880 (value expressed in francs):

YEARS.	GENERAL COMMERCE.		SPECIAL COMMERCE.		GOLD AND PRECIOUS METALS.	
	Imports.	Exports.	Imports.	Exports.	Imports.	Exports.
1880.....	4,907,500,000	3,400,600,000	296,000,000	475,000,000		
1879.....	4,594,800,000	3,163,100,000	839,200,000	424,500,000		
1878.....	4,461,000,000	3,369,500,000	546,000,000	189,600,000		
1877.....	4,570,000,000	3,436,800,000	683,100,000	141,200,000		
1876.....	4,908,800,000	4,547,500,000	3,988,400,000	3,575,600,000	804,000,000	294,000,000
1875.....	4,461,800,000	4,807,000,000	3,536,600,000	3,572,600,000	228,000,000	219,000,000
1874.....	4,422,600,000	4,702,100,000	3,607,700,000	3,701,100,000	352,000,000	169,000,000
1873.....	4,576,400,000	4,822,300,000	3,554,800,000	3,757,800,000	565,000,000	492,000,000
1869-1873.....	4,107,000,000	4,061,300,000	3,342,500,000	3,259,700,000	462,000,000	371,000,000
1864-1868.....	3,813,800,000	3,988,800,000	2,858,700,000	2,961,800,000	799,000,000	451,000,000
1869-1863.....	2,346,600,000	3,088,200,000	2,121,100,000	2,271,000,000	607,000,000	513,000,000

France produced 680,316 gallons (U. S. wine measure) of wine in 1879, against 2,217,600,000 in 1875. The mean price per gallon from 1862 to 1867 inclusive was 36 cents, and the percentage of taxation upon the value, 14.55. The wine exported from France in 1879 was of the total value of \$45,917,000; and that imported, \$21,074,400. More than 4½ per cent of the area of France is vineyard, occupying 7,000,000 persons. Yet the wine consumed in

and exported from France is not all of French growth: 1,400,000 acres of vineyard had, up to 1881, been devastated by the phylloxera, and foreign wines are imported in ever-increasing quantities (nearly 15,700,000 gallons in 1880), mostly from Spain, Portugal, and Italy. The champagne exported to the United States in 1880 was of the value of \$2,317,593.

The chief sources of the imports and destinations of the exports in 1880 were as follows:

COUNTRIES.	Imports.	Exports.
	France.	France.
Great Britain	599,000,000	890,200,000
Belgium	415,000,000	429,400,000
Italy	357,800,000	180,400,000
Germany	413,000,000	343,500,000
Switzerland	103,200,000	246,500,000
Spain	182,800,000	149,600,000
Russia	343,000,000	34,200,000
Sweden, Norway, and Denmark	116,900,000	16,000,000

The principal articles of import and export in 1880 were as follows (in francs):

CLASSES.	Imports.	Exports.
Articles of food.....	2,153,868,000	809,234,000
Raw materials	1,777,724,000	532,044,000
Manufactured goods.....	438,965,000	1,668,832,000
Other merchandise	491,990,000	340,433,000
Total merchandise.....	4,907,547,000	3,400,639,000
Coins and precious metals...	295,759,000	475,073,000
Total.....	5,203,306,000	3,875,712,000

The port movements of the republic for the year 1880 were as follows:

FLAGS.	ENTREED.		CLEARED.	
	Number of vessels.	Tons.	Number of vessels.	Tons.
French	10,194	3,581,875	8,007	3,159,633
Foreign....	26,231	8,386,471	15,117	3,996,578
Total....	36,425	11,968,346	23,124	7,156,211

The merchant navy at the close of 1880 was as follows: .

DESCRIPTION OF CRAFT.	Number.	Tons.
Fishing-vessels	9,987	184,983
Coasting-vessels	2,399	111,599
Ocean-vessels	1,743	643,406
Yachts, etc.	929	29,310
Total, 1880.....	15,058	919,298
Total, 1879.....	15,033	982,853

Of the total number in 1880, 14,406 vessels, of 641,539 tons, were sailing-vessels, and 652, of 277,759 tons, were steamers.

The railroads of France are either main lines, which serve the general interest, or local lines. The former belong partly to the state Government, and partly to private companies. The latter will be assumed by the Government at the expiration of their charters. The number of kilometres in operation on January 1, 1881, was as follows:

Main lines	23,977
Local lines	2,159
Total.....	26,166

The number of kilometres in the course of construction, on the same date, was 6,038, of which 2,498 were built by companies, and 3,540 by the Government.

The statistics of telegraphs are as follows:

Length of lines in 1880, kilometres....	65,949
Length of wires in 1880	196,533
Stations in 1880	5,891
Total dispatches in 1880	16,493,897
Revenue	23,028,535 francs.
Expenditure	18,088,040 "

The latest postal statistics were as follows:

Number of post-offices in 1879.....	5,502
Number of letters sent in 1880.....	522,402,165
Number of postal-cards	30,119,434
Valuable letters.....	9,157,692
Newspapers.....	320,568,422
Samples and printed matter.....	356,805,848
Total articles sent	1,219,053,561
Receipts in 1879	104,769,735 francs.
Expenditure	76,271,510 "

The senatorial amendments to the Merchants' Shipping Bill having been accepted by the Chamber on January 30, 1881, the bill was promulgated on the following day. Clause four provides that, as compensation for the burdens imposed on ship-building by customs duties, a bounty shall be granted of 60 francs per ton gross on iron ships, of 20 francs on wooden ships of not less than 200 tons, of 10 francs on wooden ships of smaller size, of 40 francs on mixed constructions, and 12 francs per 100 kilogrammes on steam-engines and their accessories. Clause five accords, on vessels enlarged, similar bounties proportionate to the increase of tonnage, as also for steam-power inserted after the completion of the ships, together with a bounty of 8 francs per 100 kilogrammes for new boilers of French build. Clause nine grants a premium on long voyages for ten years, a compensation for the burden imposed on merchant shipping by navy recruiting and service. The premium begins at 1 franc 50 centimes per ton net for every 1,000 miles traversed by vessels of French build, and is reduced by $\frac{1}{2}$ of a centime for wooden or mixed ships, and by $\frac{1}{3}$

centime for iron ships. Vessels of foreign build will have only half this premium, save those already registered as French, which will have the full allowance, and steamers built on a plan previously approved by the Government will have 15 per cent extra. Fishing and pleasure craft and all vessels of subsidized lines are excluded from the premium. In the event of war, merchant-vessels may be called by requisition to the service of the State, and every ship receiving a premium on navigation will be bound to carry mails gratuitously, and a post-office official if required. Foreign ships wholly or partially changing hands are henceforth to pay 3 francs for admission to registration, instead of only 2 francs as before.

The number of authorized savings-banks on December 31, 1878, was 526, with 794 branches; the total number of books out being 3,173,721, representing an aggregate of 1,275,606,395 francs to the credit of depositors.

The area and the population of the French colonies and protected countries, according to the most recent official returns, are shown in the following tabular statement:

COLONIES.	Area of territory in square kilometres.*	Population.
ASIA :

As observed in the foregoing table, Tunis now figures as one of the countries under the protection of France. Notwithstanding the protest of the Sublime Porte, France, after occupying the regency, concluded with Tunis, on May 12, 1881, a treaty comprising the following articles:

* One square kilometre equals 0.386 square mile.

† The population in 1879 was 276,649.

ARTICLE I. The treaties of friendship and commerce existing between France and the regency are confirmed and renewed.

ART. II. With the view to facilitating for the Government of the French Republic the means of guaranteeing the defense of its interests, the Bey's Government accords the Government of the French Republic every facility for assuring the security of the shore and frontiers of the regency by an occupation, the extent and conditions of which will be determined hereafter.

ART. III. This occupation will cease when the Beylic authorities have shown that they can insure the security of the frontiers. The Government of the Republic, on its side, guarantees the Bey's states against all external aggression.

ART. IV. The Government of the French Republic guarantees the execution of existing treaties.

ART. V. The Government of the French Republic is represented at Tunis by a minister resident, who will watch over the execution of the above provisions.

ART. VI. The diplomatic agents of the French Republic at foreign courts will protect Tunisian subjects and defend their interests. In return, the Bey's Government engages not to conclude any international treaty, convention, or act, without first giving notice of it to the Government of the French Republic, and without a previous understanding with it.

ART. VII. The Government of the French Republic and the Bey's Government will arrange the terms of the settlement of the public debt and of the rights of the creditors of the regency. The conditions on which that settlement will be made will be fixed hereafter.

ART. VIII. A war contribution will be paid by the frontier and coast tribes; the amount of the impositions and the mode of recovery will be debated in ulterior negotiations.

ART. IX. In order to protect French interests against the smuggling of arms and ammunition, the Bey's Government engages to prevent all importation of powder and arms.

ART. X. The present treaty will be submitted for the ratification of the President of the French Republic.

Algeria, the most considerable, as it is the most costly, of France's colonial possessions, was under military rule until 1871, but the affairs of the colony are now administered by a civil governor-general, except in the unsettled districts, inhabited for the most part by nomadic tribes. The governor-general is invested with legislative powers in civil affairs, but in all important cases he is advised by a colonial council, established by the home government. The present governor-general is M. Louis Tirman, Councilor of State.

In the French financial estimates for 1882, the revenue of Algeria was set down at 26,990,100 francs, and the expenditure at 29,974,599 francs. The normal monetary status of the colony is a considerable excess of cost over the yield.

The commerce for the year 1879 was of the total value of 391,800,000 francs, of which amount 214,000,000 represented the exports. The values of the exports to and imports from the United States were \$2,128,880 and \$3,562,360 respectively.

In the same year there were 3,013 vessels entered, aggregating 1,127,731 tons; and 3,155 cleared, with a total of 1,154,525 tons. The merchant navy comprised 133 vessels, of an aggregate tonnage of 5,705.

Of railways there were, on January 1, 1881,

1,153 kilometres; and of telegraphs, in 1876, there were 5,588 kilometres, with 9,865 kilometres of wires, including the Algero-Tunisian net-work and the submarine cable. The number of telegraph-offices in 1879 was 163; and that of the dispatches, 803,742.

According to official returns, under date of December 8, 1877, the area and population of Algeria were as follows:

CIVIL DEPARTMENT.

DEPARTMENTS.	Square kilometres.	POPULATION.		
		Males.	Females.	Totals.
Algiers.....	8,268 27	250,229	226,109	455,388

Constantine.....	134,877 49	12,894	714,230	727,124
Totals.....	338,899 45	36,314	1,514,795	1,551,109
Totals of Algeria.	430,000	2,367,626

In October, 1880, the area of the civil department had been extended to 738,388 square kilometres, and the population had increased to 1,884,124. The classification by nationalities, for the entire colony, was as follows: 198,092 French; 33,506 naturalized Jews; 94,038 Spaniards; 26,322 Italians; 14,313 English; 6,513 Germans; 2,748 Swiss; 2,663 Turks; 792 Belgians; and 2,477,641 native Mussulmans.

Both Houses, formally opened on January 11th, instead of the 13th (the statutory opening day), adjourned to the 20th, and on that day proceeded to the election of office-bearers. M. Léon Say was re-elected President of the Senate by 170 votes, or 23 more than he had received when originally appointed in May, 1880. M. Gambetta, elected for the third time President of the Chamber, received 262 votes, against 259 in 1880, and 314 in 1879. On the 21st both Presidents delivered their inaugural addresses. That of M. Gambetta elicited warm applause, and, on the motion of a deputy, was ordered to be placarded throughout France. The following extract from his discourse embodies an interesting review of the labors, past and future, of the Chamber:

The session now opened, the crowning one of this Parliament, will enable you, not without effort, to complete the heavy task imposed on you by the country. Much has still to be done, but you have already done a good deal. On the very morrow of the memorable struggle of May to October, 1877, you inaugurated the execution of the resolution of France. You have put an end to the enterprises of personal rule and of the old parties. You have restored in all its reality the government of the country by the country. You have restored Paris to the Parliament, and the

Parliament to Paris. By a grand act of elenemey and political sagacity* you have drawn a veil over the remains of our civil discords, and that without incurring any peril to republican order. You have favored the efforts that have been directed to national education laws. After restoring in their integrity the too long disregarded rights and laws of the state, you have insured the education of all French youth. By embodying for the first time in the law an absolute respect for liberty of conscience, you have thoroughly remodeled higher and intermediate education, richly endowed the three branches of public instruction, and thereby prepared a splendid crop of men for the future. Public works have received from you a decisive and unprecedented impulse. The populations who had contributed to the creation of the old railways are at length, by a just reciprocity, about to possess new means of transport and exchange. The fine works which France owes to nature and to the past have assumed from your generous co-operation an extension and power which will enable them, from Dunkirk to Marseilles, to compete effectually with the greatest *entrepôts* in Europe. The roads and the canals, largely subsidized and restored, broadened and constructed, will complete that admirable system of means of communication. Alongside the industrial and economic machinery you have taken a jealous interest in reconstructing and refounding the military and naval machinery of France; you have taken a special interest in the men charged on land and at sea with the custody and employment of that vast machinery. The situation, both in active service and as pensioners, of all the officers and soldiers has been improved; that of the non-commissioned officers has been and is still the subject of your constant solicitude. The staff has been reorganized; it remains for you, by passing the bills laid before you, to recast the recruiting law, organize the military administration, fix the rules of advancement, and the belief is warranted that you will not separate without having given the last touch to the great work of national defense. You have been able to accomplish such a programme, thanks to the wonderful industry and thrift of the country, which for five years has annually yielded you in surpluses the large remissions of taxation by which you have lightened each budget. You have set the budgets in equilibrium, devoted large sums to all the public services, and rendered the credit of France beyond all comparisons. A special law of the greatest moment for the different branches of social economy, the total reasting of our general customs tariff, the postal and telegraphic reform, the fusion of these two services, and a long series of business laws will remain a standing proof of your activity and competency. Lastly, while waiting to place by law public liberties beyond reach of attack, you have favored the exercise of them. You have already secured the right of meeting. The press will shortly be set free by your coming deliberations, and also the legal recognition of professional associations. This you have gone through amid profound peace, both at home and abroad. More especially as regards the maintenance of peace abroad, your harmony with the Government and the country has been unbroken. In spite of assertions reposing on no foundation, the whole world knows that the foreign policy of France neither masks secret objects nor adventures. This is a guarantee which resides in the very form of the republican government, in which all depends on the national sovereignty and on a democracy, in the bosom of which external peace, dignified and well sustained, is at once the means and the object of democratic progress. At home this policy, these reforms, these results, and these hopes will enable you to submit yourselves with confidence to the judgment of the country. Since you began to occupy these seats, several times and in divers ways the nation has had occasion to pronounce itself

* Allusion to the decree of July 11, 1880, granting plenary amnesty to the insurgents of the Commune.

on your acts. It has always afforded them a rigorous sanction, and it is not immediately after the magnificent elections which have just taken place for the municipalities that your entire community of ideas and principles with universal suffrage can be contested.

On February 6th the Chamber disposed of the Press Bill, subject to a second reading, provisions punishing seditious crimes, obscure articles or illustrations, defamation and insults to foreign sovereigns or ambassadors having been agreed to. A clause proposing the visitation of insults to the republic with from three to twelve months' imprisonment was, after prolonged discussion, rejected by 287 votes to 187, on the ground that the republic was "strong enough to defy insults." On the 15th the stipulation was agreed to (by 253 votes to 222) that "no foreign journal shall be excluded from France except by decision of a Cabinet council."

On February 7th the Chamber went on with M. Naquet's Divorce Bill, the discussion of which was awaited and followed with intense anxiety and interest. Divorce, expunged from the *code civile* by the religious reaction of 1816, has ever since been replaced in France by an old law restored, allowing only judicial separation (*séparation de corps*). M. Léon Renault, reporter to the committee, vindicated the measure as a revival, not of the law of 1792, which he disapproved, but that of 1803. It restricted divorce, when desired by but one of the consorts, to cases of adultery, maltreatment, or insult, and condemnation to degrading punishments; while divorce by mutual consent was by it subjected to various conditions, such as the acquiescence of the children, the assignment to them of one half the property, etc. As a compromise with traditional scruples, it proposed the indissolubility of the second marriage of divorced persons, and admitted judicial separation as still obtainable. M. Renault urged in behalf of the new measure that divorce, far from favoring heedless marriages, would strengthen tottering unions, while the marriage of the adulterous would be forbidden; and that judicial separations were increasing in France more rapidly than divorces in other countries, the rate of the former being nine per 1,000 marriages, and that of the latter but four per 1,000.

An amendment modifying the system of judicial separation was combated by M. Naquet himself. M. Cazot, Minister of Justice, said that religious considerations were foreign to the debate, and that scrupulous Catholics might still have recourse to *séparation de corps*; that divorce would do away with forced celibacy, diminish the number of illegitimate offspring, and encourage the creation of new families; that the question at issue was whether certain exceptional circumstances ought not to be sacrificed to the preservation of the institution of marriage—the key-stone of social existence; that matrimony was no ordinary contract, but one which, though founded on the free-will of

the parties, when once entered into became indissoluble; and that permanence was what the parties had in view when taking the marriage vow, nor would any one have then thought of divorce but for M. Naquet's project, which, if sanctioned, would determine a marked increase of improvident unions, bearing in them the germs of corruption and dissolution, and discourage tolerance and reciprocal concessions in existing marriages. The clause repealing the law of 1816 was rejected by 261 votes to 225, and the reform of the judicial separation system left as the only possible modification of the present state of things.

The result of the municipal elections in January was favorable to the republicans.

Early in the same month were announced further incursions of Tunisian tribes in Algeria, which the Bey was powerless to prevent; and in April the hostile movements of the Kroumirs against the French troops determined the appropriation of 5,695,000 francs for an expedition, of which General Forgemol was appointed commander. On the 20th M. Roustan, the French Consul-General in Tunis, informed the Bey that he would be held responsible for any effusion of blood that might occur; the Island of Tabarca was occupied by the French troops on the 21st, and on the 25th the military operations commenced against the Kroumirs. The suzerainty of the Porte over Tunis was asserted in a note addressed by the Turkish ambassador to the French Government; and on May 9th a circular was issued by the Minister of Foreign Affairs, declaring that the only object of the Tunisian expedition was to insure the safety of Algeria.

On the 15th M. Jules Ferry announced to the Chamber the "happy diplomatic settlement of the Tunisian question," and expressed the hope that the treaty* concluded with the Bey would be regarded as "securing legitimate interests without exceeding the limits of justice and moderation." Toward the end of the month the operations against the Kroumirs terminated successfully; but the insurrection of the Algerian tribes, one of which was ably commanded by Bou-Amena, seemed to foreshadow further troubles. An additional appropriation of 14,000,000 francs for the Tunisian expedition was asked for by the Minister of War on June 9th, and voted July 9th. On the 19th Marseilles was the scene of a disturbance growing out of a quarrel, with the Italian residents, about the French policy in Tunis.

The defeat of the *scrutin de liste*† bill (rejected June 9th by 148 votes to 114), and, in the August elections, his ill success in his own Belleville constituency, of which, though ill requited, he has ever been the dauntless champion, were grave rebuffs to M. Gambetta,‡ whose supineness and embarrassment as premier after November 14th filled France and the world with surprise.

* For the text of this treaty, see page 309.

† See *SCRUTIN DE LISTE*, p. 307.

‡ See *GAMBETTA*, Léon Michel, p. 313.

FRIENDS. The later statistical reports of several yearly meetings of the Society of Friends indicate a small gradual increase of members. The London yearly meeting, which had been declining for fifty years, has within a few years past been receiving accessions; and its reports for 1881 indicated an increase during the year of 106 members, the whole number being 14,981. The reports of the Indiana yearly meeting showed an increase of 1,000 members during the year, and a total of 19,342 members. This increase is not, however, observed in all the yearly meetings, some of which still appear to be falling back or stationary. Thus, the Philadelphia yearly meeting had only 5,650 members in 1881 against 6,000 in 1871, and the New England yearly meeting 4,399 in 1881 against 4,403 in 1871. The mission at Matamoras, Mexico, returned 204 members. Its converts were preaching effectively at several places. A series of school-books published by the mission has gained a large circulation throughout the country.

Among the marked features in the recent history of the Society of Friends are the development of a tendency among individual members to conformity with the usages of other denominations, and to occasional participation in their religious exercises, and the toleration which has been accorded to it in some of the yearly meetings. The singing of hymns has been permitted in Friends' meetings; ministers of the society have preached in the pulpits of other denominations; and an English Friend of sufficient prominence to make his case conspicuous has been baptized without provoking any adverse action from the monthly meeting with which he was connected. A suit which was brought in the State of Indiana for the control of the property of the society, and of a legacy which had been left it, involved the question of the legality of departures of this character. The points wherein the "Progressive" party, who brought the suit, differ from the Orthodox party, or adherents of the old order, were defined in the pleadings as follows: The Progressive party deny that Christians should await the influence of the Holy Spirit in conducting religious services, but claim that they should be governed by fixed purposes, or a sense of duty, in such matters; they deny that men have an inward light, such as the light of Christ, till after conversion; they teach that Christ had a human and a divine nature, and that the divine nature or God-head died on the cross; that the material bodies of the redeemed will be raised; that it is no longer necessary to continue the peculiar habit, dress, address, and forms of worship of the Friends; they hold protracted meetings by prearrangement, and call publicly on persons to speak, or pray, or relate their Christian experience, ask the unconverted to make confession of their sins, setting seats apart for them, and have singing; their Sunday-schools are formally opened and closed, and vocal and

instrumental music is used in them; they hold that marriage is a civil ordinance, and that ministers may marry persons without reference to the inquiry or consent of the society; that ministers should be regularly assigned to the ministry, and money should be systematically collected for their support; they do not discourage the use of titles of address in connection with the names of persons; and their funerals are conducted with reading from the Scriptures, singing, and a discourse from a special text.

In the case referred to, the plaintiffs held that they represented the original and regular quarterly meeting, and that it was recognized as such by the Western yearly meeting, with which it was connected, and which was in orderly communication, according to the custom of the society, with all the other yearly meetings; therefore they were, according to the Friends' custom, a branch of the society in good standing, notwithstanding their alleged departures from the old usage, and, as such, legitimately entitled to the possession of the property they claimed. The defendants, the plaintiffs maintained, who had separated from the quarterly meeting and from the Western yearly meeting on account of their toleration of departures from ancient Friends' usage, and had formed a new quarterly meeting and a new yearly meeting, were not entitled to be recognized as representatives of regular organizations, notwithstanding their adherence to the ancient usage, because they had not received the recognition which was accorded to the bodies of which the plaintiffs were representative, in correspondence with the other yearly meetings. The court held, in answer to an argument on demurrer in which these allegations were set forth, that the highest church organization must decide whether there has been departure in doctrines, and, until the superior organization has so determined, the civil court can not enter upon an investigation of that question; that no organization can be recognized by the civil courts as legal and valid, whether a yearly, quarterly, or monthly meeting, which has not been recognized in accordance with the rules and usages of the Church as having been regularly established. By the averments of the papers as presented in the proceedings, it appeared, in effect, that all the yearly meetings throughout the world hold control over the establishment of each proposed new yearly meeting, not like the Presbyterian Church, through a General Assembly, or, like the Methodist Church, through a quadrennial General Conference, but through correspondence of recognized officers of each yearly meeting, the means only being different, but the end accomplished, so far as the present inquiry is concerned, being the same. Applying these principles to the facts stated in the answer, the subject of inquiry in the case was narrowed down practically to the recognized legitimacy of succession of each of the two

ENG. BY E. B. B. & CO. N. Y.

Louis Cambetta

L. APP. 1880. 6. 10.

contending societies, each of which claimed to be the White Lick quarterly meeting of Friends. If those who had withdrawn from the Western yearly meeting to form a new yearly meeting had never been recognized in accordance with the usages of the Society of Friends as a regularly and properly organized yearly meeting, they had no rights, powers, or authority which the civil courts could recognize as such; and if, as was also alleged, the defendant society had never been recognized by the established Western yearly meeting, within whose territorial jurisdiction they seemed to have attempted to organize, as properly organized, then they had no rights as such organization which the civil courts could protect or enforce. It might appear to the court or jury that the recognized Western yearly meeting, or the recognized White Lick quarterly meeting, had utterly abandoned the ancient faith and practices, doctrines and teachings of the Society of Friends; yet when the superior organizations have decided otherwise, when they continued to recognize and fellowship these organizations, notwithstanding such apparent change, as regular and orthodox, and refused to recognize or admit to fellowship the new organization which might appear to adhere strictly and tenaciously to such ancient faith and practices, courts and juries must respect their action, and in the judgment of the court could not go behind it.

Issue was afterward joined upon the questions of facts involved in the suit.

FUSION DISK. A simple apparatus has

been invented by Jacob Reese, of Pittsburg, which is found very useful in its industrial applications, while the principle of its action is a puzzling problem to scientific men. It is a circular, revolving saw, with which steel bars are cut in two. The material of the circular saw is soft iron. It fuses steel bars which are brought into close proximity to it without touching. The bar to be cut is made likewise to revolve, in the contrary direction, with a speed of 200 revolutions a minute. The revolving disk is 42 inches in diameter and $\frac{1}{4}$ inch thick. It turns with a velocity of 2,300 revolutions, equal to a tangential velocity of 25,250 feet a minute. The circular disk is mounted on an arbor and set in motion with pulleys and belts, like an ordinary circular saw. When the bar is brought almost into contact with the revolving disk, a small drop of molten metal first appears on its surface. In a few seconds a notch is made, the molten metal flowing downward in a stream of sparks, and being thrown in sparks in all directions. A singular circumstance is the fact that the incandescence sparks, when they first leave the bar, are not hot. These sparks or drops of fused metal are of dazzling whiteness, yet their temperature differs but little from that of the surrounding atmosphere. In their path through the air those sparks which are projected sideways acquire heat from the friction. At the distance of five feet or more they burn like a red-hot poker, while their vivid incandescence has given place to a dull-red color.

G

GAMBETTA, LÉON MICHEL, a French statesman, born April 3, 1838, at Cahors, where his father, a Genoese of Jewish origin, was engaged in commercial pursuits. After attaining high honors at the lyceum of his native town, he studied law in Paris, and was there admitted to the bar in his twenty-second year. For some time secretary to the late M. Crémieux, the young advocate's talents soon won for him the admiration and friendship of the veteran democrat, in whom he afterward found a firm supporter. During the interval between 1859 and 1868 he gained notice and distinction both as an eloquent forensic orator and as a writer, alternately pleading the causes of political offenders (mostly journalists), publishing essays on eminent members of the Paris bar, and contributing to the daily press articles on politics, finance, art, and other topics. In the electoral campaign of 1863, the first in which he took an active part, he acquired considerable popularity as an ultra-Liberal. But 1868 found him popular and left him famous. The empire, which sprang from the *coup d'état* of December 2, 1851, and silenced for a time the nation's voice, had now become an impossible thing.

The luster of a period marked by military successes in the Crimean and Italian Wars, and efficient to repress but not subdue the opposition, had been dimmed by the sorry issue of the Mexican expedition, and the disastrous Treaty of Prague; both indicative of the enfeeblement, or, as it has been aptly termed, the precocious dotage, of the head of the dynasty. Public discontent was at the full, and the people looked forward to a solution not long to be deferred, and already foreshadowed in overt democratic demonstrations of hostility to the Government. As an instance of such manifestations, we may cite the popular tribute to the memory of Deputy Baudin, the circumstances of whose death while endeavoring to shield the people from the fury of the troops on December 2, 1851, had been vividly recalled in a recent publication on the *coup d'état*. Numerous arrests followed; the press protested, and a subscription for a monument to Baudin was opened in the columns of "Le Réveil." Delescluze, the editor-in-chief of that journal, was prosecuted, and Gambetta called to his defense. In his speech on that occasion (November 14, 1868), the cause of

"Le Réveil" was to some extent overlooked, doubtless by design; but the authors of December 2d were lashed unsparingly in a torrent of eloquence unparalleled for impetuosity and daring since the days of Mirabeau:

Why talk here of *plébiscites* and ratifying clauses? A specious argument, in sooth, to draw from article 133§ of the civil code, and drag to this gloomy domain where it was little expected! Ah! you are not content with five million votes! After a reign of seventeen years, you perceive that it would be well to prohibit the discussion of your deeds by means of a posthumous ratification emanating from a criminal court! No; it shall not be. No; you shall not, you can not have that satisfaction. For such a cause there exists no court of appeals. It has been judged already, yesterday; it will be judged to-morrow, and the day after, and for ever, until justice shall have received her supreme satisfaction. The cause of December 2d, do what you may, will survive indelible in Paris, in London, in Berlin, in New York, and the verdict of the human conscience everywhere will be the same. But our adversaries have, besides, another accuser. Harken: For seventeen years you have been the absolute masters of France. We would not ask what use you have made of her treasures, her blood, her honor, her glory; nor speak of her integrity jeopardized, or of what has become of the fruits of her industry: for no one needs to be told of the financial catastrophes now, at this very moment, springing as mines beneath our feet. Your most relentless accuser, because it is the attestation of your own remorse, is the fact that you have never dared to say, "We will celebrate, we will add to the list of solemnities in France, the 2d of December, as a national anniversary!" Yet each successive *régime* in our country has so honored the day of its birth. July 14th and August 10th have had their *fêtes*; and the days of July, 1830, and February 24th, in like manner. Two anniversaries only—the 18th Brumaire and 2d of December—have never been included among the solemnities of accession; for you know that the nation could not in conscience sanction them. Hear, then! that anniversary, which you have neglected, we will take for ourselves; we will celebrate it year after year; and it shall be the anniversary of our dead, until the day when the nation, once more in possession of her sovereignty, shall visit upon you the great national expiation in the name of Liberty, Equality, and Fraternity.

Rather than a defense of Delescluze, there was here an indictment of Caesarism, and the knell of the second empire; for the structure, still so brilliant without, must be decayed within and tottering to ruin, when the very judges whose first duty it was to silence the seditious orator, heard him, as if spell-bound, to the end. Unanimous acclamations of the Liberals throughout France signified the adhesion of that party to the young advocate, thenceforward one of its chieftains. During the ensuing six months he won new laurels, in the defense of the "Progrès du Nord," at Lille, and of the "Émancipation," at Toulouse. In the general elections of 1869, M. Gambetta was presented as a Republican candidate to the Legislative Assembly for Belleville (first electoral district of Paris) and Marseilles, he announcing that he would accept no mission but that of an *opposition irréconciliable*. He was elected in both districts by an immense majority, the rival candidate for the first being M. Carnot, one of the favorite names of the democ-

racy, but twice the age of Gambetta; and those for the second, such men as Thiers, the civil engineer Ferdinand de Lesseps, and the Marquis de Barthélemy. He chose to sit for Marseilles, and took his place on the Extreme Left. After an absence of several months, occasioned by a severe throat affection brought on by the fatigues of an arduous electoral campaign, he returned to the Corps Législatif and made a series of remarkable speeches, especially one in which he protested (February 7, 1870) with indignation against the arrest of his colleague Henri de Rochefort, deputy-elect for Belleville in the place of Gambetta; and more particularly the memorable one in which (April 5th) he denounced the *plébiscitum* as unconstitutional; juridically reviewed the value, essence, and economy of the various political systems; and, pointing out why the republican system ought to be preferred, seemed to invite that avowed anti-republican assembly to make the trial. It was no small triumph to be heard on such a theme for the space of three hours, with admiration and almost without interruption, by a House notoriously hostile no less to the person than to the ideas of the speaker. He could charm, but not persuade. But events already in preparation would soon place him in a sphere of action with the difficulties of which only abilities of a superior order, united to an indomitable energy and marvelous activity, could cope.

M. Gambetta's opposition to the war with Prussia was at first more measured than that of many of his colleagues; so much so, that he refused to seek, in the embarrassments to the Government consequent upon the early disasters of the campaign, a favorable opportunity for revolutionary movements. After the capitulation at Sedan, however, hesitancy gave place to decision: the republic was now to be established, and he joined the ranks of its zealous promoters. On September 3d he signed, as member of the Provisional Government of the National Defense, Jules Favre's proposition declaring the Napoleonic dynasty deposed; the next day saw him in possession of the portfolio of the Interior; and on the 7th he signed the convocation of the electoral colleges for the 18th* of October, for the purpose of appointing a Constituent Assembly. The new Minister of the Interior remained but a short time at Paris. His colleagues counting, and with reason, upon his energy and the magic power of his eloquence to rouse the inhabitants of the provinces against the invader, and meet the cruel necessities of the hour, he was attached, by decree of October 7th, to the delegation (Crémieux, Glais-Bizoin, and Fourichon) already sent to Tours, and whose tardiness in the organization of the national defense in that region was a source of anxiety to the Central Government. He set out from the capital in a balloon on the 8th of October, and, reaching Tours on

* On the 16th, an earlier date, October 2d, was fixed upon; but the elections were in the event postponed indefinitely.

the 9th, issued proclamations appealing to the patriotism of the inhabitants in terms so earnest and irresistible as to produce a profound impression throughout the departments. Combining in his own direction the cumbrous functions of three ministries—Interior, War, and Finance—his energy presided in all branches of the public service, in the Cabinet and on the battle-field; now at Orleans, Lille, or Lyons; again at Tours, or, after December 7th, at Bordeaux—wherever there were measures to be concerted, discouragement to be dispelled, disorders to be repressed, armies to be organized, or even military operations to be planned. Thus Gambetta, vigorously seconded by M. de Freycinet, maintained his authority for a period of nearly four months, in the midst of the situation here briefly sketched. In a word, he was dictator by force of circumstances. True, this dictatorship has been rudely criticised by some, and sneered at as the *dictature de l'incapacité*; but such harsh reflections on the "inutility and impotence of the dictator's impetuous efforts" did not find utterance until near the end. Among the acts and speeches pertaining to that period, French biographers cite the decree for the mobilization of the National Guards, at the expense of the respective departments; the proclamation containing the announcement to France of the surrender of Metz, and the denunciation of Bazaine as a traitor—the loan of 250,000,000 francs negotiated with British capitalists; the dissolution of the Councils-General elected under pressure of the imperial administration; the successive organization of the two Armies of the Loire under Generals Aurelle de Paladines and Chanzy; the organization of the Army of the North, commanded in turn by Generals Bourbaki and Faidherbe; the disastrous issue of the campaign of the east (under Bourbaki), hastened by the armistice, and the removal from office of such members (even life-members) of the magistracy as had taken part in the mixed committees in 1852. After the surrender of Paris, which he spoke of as an act of *culpable haste*, he issued the convocation of electors for the National Assembly, but stipulating the ineligibility of such persons as had been candidates for or had held office under the empire. The Central Government, however, annulled that stipulation, and, on Gambetta's refusal to comply, dispatched one of its members, Jules Simon, to Bordeaux, with orders to execute the decree as at first drawn up. On this, M. Gambetta resigned all his functions, and withdrew from a government with which he was now in open disagreement. The elections of February 8, 1871, afforded abundant proof of the continued prestige of his name. He was spontaneously proposed as candidate in a number of departments, and elected in nine, among these being that of Bas-Rhin, for which he chose to sit, as a protest against all measures entailing the dismemberment of France, although the cession of that province to the German Em-

pire would deprive him of his seat in the Chamber. At the complementary elections of July 2d, he was returned by three departments, and gave his option this time for Paris. He took his place at the Extreme Left, became a member, and was chosen President of the *Union Républicaine*. During the turbulent period of the Commune, and before the July elections, M. Gambetta had spent a brief vacation at San Sebastian, in Spain. After his return he was for a long time seldom seen at the Chamber, the Extreme Right being then in majority. And later, when he again took part in the debates, his attitude was uniformly conciliatory, spite of incessant and petulant attacks on the part of his colleagues of September 4th, and to which he had decided never to reply. On more than one occasion he prevailed upon his party to sustain the government of Thiers, notwithstanding the latter had frequently assailed him in parliamentary discourses; but once he left Thiers to support the candidature of M. Barodet against that of M. de Rémusat. In 1871 and 1872 it was usual to see Gambetta's name associated with the preparation of a government party in the republic, with its Whigs under Gambetta and its Tories under Thiers. The year 1872 was marked by two notable speeches from the leader of the Left. In one of these, on the anniversary of the taking of the Bastille (July 14th), he dwelt on the necessity of reconstituting the union of the middle classes, of adopting secular and compulsory instruction, universal military service, and a policy of conciliation, crowned by an amnesty without restriction. In the other, delivered at a private reunion, he referred to the advent of a "*new social stratum*, by no means inferior to its predecessors." The theme of this latter speech and its tone of hostility to the existing administration alarmed the public mind in the south, and provoked the open resentment of the Government. His most important speech in 1873 was one against the Septennate (November 19th). On June 9, 1874, he interpellated the De Fourtou Ministry concerning Bonapartist intrigues, and M. Rouher, in the course of his reply, having touched upon the revolution of September 4th, Gambetta retorted: "There are certain men to whom I deny the right and privilege to arraign the revolution of September 4th—I mean the wretches who have been the ruin of France." On being called to order, he added, "My expression undoubtedly implies more than an outrage—it implies a brand of dishonor, and I maintain it."

In the course of the winter of 1874-75, for the most part occupied in the task of effecting a union between the several subdivisions of the Left and the Right Center, with a view to the adoption of the constitutional laws, M. Gambetta delivered one of his most effective and most finished speeches (February 12, 1875). From that day forward the so-called policy of "opportunism" has been the distinctive policy of the entire Left, save the

small groups of *Intransigeants*, then headed by Louis Blanc and Alfred Naquet. Throughout the remainder of 1875, Gambetta was the most formidable adversary of the Buffet Cabinet, though without any departure from those principles of conciliation embodied in his own maxim, "Moderation is the true course in politics." In the ensuing senatorial elections, his influence preponderated, as usual; and in those for the Chamber he busied himself, besides his own candidatures (Paris, Lille, Marseilles, Bordeaux, and Avignon), in suggesting or ratifying the choice of other candidates in the several departments.

In an address to his constituents of Belleville he found occasion to explain the philosophy of his political creed: "I deny the absolute in all things, so you may well imagine that I will not admit it in politics. I am of a school that believes only in relation, analysis, and observation, the examination of facts, the comparison and combination of ideas; a school that takes into account mediums, races, tendencies, prejudices, and antagonisms. Politics are not, nor can they be, always the same." As the acknowledged leader of the Republican majority in the new Chamber he again essayed, but in vain, to accomplish the unification of the Left; and combated clericalism, denouncing pulpit interference in electoral concerns.

The position of President of the Budget Committee (April 5, 1876) offered him an opportunity for the introduction of needed reforms. But the preparation of his vast financial schemes for the future, and in which he revealed surprising skill, did not prevent him from following up the *politique opportuniste*, on which he had staked his name and parliamentary success. Thus he supported M. Margue's proposition of amnesty by categories against M. Raspail, the advocate of universal amnesty; adopted the bill for reducing the period of service in the army to two years; protested energetically against the attacks leveled at him from the rostrum and through the press by a certain group of *Intransigeants*; and reiterated his decisions in favor of amnesty by categories, stigmatizing "those disreputable men who had sought to turn the Commune's despair to their own advantage." On January 28, 1877, he was re-elected President of the Budget Committee.

M. Jules Simon, appointed Premier and Minister of the Interior in December, 1876, was early assailed by the Bonapartists and the prelates; but Gambetta's preponderant influence was such that he obtained the passage by the Chamber of a resolution requesting the Government "to use all the legal means at its disposal to repress the anti-patriotic agitation." Some time afterward, in a famous speech before his Belleville constituents, he exclaimed, at the close of a vehement tirade against the Church party, and referring to the concluding words of his address to the House in behalf of Jules Simon: "Yesterday we said, 'Clericalism—

there is the enemy!' to-morrow we must be able to say, 'Clericalism—behold the vanquished!'" Yet the Premier had another enemy behind the Churchmen. M. Simon was the genuine representative of Thiers in the Government, and MacMahon regarded his presence in the Council as a check upon his own movements, and the Marshal-President preferred to be surrounded by men willing to adopt his mode of thinking. More than all this, there existed a strong personal animosity between the two men, which was not likely to be diminished by the recollection of the disparaging if not contemptuous terms in which Simon had spoken of MacMahon, when the reelection of the latter had been proposed. On May 16th the Premier received a note of dismissal from the President, who assigned as the reason for such a sudden determination the attitude of the Cabinet in the debate on the press law the day previous, when, by the immense majority of 398 to 56, the House resolved to abrogate the law passed by the reactionary Assembly of 1875. Gambetta protested, and the resolution was adopted that "the Chamber, considering that it is of importance in the present crisis, and with a view to the fulfillment of the mission which it has received from the country, to remember that the preponderance of the parliamentary power, exercising itself through the ministerial responsibility, is the first condition of the government of the country by the country, declares that confidence of the majority can not be obtained except for a Cabinet free in its action, and resolved to govern according to those republican principles which alone can guarantee order and prosperity at home and peace abroad."

M. Gambetta thenceforward concentrated all his forces on the one grand object of forcing the Marshal-President to resign, and triumphed in the end, though he himself did not pass unscathed through the struggle. The time had come to precipitate the overthrow of an administration now grown obnoxious to all parties, save the two which were themselves most obnoxious to the majority of the French people and to republicanism. Division had been extinguished in the republican ranks, and Gambetta held the command more firmly than ever. To add to the unpopularity of the Government, Jules Simon and his ministers had been succeeded by the Broglie-De Fourtou Cabinet, called by Gambetta a "government of priests." In the ensuing electoral campaign, the ubiquitous orator kept the public mind vividly impressed with the real interests at stake, reiterating at every stage of the crisis his protest against personal *régime*. "When France makes her sovereign voice heard," he cried, in his speech of August 15th, at Lille, and pointedly alluding to the Marshal-President, "he must quit or submit (*il faudra se soumettre ou se démettre*)." For his temerity he was sentenced to three months' imprisonment, and fined two thousand francs; but the event proved the

words to have been prophetic, and showed how well the speaker knew the power behind him.

Another prosecution incurred by similar language, in a later speech to the electors of the twentieth arrondissement of Paris, seemed but to goad him to the attack, which he only relinquished as victor. A brief but fierce conflict between the President and the Chamber; the downfall of the Broglie-De Fourtou and the accession of the Dufaure or Parliamentary Ministry (December); Gambetta's visit to Italy and his conferences with Italian statesmen, keenly piquing public curiosity; his angry encounter with De Fourtou, and the resulting duel (November 18, 1878), and Gambetta's refusal of a proffered portfolio—such were about the only remaining events of importance relating to our subject, until the resignation of President MacMahon (January 5, 1879). On January 30th, Gambetta accepted the presidency of the Legislative Assembly under the Grévy administration, having been elected by an almost unanimous vote to that position, which he quitted for that of Premier on November 14, 1881. The history of his public life since January, 1878, including his triumphant support of the plenary amnesty bill, carried (June 21, 1880) by 333 against 140 votes, as the result of the first oration he had delivered from the tribune of the Palais-Bourbon since the somber days of the revolution of September 4, 1870; the defeat of his cherished electoral reform bill for the *scrutin de liste*, etc., is in form and in fact the history of the Corps Législatif itself, and reference therefor may be made to the article FRANCE, in our volumes for 1878, '79, '80, and the present one.

GARFIELD, JAMES ABRAM, twentieth President of the United States, born at Orange, Cuyahoga County, Ohio, November 19, 1831; died at Long Branch, New Jersey, September 19, 1881. (For particulars of his life down to his election to the office of President, see "Annual Cyclopædia" for 1880.) In the interval between his election and his inauguration on the 4th of March, with the exception of a brief visit to Washington on private business in November, he continued to reside at Mentor, Ohio, where he was visited by many public men, some of whom came on his special invitation. The composition of his Cabinet, and his general purposes in regard to public appointments, were the subject of constant speculation, and in consulting the political leaders of his party he manifested a desire to unite them all in support of his Administration. It was early understood that Senator Blaine, of Maine, who had been one of the chief competitors for the nomination at Chicago, was to be Secretary of State. Among those summoned to Mentor for consultation was Senator Conkling, who had led the delegates in the convention pledged to the nomination of General Grant; and it was given out that Secretary Sherman, who had been the other leading candidate for the nomination, could retain his

place at the head of the Treasury, if he desired to do so. The President-elect took leave of his friends and neighbors on the last day of February, and arrived at the capital on the 1st of March. The inauguration on the 4th was attended with unusual civic, military, and social display, and there was a general feeling of hopefulness and confidence in the new Administration. The Senate met in special session, and on the 5th the Cabinet appointments were submitted and promptly confirmed. Mr. Blaine appeared at the head of the list, as was expected; Secretary Sherman had preferred a re-election to the Senate; and the influence of Mr. Conkling was not noticeable in the make-up of the Cabinet. The Senate was in session until the 20th of May, but the time was mostly taken up with a controversy over its organization, and it was not until May 4th that executive sittings were held to act on other nominations. On the 22d of March several names were sent in for offices in the State of New York, including those of district attorneys and marshals, and the Collector of the Port of Buffalo. The appointees were supposed to be entirely acceptable to the Senators from that State. On the day following Judge William H. Robertson was named as Collector of the Port of New York, the incumbent of the office, E. A. Merritt, being appointed consul-general at London. These appointments were known to be displeasing to Senator Conkling, and provoked considerable discussion. When the Senate finally went into executive session, Mr. Conkling declared his opposition to the appointment of Mr. Robertson, claiming that he had a right to be consulted in the matter, and that the selection of a conspicuous political enemy of his for so important an office in his own State was an insult, and in violation of pledges given him by the President. Finding that the New York Senators were determined, if possible, to defeat the confirmation of Robertson and Merritt, the President withdrew all the other appointments for that State in order that their cases might be acted on alone. Seeing that they could not prevent the confirmation, Senators Conkling and Platt both resigned on the 16th of May, and returned to New York to seek a vindication of their course by an immediate re-election. Robertson and Merritt were then confirmed, and the other New York appointments renewed, a change being made in that for Collector of Buffalo. Out of this controversy grew considerable factional excitement between what were known as the "Stalwart" and the "Administration" wings of the Republican party.

On the morning of July 2d, the President set out from the Executive Mansion with Secretary Blaine for the Baltimore and Potomac Railroad station, where he was to join several members of the Cabinet for a trip to New York and New England, including visits to Williams College and the White Mountains.

The two entered the station arm in arm, and while they were passing through the ladies' waiting-room two pistol-shots were heard in quick succession, one of which took effect in the President's back. He sank to the floor, bleeding profusely, and for a moment was unconscious, and then was affected with vomiting. To get him out of the confusion he was carried to the offices of the company, on the second floor. Several physicians were summoned, and, after a superficial examination of the wound, the President was taken back to the Executive Mansion. His wife was summoned from Long Branch, whence she was to have joined him on his Eastern trip. Among the physicians first summoned was D. W. Bliss, an old friend of Garfield, for whom Secretary Lincoln had sent his carriage, and, at the request of the President, he took charge of the case. With the acquiescence of Mrs. Garfield, he selected Drs. J. K. Barnes, Surgeon-General of the Army, J. J. Woodward, also of the army, and Robert Reyburn, as his assistants. The result of their first careful examination was the opinion that the bullet had penetrated or grazed the liver, and had lodged in the front wall of the abdomen. They believed that the injury was not necessarily fatal, but concluded that it was not advisable to attempt the removal of the bullet. On the evening of July 3d it was decided to call in Drs. D. Hayes Agnew, of Philadelphia, and Frank H. Hamilton, of New York, for consultation and advice. They approved of what had been done, acquiesced in the opinion of the other physicians as to the course of the bullet, the inadvisability of attempting to extract it, and the chance of recovery.

The person who had fired the pistol at the railroad-station had been promptly seized and taken into custody. He proved to be Charles J. Guiteau, who had been a persistent but unsuccessful applicant for an appointment, first as minister to Austria, and then as consul-general to Paris. He describes himself as a lawyer, a politician, and a theologian, and is reported to have said, on being taken into custody: "All right, I did it, and will go to jail for it. I am a Stalwart, and Arthur will be President." A letter was found on his person in which the death of the President was spoken of as a "sad necessity" that would "unite the Republican party and save the republic." Guiteau was lodged in the District of Columbia jail, to await the result of the President's wound.

The news of the attempted assassination created intense excitement throughout the country, and it was considered in some quarters as an indirect result of the political system that encouraged unregulated office-seeking and occasioned many disappointments, and to the quarrel between the so-called "Stalwarts" and Administration Republicans, which had originated in the controversy over appointments in the State of New York. There was an al-

most universal outbreak of sorrow and indignation at the crime, and sympathy for the sufferer and his family, and this found expression in the action of numerous public bodies and political assemblies, of both parties and in all sections of the country. It extended to foreign lands, and brought forth many official and unofficial expressions of sympathy. After the first shock had passed, the announcement that the wound was not necessarily fatal, and that there was a chance of recovery, gave rise to a hopeful feeling, which increased with daily reports of favorable progress. As early as the 10th of July Governor Foster, of Ohio, suggested to the Governors of all the States the appointment of a general day of thanksgiving for the President's escape from death, and the prospect of his speedy recovery. In several States this suggestion was acted on. The favorable reports continued for some days, and the President's recovery was confidently predicted by the surgeons in attendance. They concluded that no important organ had been injured, and that the bullet was likely to become encysted and harmless, or might possibly declare its presence in a way that would admit of its successful removal. The first check in the favorable symptoms was on the 18th of July, and was followed by an apparent resumption of progress. The first serious relapse occurred on the 23d of July, being attended with chills and more or less of fever. The bullet had entered between the eleventh and twelfth ribs about four inches to the right of the spinal column, the assassin standing about six feet behind and a little to the right of his victim, and the bones had been somewhat splintered. The diagnosis assumed that there had been a deflection which sent the bullet downward and to the right. The probing and treatment of the wound had followed this supposed course, where there was by this time a channel several inches in depth. The unfavorable symptoms were caused by obstruction in the flow of pus, and on the morning of the 24th an incision was made by Dr. Agnew to give a freer passage from the supposed track of the wound. This was followed by relief and a resumption of hopeful reports. On the 28th there was a slight recurrence of fever, and day by day thereafter there was more or less of febrile rise in the temperature and pulse, attended with abnormal respiration.

The heat of the season aggravated the difficulty of dealing with the case, and artificial means of cooling the atmosphere of the Executive Mansion were resorted to. Large quantities of ice were placed in the cellar, over which air was passed and then admitted to the sick-room by means of an apparatus specially devised for the purpose. The case was also believed to be more or less complicated by malarial influences prevailing in and about the White House. Besides the physicians already mentioned, there were in constant attendance on the President his intimate friends Colonel

A. F. Rockwell and General Swaim, and Mrs. Dr. Edson, the family physician of Mrs. Garfield; Dr. Boynton, the President's cousin and former physician, was also a careful and solicitous watcher. Experiments were made for locating the bullet by means of the induction balance under the direction of Professor Graham Bell and an assistant, the result of which was announced, as follows, in one of the medical bulletins of August 1st:

Under the supervision of the attending surgeons, Professors Bell and Taintor this morning made another application to the patient's body of the electrical apparatus known as the induction balance, with a view to completing the tests of last week, which were not entirely conclusive, and ascertaining definitely and certainly, if possible, the location of the ball. Professors Bell and Taintor have been almost constantly engaged for two weeks in experiments with the induction balance, and have made several modifications and improvements which greatly add to its efficiency. They tried this improved apparatus upon the President's body for the first time last week, and although it indicated faintly the location of the ball, it was afterward found to be slightly out of adjustment, and the experiment was not regarded as perfectly conclusive. The results of this morning's tests, however, are entirely satisfactory both to Professors Bell and Taintor and to the attending surgeons, and it is now unanimously agreed that the location of the ball has been ascertained with reasonable certainty, and that it lies, as heretofore stated, in the front wall of the abdomen, immediately over the groin, about five inches below and to the right of the navel.

Favorable reports continued during the first days of August, and plans were discussed for removing the patient to the Soldiers' Home. On the 6th unfavorable symptoms were reported as the effect of the heat, and on the following day they were declared to be more serious, and attributed to further obstruction of pus in the wound. A new incision was made, this time below the rib, giving another and freer outlet from the assumed track of the wound. Relief and renewed progress were announced as the result, but there seemed to be no satisfactory evidence of healing. On the 10th the President, for the first time since the shooting, signed an official document, presented for the purpose by the Secretary of State, being one of the papers in an extradition case pending with Canada. About this time there was considerable discussion as to the correctness of the medical treatment, and also as to the propriety of leaving the executive department of the Government without an active head, some maintaining that the exigency existed under which the Constitution provided for the devolving of the powers and duties of the presidential office on the Vice-President on account of "inability." After the 10th of August the reports from the sufferer were less hopeful, and unfavorable symptoms declared themselves on the 13th. On the 15th the patient was admitted to be in a precarious condition. His pulse went to 130, and he was affected with "rigors" and vomiting. Thereafter the stomach was continually troublesome, and much of the time nutriment and stimulants were administered by injection.

There was an apparent recovery from the relapse of the 15th, and hope was still cherished. On the 18th inflammation of the right parotid gland was announced, which increased until an incision was made in it on the 24th. The condition of the patient was fluctuating during these days, and he began to express a strong desire to be removed from Washington. On the 25th his condition became critical, and on the day following fears of a fatal ending of all hope were entertained throughout the country. There were, however, slight indications of improvement on the 27th, which increased until by the 30th there was a renewal of hopeful announcements. On the 1st of September the question of removal was taken up again, and the gastric disturbance returning on the 4th, it was decided to take the patient to Long Branch, in accordance with his own earnest desire.

The journey to Long Branch was made on the 6th of September. The cottage of Mr. C. J. Francklyn, in Elberon Park, had been prepared for the reception of the President, and, with two others near by, was to be occupied by his family and attendants. A special train of the Pennsylvania Railroad was fitted up for the transfer from Washington to Long Branch, and arrangements were made for running it without delay and at a high rate of speed over the 228 miles of distance, which included parts of six different lines of railroad. The patient was removed from the Executive Mansion to the Baltimore and Potomac Railroad station without serious disturbance, at an early hour in the morning, and was made as comfortable as possible in a car specially fitted for the purpose. The departure from Washington took place at 6:30 A. M. The route was over the Baltimore and Potomac Railroad to Baltimore; thence, passing the outskirts of the city, it entered upon the Philadelphia, Wilmington and Baltimore Railroad; passing over the Junction Railroad from Gray's Ferry to West Philadelphia, and thence to Mantua, it proceeded by the New York division of the Pennsylvania road to Princeton Junction, thence to Monmouth Junction, entering upon the Amboy division, and reaching the Long Branch division of the Central Railroad of New Jersey at Sea Girt. The rate of speed was at times as high as sixty miles an hour; few stops were made, and Long Branch was reached at one o'clock—3,500 feet of railroad-track having been laid specially to convey the train from the regular station to the immediate vicinity of the Francklyn cottage, at Elberon. The following is the medical bulletin issued the same evening:

6.30 P. M.—Since the last bulletin was issued, the President has been removed from Washington to Long Branch. He was more restless than usual last night, being evidently somewhat excited by anticipations of the journey. This morning, at 5.30 o'clock, his pulse was 118; temperature, 99° 8'; respiration, 18. We left Washington with the President at 6.30 A. M. Owing to the admirable arrangements made by the Pennsylvania Railroad Company, and to the

ingeniously arranged bed, designed by Mr. T. N. Ely, the fatigue incident to the transportation was reduced to a minimum. Nevertheless, as was anticipated, some signs of the disturbance produced by the journey have been exhibited since his arrival, by rise of temperature and increased frequency of pulse. At present his pulse is 124; temperature, 101° 60'; respiration, 18.

ROBERT REYBURN.

The President showed signs of gratification at the change, but there was no immediate evidence of improvement. On the 8th the symptoms were regarded as promising again, and at the patient's request Drs. Barnes, Woodward, and Reyburn withdrew from the case, leaving it in the hands of Drs. Bliss, Agnew, and Hamilton. The same week a day of prayer for the recovery of the President was observed in several of the States. For two or three days the reports were hopeful, but bronchial trouble was developing, and threatening the lungs. From the 11th to the 15th the reports were fluctuating and rather dispiriting. The patient was placed for a few hours each day in a reclining chair where he could gaze from the window of the cottage upon the sea. On the 16th there was a serious relapse, with marked symptoms of blood-poisoning, including severe chills, fever, and inability to retain anything in the stomach. The last day is thus briefly described by Dr. Bliss:

At 8 A. M., September 19th, the pulse was 106 and feeble; temperature, 103° 8', and all the conditions unfavorable. In half an hour afterward there was still another chill, followed by febrile rise and sweating, and also with pain as before. During the periods of chill and fever he was more or less unconscious. He passed all day in comparative comfort, and at 8.30 in the evening his pulse was 108, respiration 20, and temperature evidently a little lower than normal. At 10.10 P. M. I was summoned hastily to the bedside, and found the President in an unconscious and dying condition, pulseless at the wrist, with extreme pallor, the eyes opened and turned upward, and respiration 8 per minute, and gasping. Placing my finger upon the carotid, I could not recognize pulsation; applying my ear over the heart, I detected an indistinct flutter, which continued until 10.35, when he expired. The brave and heroic sufferer, the nation's patient, for whom all had labored so cheerfully and unceasingly, had passed away.

Besides the physicians there were present at the moment of death Mrs. Garfield and her daughter, Colonel Rockwell, Mr. O. C. Rockwell, General Swain, Dr. Boynton, J. Stanley Browne and Warren Young, the President's private secretaries, and four attendants of the sick-chamber. Death was preceded by a severe pain at the heart, and the President's last words were, "O Swain!" The announcement of his demise evoked expressions of universal grief, not only throughout this country but from the principal cities of the Old World. Messages of condolence came from representatives of authority abroad as well as at home, and from many private and unofficial sources.

The following personal message was sent to Mrs. Garfield by Queen Victoria:

BALMORAL COURT.
MRS. GARFIELD, LONG BRANCH: Words can not express the deep sympathy I feel with you at this terrible moment. May God support and comfort you as he alone can!
THE QUEEN.

An autopsy of the body was made on the afternoon of September 20th, Dr. D. S. Lamb, of the Medical Museum at Washington, handling the knife, and all the physicians who had taken part in the case, as well as Dr. Andrew H. Smith, of Elberon, being present. The result showed that the diagnosis of the wound, so far as it concerned the course of the bullet, had been mistaken from the start. The following is the official announcement of the result of the autopsy:

By previous arrangement a *post-mortem* examination of the body of President Garfield was made this afternoon, in the presence and with the assistance of Drs. Hamilton, Agnew, Bliss, Barnes, Woodward, Reyburn, Andrew H. Smith, of Elberon, and acting Assistant Surgeon D. S. Lamb, of the Army Medical Museum, Washington. The operation was performed by Dr. Lamb. It was found that the ball, after fracturing the right eleventh rib, had passed through the spinal column in front of the spinal canal, fracturing the body of the first lumbar vertebra, driving a number of small fragments of bone into the adjacent soft parts, and lodging below the pancreas, about two inches and a half to the left of the spine, and behind the peritonæum, where it had become completely encysted. The immediate cause of death was secondary hæmorrhage from one of the mesenteric arteries adjoining the track of the ball, the blood rupturing the peritonæum, and nearly a pint escaping into the abdominal cavity. This hæmorrhage is believed to have been the cause of the severe pain in the lower part of the chest complained of just before death. An abscess cavity, six inches by four in dimensions, was found in the vicinity of the gall-bladder, between the liver and the transverse colon, which were strongly adherent. It did not involve the substance of the liver, and no communication was found between it and the wound. A long, suppurating channel extended from the external wound between the loin-muscles and the right kidney almost to the right groin. This channel, now known to be due to the burrowing of pus from the wound, was supposed during life to have been the track of the ball. On an examination of the organs of the chest evidences of severe bronchitis were found on both sides, with broncho-pneumonia of the lower portions of the right lung, and, though to a much less extent, of the left. The lungs contained no abscesses and the heart no clots. The liver was enlarged and fatty, but free from abscesses. Nor were any found on any other organ, except the left kidney, which contained near its surface a small abscess about one third of an inch in diameter. In reviewing the history of the case in connection with the autopsy, it is quite evident that the different suppurating surfaces, and especially the fractured, spongy tissue of the vertebra, furnish a sufficient explanation of the septic condition which existed.

D. S. LAMB.

Dr. Bliss concluded a review of the case, published in the "Medical Record," in October, as follows:

The most important points revealed by the autopsy, and which are to be considered by the profession, are:

1. Would the condition of the President, immediately after his injury, have justified a more thorough exploration of the wound, or would such a procedure have been safe at any time before primary reaction was established?

2. Was his transfer to the Executive Mansion timely and properly made?

3. Were the best and most judicious means instituted to secure prompt reaction?

4. After reaction was comparatively complete on the 3d of July, and when there had occurred spontaneous evacuations of normal urine and alvine evacuations, and an absence of any evidence of internal hemorrhage or peritonitis, would further exploration have been necessary, especially when it is considered that the probable reopening of the lacerated vessels would induce hemorrhage?

5. Were the surgeons then in attendance justified in deferring any further exploration until the arrival of the distinguished counsel on the morning of July 4th?

6. At the consultation, July 4th, and after it was proved to be impossible to follow the track of the ball any considerable distance beyond the fractured rib, would an operation have been justifiable, necessitating an incision through the soft parts, and a removal of a portion of the rib, so as to develop the track?

7. In the light of modern military surgery, which teaches the readiness with which leaden balls become encysted, would an operation at any time for removal of the missile have been justified unless there was some evidence of the missile being a source of irritation?

8. Considering carefully the condition of the President during the entire period of his illness, and the facts revealed by the autopsy, would not any operation for the purposes before mentioned have placed the President's life in great jeopardy, and, at best, have hastened the time of his death without affording any signal relief?

9. Was the treatment of the case as presented proper, and did it or not prolong his life to the utmost limit?

10. Was the mistaken diagnosis a natural result of the conditions present, and, to have developed a correct diagnosis, would not operative procedures have ensued?

11. If we had known the exact course and locality of the ball, and the organs injured in its passage, should the treatment have been modified in any particular?

I desire to say, in a brief review of the leading facts as to the general conduct of the case, that it has been apparent to the medical reader that my prognosis was favorable, and, notwithstanding the mutations, I augured a successful termination. It is but justice to myself to state that my prognosis was based on a lesion of minor importance. Had our diagnosis been correct, modern surgery should have conducted the case to a successful termination. I believe the medical profession, whom I address, will bear me out that the prognosis was correct, if the diagnosis had been also correct. I was not always able, during the progress of the case, to account for many of the more profound symptoms, and yet could not succeed in learning of any more extensive or complicated lesions than were first suspected. I desire to make the inquiry whether more extensive explorations could have been safely made, or whether the condition presented—a knowledge of the relative position of the patient to the assassin, the character of the missile, and the condition of the lesion and symptoms which follow—would have directed the investigation toward the actual track and lodgment of the ball, the track of the ball presenting a course of entrance downward and forward to the point of impingement upon the eleventh rib, and being then deflected to the left at almost a right angle, passing behind the kidney, perforating the intervertebral cartilage and first lumbar vertebra

anterior and to the left of the kidney, and finding its lodgment below the left extremity of the pancreas, wounding in its track the splenic artery. I would ask if any known instrument or means of exploration has ever been presented to the profession capable of tracing before the death of said patient the course of this bullet? Also whether the conditions could have been improved or mitigated, or his life preserved longer by any other line of treatment; whether, in view of the facts, modern conservative surgery could offer anything more for the comfort or recovery of the illustrious patient?

It is proper to state, in conclusion, that the most approved antiseptic dressings were used during the entire progress of the case.

There was considerable lay and professional discussion of the medical treatment, the general conclusion being that, aside from the mistaken diagnosis, the wound was necessarily mortal, and it is doubtful if anything more could have been done to mitigate the sufferings of the patient.

The remains lay at the Franklyn Cottage, Elberon, until Wednesday, September 21st, and the public was admitted to view the face of the dead President. After brief religious ceremonies at ten o'clock, on the 21st, the body was borne by special train from Long Branch, and, passing silent and reverent crowds at every station, reached Washington at about 4.30, where it was received by an imposing funeral escort and taken to the Capitol. It was laid in state under the great dome, previous to being taken to Cleveland, Ohio, for burial. It was exposed to view during the 22d, and crowds of people passed through the rotunda to look upon the face of the deceased. Meantime, preparations were made in Cleveland for receiving the remains, and there the principal obsequies were to take place. On the afternoon of the 23d, after impressive ceremonies in the rotunda of the Capitol, the coffin was borne to the station of the Baltimore and Potomac Railroad, and the funeral train started a little after five o'clock. Official representatives of the various departments of the Government, of most of the States, and many municipal corporations, accompanied or followed the remains. The train, heavily draped with mourning emblems, entered Cleveland at 1.20 o'clock p. m., on the 24th, and the body was placed in state on a catafalque beneath a pavilion erected for the purpose in the center of Monumental Park. All day on Sunday, the 25th, a great concourse of people passed the pavilion, and on the following day an impressive funeral took place, and the remains were deposited in a tomb in Lake View Cemetery, to await the preparation of the place of final sepulture which had been set apart for the purpose by the trustees of the cemetery. The procession included a military and civic pageant of unusual proportions. The day of the funeral, September 26th, was observed throughout the country as an occasion of general mourning, in response to a proclamation of President Arthur, which had been supplemented in many of the States by the recommendations of their Gov-

ernors. There was a general suspension of business, a draping of public and private buildings, and religious services in many churches. The day was also extensively observed in Europe, and for the first time mourning was ordered in court circles in behalf of an official of a republic. A committee was at once organized in Cleveland to take charge of the project of raising an appropriate monument over the final resting-place of the dead President, a popular subscription for the purpose being invited. Already a subscription had been started in New York for the benefit of the bereaved family, which reached the sum of over \$360,000, the income to be paid to Mrs. Garfield during her life, and the principal to be divided among her children on her death.

GEOGRAPHICAL PROGRESS AND DISCOVERY. On the 20th of December came tidings from the Jeannette polar expedition, which had not been heard from for two years and a quarter, and was almost given up as lost. The Governor of Eastern Siberia telegraphed that the Jeannette had been wrecked, and that two boat-loads of the crew had landed near the mouth of the Lena River. The Jeannette was crushed in the ice on the 23d of June, about five hundred geographical miles northeast of the Lena delta, in latitude 77° north, longitude 157° east. The officers and crew retreated with sledges and boats. They embarked in three boats, which kept together till, within fifty miles of the mouth of the Lena, they were driven apart by a heavy gale, and prevented from finding each other again by a fog. The whale-boat, containing Lieutenant Danenhower, who was disabled, Chief-Engineer Melville, who took the command, and nine men, entered the east mouth of the Lena River on the 17th of September. They were stopped by ice in the river, but found a native village, where they received succor. Melville placed himself in communication with the Russian commandant at Boloemga. They were promptly assisted by the Russian authorities, and afterward conveyed to Yakutsk. Ninderman and Noras arrived at Boloemga, October 29th, bringing the information that the first cutter, containing Lieutenant De Long, Dr. Ambler, and twelve men, had landed at the north mouth of the Lena. They were in a pitiable condition, all badly frozen, and in danger of starvation. Native scouts were sent out to relieve them. As soon as he was able, Melville conducted a search-party to the mouth of the Lena to relieve the other boat's crew. He found the spot where De Long and his companions had encamped, but they had all departed. The log-books and instruments of the Jeannette were buried in the ground, and the spot marked by stakes. Three letters by De Long were found in the deserted huts. Notwithstanding the information afforded by these records of the intentions of the retreating party, a prolonged search proved fruitless. The Russian authorities took measures for continuing the search during the winter. Melville received

permission from Washington to remain with two men and renew the quest in March. At the close of the year no news had been received of the second boat, containing Lieutenant Chipp with the rest of the crew. Danenhower and the other nine men of the rescued party set out for the United States. Lieutenant Danenhower was incapacitated for commanding the party or taking part in the search by reason of temporary blindness.

The Jeannette expedition was equipped at the expense of the publisher of the "New York Herald," J. G. Bennett, and departed on a polar search in 1879, sailing from San Francisco, July 8th. The commander was Lieutenant G. W. De Long, of the United States Navy, an experienced Arctic explorer, who had taken part in the expedition on the Juniata in 1873, in search of the survivors of the stranded *Polaris*. The steam-yacht *Pandora*, just returning from an Arctic voyage, was purchased for the expedition, and strengthened and fitted out with every appointment for a long voyage in the polar regions. She was provisioned for three years. Captain De Long selected the route to the east of Wrangel Land. He expected that he would be obliged to resort to sledges in ascending to the pole, and chose this untried route, because the ice in the regions north of Behring Strait is of a more favorable character than about Smith's Sound, or Franz-Josef Land, where the highest latitudes had been made. There was supposed to be much land north of East Siberia, if Wrangel Land itself was not an Arctic continent, possibly the continuation of Greenland, as conjectured by Petermann. The last authentic news from the Jeannette was the letters to the "Herald," from Oonalaska and St. Lawrence Bay, before she sailed for the unexplored north, the latest dated August 27, 1879. She was last seen on the 2d of September of that year, sailing on the intended course, fifty marine miles south of Herald Island.

The Jeannette was a steam-yacht, built originally for the British Government, and intended as a dispatch-boat. She was bark-rigged, with considerable rake, long and narrow, and lying low in the water. She registered 420 tons. She was sold by the Royal Navy, immediately after she was built, to Allan Young, an English yachtsman and Arctic voyager. After Captain Young had made one trip in her, she was purchased by James Gordon Bennett for the Herald expedition. Her beams and braces were re-enforced until it was thought that she could not be nipped in the ice. She already had a wedge-shaped floor, a form which was supposed to insure her against being crushed between ice-floes, as is common with flat-floored or straight-sided vessels, the sloping bottom being designed to raise her above the ice. Lieutenant George W. De Long was born in New York in 1844, and received his promotion as lieutenant in the navy in 1869. He was an enthusiastic polar navigator, and was bent upon being the discoverer of the north pole. He had the repu-

tation of being an officer of much energy and executive talent. The second officer was Lieutenant Charles W. Chipp, of the United States Navy, who had been a companion of De Long in a perilous voyage in a steam-launch to the northward from Upernavik, in Greenland, where the *Juniata* was stopped by the ice in the search for the missing members of the *Polaris* crew. The third officer was Master John Wilson Dannenhower, of the United States Navy. The engineer, George W. Melville, had served on the *Tigress*, in her voyage for the relief of the *Polaris* party. Dr. James Markham Marshall Ambler, the physician, was a surgeon in the navy. Jerome J. Collins, the scientist and correspondent of the "New York Herald," was born in Cork, Ireland, in 1841; an engineer by profession, he was the organizer of the "Herald" weather bureau, which was started about 1873. Raymond L. Newcomb was the taxidermist. The ice-pilot was William Dunbar, an experienced whaling captain. The crew was composed as follows: Jack Cole, boatswain; Alfred Sweetman, carpenter's mate; George Washington Boyd, carpenter; William Ninderman, carpenter; Walter Lee, machinist; George Landertack, coal-heaver; Louis Phillip Noras, Herbert Wood Leach, Henry David Warner, James H. Bartlett, George Stephenson, Adolph Dressler, Carl August Gortz, Peter Edward Johnson, Henry Wilson, Edward Star, Hans Haelnor Erickson, Henry Hansen Kaaok, Neils Ivorson, and Albert George Kaihne, seamen. There were also two Chinamen in the crew.

De Long stated his intention of landing on Wrangel Land, and of leaving records in cairns on its eastern shore, and on Herald Island. No serious apprehensions for the safety of the expedition were felt until the spring of 1881. When the news came that Lieutenant Berry, commander of the *Rodgers*, had thoroughly explored, without finding any traces of the *Jeannette* expedition, the coast of Wrangel Land, which was found to be an insignificant island, thus disappointing all the theories as to the configuration of the region and the course of the *Jeannette*, the anxiety concerning the safety of the explorers was intensified. Rumors had come of shipwrecked white men seen by natives in different parts of the coast of the Arctic Ocean. The smoke of a steamer was reported to have been seen by Yakuts near the mouth of the Lena River, in September, 1880. A party of white sailors were reported to be making their way up the Mackenzie River, and the Hudson Bay Company was urged to institute a search in that region. A report came later that wandering Samoyeds had found the corpses of two Europeans on the Siberian coast, near the mouth of the Yenisei. Experience of the currents of the Arctic strengthened the conclusion that the *Jeannette* when ice-bound had been carried to the westward instead of eastward. Another conjecture was that De Long had ascended to the pole in sledges, and then made his way either to Smith Sound or

Spitzbergen, the nearest points where he would be likely to fall in with walrus-hunters. There was the possibility also of his reaching a very high latitude in clear water, and then being caught in the ice or prevented from continuing his northward course by the ice-pack. The ship might then be carried to the islands at the entrance of the northwest passage, or upon Grant Land, or the northern coast of Greenland. If there should be found to be an open polar sea, it was conjectured that the *Jeannette* might have sailed clear across the polar basin and have come out on the east coast of Greenland, or the northern shore of Spitzbergen. No polar expedition since the loss of Sir John Franklin's party has caused so much solicitude, and elicited so many efforts for its rescue. During the season of 1881, measures were taken to search every shore of the polar basin for the lost explorers.

Five expeditions were sent into the polar regions by the United States Government in 1881, all of which took instructions to search for the missing Arctic cruiser, one of these having for its sole object the search for the *Jeannette* and the lost whalers, Mount Wollaston and Vigilant. This was the *Rodgers* expedition, under the command of Lieutenant Berry, which was sent over the same route pursued by the *Jeannette*, in the hope of finding on Wrangel Land records of the expedition and indications of its future movements. At about the same time that the *Rodgers* left San Francisco the *Alliance*, under Commander Wadleigh, sailed from Norfolk for the waters north of Spitzbergen, on the chance of the expedition's having crossed the pole in sledges. The revenue cutter *Corwin*, in command of Captain Hooper, was directed to land on Wrangel Land, if possible, during the summer cruise, to seek for traces of the *Jeannette*. The two government meteorological expeditions to Alaska and to Smith Sound were also instructed to explore the regions near their stations in quest of indications of the fate of the *Jeannette*. Leigh Smith, the English explorer, in his summer's trip to Franz-Josef Land, volunteered to make a special search for the *Jeannette* in that neighborhood, and the Dutch exploring ship *William Barents* also intended searching the coast of Nova Zembla for traces of the expedition.

The special search expedition under Lieutenant Berry was directed, if the researches on Wrangel Land proved fruitless, to repair to the coast of Siberia, and pursue their inquiries along the whole northern shore. At the time when the news of the rescue of part of the *Jeannette*'s crew came, Lieutenant Hovgaard, Nordenskiöld's companion, was planning an expedition over the track he had sailed in the *Vega*, to search the same ground which Berry was to go over later. He concluded, from the report of a steamer having been seen off the mouth of the Lena, together with that of white men found dead by Samoyeds at the

mouth of the Yenisei, that the *Jeannette* had met with disaster off the shore of Asia. His conjecture was that De Long had skirted the ice-fields to the westward until he had made up his mind to make a dash for the pole through the first favorable opening rather than continue on to Franz-Josef Land, where it had already been attempted. Before the *Jeannette* sailed from America, De Long had announced his intention of retreating to the Siberian settlements in case of shipwreck.

The expedition under Lieutenant Berry was sent out after the *Jeannette* and the missing whalers by the Government. An appropriation of \$175,000 was voted by Congress for the purpose. The steam-whaler *Mary* and *Helen* was purchased for \$100,000. She was re-vamped and fortified at a considerable expense. Among the provisions was a large supply of pemmican, but no spirits except for medicinal use. Under the new name of the *Rodgers* the ship put to sea June 16th. The commanding officer, Robert M. Berry, lieutenant in the navy, is an experienced Arctic voyager who served on the *Tigress* expedition. The first officer and navigator was H. S. Waring; the second officer, Charles F. Putnam. Other members of the expedition were Stoney Hunt, Engineer A. V. Jane, Paymaster W. H. Gilder, and Naval Surgeons J. D. Castillo and M. D. Jones. The crew numbered twenty-six men. The vessel stopped at Petropaulovsk to take on board arctic clothing, dogs, and sledges. According to their instructions, they first made inquiries along the Siberian shore from East Cape to Koliutchin Bay, and then sailed for Wrangel Land. They were directed to winter on the southern coast of Wrangel Land, or, if unable to make a landing, among the Telukthes of Siberia. The instructions were to search particularly along the southern and eastern coast of Wrangel Land, and on Herald Island, for the cairns which De Long had announced that he would leave, or other traces of the *Jeannette*, and the following season to continue the search along the northern shore of Siberia, and then return home. Lieutenant Berry was the first explorer who ever made a landing on Wrangel Land. He established the fact that it is only a small island instead of the southern point of a vast circumpolar continent, as has been supposed by geographers.

Wrangel Land was again visited and more thoroughly explored the same season by the officers of the *Corwin*, who came on the same mission which brought Lieutenant Berry. The revenue cutter *Corwin* is a steamer of 227 tons burden, and capable of a speed of eleven knots an hour. The commander was Captain Hooper, who had with him five officers, three machinists, the surgeon, Dr. Rosse, and thirty men. A naturalist, Muir, of San Francisco, accompanied the expedition, and another, Nelson, joined the expedition at St. Michaels. The *Corwin* succeeded in effecting a landing on Wrangel Land, in August.

This hilly Arctic land is constantly encompassed by a fringe of impenetrable ice which has defied all the efforts of former voyagers to approach the shore. The government steamer did not effect a landing until she had cruised along the coast for several days, and then only by cutting her way between the ice-blocks for eight or ten miles. They struck the coast at the mouth of a broad and deep river. No snow remained except some patches upon the mountains. The country was desolate and devoid of life. Polar bears had left many tracks on the beach, but no animals were seen except a few birds. A fox-track was observed, and the burrows of a species of marmot. There were no signs of reindeer or musk-oxen, although there was abundant food for them. There was a scanty growth of mosses, lichens, and angiosperms. About twenty species of plants were counted, most of them in bloom. They are similar to those of the neighboring coasts of Siberia and Alaska. Coal was found, and appears to be present in abundance. The soil is a mixture of sand and clay. The rock is slate and granite, and contains quartz which has the appearance of holding a high percentage of gold.

Whalers in the Arctic Ocean have been caught in a strong current setting to the northeast from Behring Strait. On the chance of the *Jeannette* having been carried by this current to the North American Archipelago, the Arctic colonists on Lady Franklin Bay were ordered to search the shores of the islands in the vicinity of their settlement. In case there is an open passage north of Greenland, the missing cruiser might have drifted on this current into the North Atlantic, and have been cast ashore on the northern coast of Spitzbergen or the eastern coast of Greenland. On this contingency the naval steamer *Alliance* was dispatched under Captain Wadleigh to examine those coasts for traces of the *Jeannette*. Provisions in plenty, and a number of whalers and several boats were taken along for safety in case the ship was caught in the ice-pack east of Greenland. The *Alliance* had a scientific mission to perform, as well as the duty of seeking the *Jeannette*. The officers were instructed to carefully determine the limits of the ice-fields between Greenland and Spitzbergen, to record the temperature of the ocean at the surface and at the depth of five fathoms, to take observations of the specific gravity of the water at the depth of ten fathoms, and of the rise of the tides on the coasts of Spitzbergen. The steamer sailed June 16th, and put in during a storm at Reikiavik, Iceland, July 9th. They learned that the winter there had been the severest one recorded since 1610. The Arctic ice still approached to within thirty miles of the north coast. Reports of the extreme rigor of the winter of 1880-'81 from other parts of the Arctic regions increased the general anxiety as to the fate of the *Jeannette's* party. In parts of the coast of Hudson Bay the cold

was reported to have been of unprecedented intensity, and was said to have been unusually severe also at different points in Siberia.

The system of international polar stations for scientific observations, which has at last been inaugurated, was the outcome of the Austrian Arctic expedition, and was first proposed by the late Lieutenant Karl Weyprecht, of the Tegethoff. The plan was elaborated and the way prepared for its realization at the International Polar Conferences at Rome in 1878, at Hamburg in 1879, and at Berne in 1880. At the second of these conferences the representatives of Russia promised that their government would establish two stations, one at the mouth of the Lena and one on New Siberia Island; Norway agreed to maintain one at North Cape; Sweden one on Spitzbergen; Holland one at the mouth of the Gulf of Obi; Austria one on Nova Zembla; and Denmark one at Upernavik. The United States was expected to establish one at Point Barrow, and perhaps another at some point in the North American Archipelago; and Germany was solicited to establish a station on Jan Mayen. In 1880 Congress made an appropriation for the establishment of a polar colony, which was carried into effect in 1881. Lieutenant A. W. Greely, of the United States Army, was placed in command of the expedition. The place selected for the station was on Lady Franklin Bay, at the point where the Nares expedition had discovered a bed of coal. They were directed to build houses and observatories, and to remain until the summer of 1883. A sledge-party was to visit the elevated land near Cape Joseph Henry. Lieutenant Greely was qualified for conducting the meteorological observations by twelve years' experience in the Signal Service. Lieutenants Frederick F. Kilgubury and James B. Lockwood, his assistants, are army officers used to frontier service and privations. There were fifteen men selected from different regiments of the army and five subordinate officers of the Signal Corps. It was intended to send a vessel with supplies to the permanent colony in 1882 and 1883. The methods of taking and recording meteorological, tidal, magnetic, pendulum, and other observations, were settled upon at the Hamburg Conference. The collection of specimens of minerals, animals, and plants is to be pursued with particular attention. The expedition before ascending Smith Sound stopped at various places to obtain Esquimaux hunters, dogs, Arctic clothing, and all the necessities for extended sledge-journeys. The party were instructed to supplement their proper tasks with sledging-excursions in search of traces of the Jeannette, on the chance of her having been driven upon the Parry Islands or into their neighborhood. The party were conveyed up Smith Sound and landed at Lady Franklin Bay, August 11th. Dr. Pavy joined them at Disco.

Another international polar station has been

established by the Government at Point Barrow, in Alaska. This expedition, commanded by Lieutenant P. H. Ray, will remain out until the summer of 1884. Lieutenant Ray has for his assistants Dr. G. S. Oldmixon as surgeon; A. C. Dark, of the Coast Survey, as astronomer and observer of magnetic phenomena; Captain E. P. Herendeen as interpreter and commissary officer; and Sergeants J. Cassidy, J. Murdoch, and M. Smith, of the Signal Service Corps. The expedition sailed from San Francisco, July 18th, in the schooner *Golden Fleece*. The party will make natural history collections, and survey the neighboring country, in addition to the meteorological, magnetic, and other investigations into the physical conditions of the frigid zone, in which the regulations adopted at the Hamburg Conference will be followed.

The third polar conference met at St. Petersburg, August 1, 1881. Assurances were given of the establishment of the following observing-stations: one at Upernavik, on the part of Denmark; one at Bosskopen, in Finmark, by Norway; one on the Island of Jan Mayen, by the Government of Austro-Hungary, to be directed by Lieutenant Wohlgenuth, of the Austrian Navy; one, under the direction of Pilot Jürgens, at the mouth of the Lena, and another in Nova Zembla, by the Russian Government; one on Mossel Bay, in Spitzbergen, by Sweden, placed in charge of Captain Malmberg; and the two United States stations on Lady Franklin Bay and at Point Barrow. Besides the above, a station will probably be established by England at some point in British North America, and one by France at Cape Horn.

Leigh Smith sailed in his yacht, the *Eira*, in the early summer, bound for Franz-Josef Land, where he purposed continuing his explorations. On the 8th of July the *Eira* was seen off the west coast of Nova Zembla steering north, from which date up to the end of the year nothing further was heard from her, although her master had made no provision for wintering in the north. Leigh Smith has won the name of a courageous Arctic voyager. His most useful contribution to geographical knowledge was the tracing of a long strip of the unknown coast-line of Franz-Josef Land. The *Eira* is a steam-yacht of 360 tons burden which he had built expressly for Arctic cruising. He was accompanied on his present voyage by Dr. Neale, surgeon, and a crew of twenty-three men. All of Leigh Smith's five or six expeditions into the Arctic regions have been conducted entirely at his own expense. His exploration of 110 miles of new coast-line in Franz-Josef Land was the most important discovery recently achieved by private enterprise alone.

The conclusion reached by W. H. Dall, of the United States Coast Survey, in his long and careful investigation on board the *Yukon* of the hydrographic conditions of Behring Strait, is that the current flowing in from the Pacific

through that channel has no appreciable influence on the temperature of the Arctic Ocean. The polar basin has an area of considerably more than 150,000 geographical square miles, and a depth averaging, according to present data, not quite twenty-eight fathoms. At a moderate estimate one half of the water is frozen at the beginning of summer. The maximum swiftness of the current through Behring Strait observed was one foot a second, and the highest temperature $8^{\circ}9'$ C., while the average temperature is $5^{\circ}8'$ C. The total effect of a constant current at the highest temperature noted would melt only about 8 per cent of the polar ice. The time during which the current passes freely through the strait is only ninety days in the year. The current through Behring Strait does not flow constantly northward, into the Arctic. If the set of the current is taken to be northward for two thirds of the year, and it is supposed to flow at the maximum swiftness, at the average temperature observed in Behring Strait, the total effect of the volume of warmer water flowing in through the strait would be to melt only 3.4 per cent of the ice in the Arctic basin, that is, to clear an area of about half the extent of Kotzebue Sound; and when the loss of heat by return currents and radiation into the air are taken into consideration, the influence of the current from Behring Sea into the Arctic Ocean must be insignificant. If the comparative size of the channel of Behring Strait and of the polar basin were duly considered, no theories would be built up which depend on the influx of warm water from the Pacific. If the polar basin were empty, it would require eight and a half months to fill it again through Behring Strait. The Kuro-Siwo has been supposed to divide at the Aleutes, one portion recurring and descending along the American shore, and another pouring into Behring Sea, and sending a stream of warm water into the Arctic. Dall denies that a branch of the Pacific Gulf Stream enters Behring Sea, between Kamchatka and the Aleutian Islands, or by any other channel. The Kuro-Siwo is very different from the Atlantic Gulf Stream; its volume is much smaller, and it is subject to extreme variations, which seem to be caused by the monsoons. The prevailing movement of the waters of Behring Sea is a flow of cold water to the southward. The surface layer has a general motion in the contrary direction, when not interrupted by winds, but neither in volume, in swiftness, nor in constancy is this flow strong enough to be considered an ocean-current. The surface-currents of Behring Sea are produced by or depend principally upon the winds, the influx of freshwater streams, the steady southward drift of the cold water, the distribution of the floating ice-masses, and the northward movement of the warmer surface-water; the activity of these several factors is indicated by the order of this enumeration. No warm current flows through Behring Strait from Behring Sea ex-

cept such as are composed of water from the inflowing rivers and neighboring sounds, which owe their warmth to the direct action of the sun's rays. The strait would not be large enough to let through a current of warm water sufficient in volume to exercise an appreciable influence on the portion of the polar basin lying north of it. The currents flowing through the strait are cold. They are mostly tidal currents, though their main tendency is to flow northward. The currents in the Arctic Sea north of Behring Strait are particularly subject to the influence of the winds, but tend to move in certain known lines of direction. The knowledge which we have of these up to the present gives no encouragement to the hope that through their action a navigable route to the pole or a passage to the northward for any distance is created. Not a single fact was discovered in the whole investigation in support of the popular but unscientific supposition that there are extensive areas of open water within the polar basin.

Dr. Pelligrino Mantecucci, a young Italian traveler, who had already distinguished himself by explorations in the Soodan, traversed the continent of Africa diagonally from Suakim on the Red Sea to the mouth of the Niger, emerging with his companion, Massari, at the west coast in July. Mantecucci and Lieutenant Massari were chosen by Prince Giovanni Borghese to accompany him on an intended journey to the little known and inhospitable Mohammedan kingdoms of the inner Soodan. The party set out from Cairo in February, 1880, for Suakim, and crossed the desert to Khartoum. They then traversed the sandy plains of Kordofan on camels. They traveled often at night, when they were safer from the attacks of robbers, and escaped the intense heat of the sun. They suffered much from want of water before reaching their destination, El Obeid, the capital of Kordofan. This city is the emporium of the trade in gum and ostrich-feathers. There are many Arab traders, but no Europeans resident there. At El Fasher, the capital of Darfour, the authority of the Egyptian Government, which had assisted and protected the travelers thus far, reaches its limit. In this town, which contains 10,000 inhabitants, they remained a long time, treating with the Sultan of Wadai through messengers, until they began to despair of gaining his leave to traverse his dominions. Here Prince Borghese, yielding to the solicitous messages from his family, left the party and returned to Italy. As soon as they obtained the coveted permission to cross Wadai and visit its capital, Abeshir, they advanced into the strange land by the same route which Nachtigal had traveled. The Sultan of Wadai is possessed with the belief that he will die at the hands of a Turk, and as all light-hued people are counted Turks by him, he rigidly excludes Europeans from his kingdom. Mantecucci persuaded the superstitious potentate that they could neither of them be his predicted slayer,

as they were come from a powerful kingdom far away, whose monarch had sent to him magnificent presents, of which they were the bearers. They entered the dominions of the Sultan of Wadai in November; he declared that he would be responsible for their safety, and sent his son and his brother to meet them.

Wadai, which has never been examined at ease by any European traveler before, includes the states of Baghirmi and Dar Ranga in the south, extending on the north to the edge of the desert. Its western boundary is the Bornoo frontier, and its eastern an indefinite line through a district inhabited by Kanem tribes. The chief products and exports of Wadai are ivory and ostrich-feathers. The country is rich in camels and horses. The western portions, however, are sterile and waterless.

After crossing Wadai they traversed Baghirmi, Bornoo, and Sokoto, visiting Lake Tehad. From the city of Kano-Nupe they crossed to the Niger, and descended the river to the Gulf of Guinea. This journey cost the young traveler Manteucci his life. He had already distinguished himself on perilous expeditions in the Soodan. After his arrival in London he died of a wasting African fever.

Before the successful and courageous accomplishment of Dr. Lenz's expedition from Morocco to Timbuctoo no scientifically trained explorer had ever traversed the vast region lying between Barth's route through Rhat and Air and the Atlantic. The only knowledge we possessed of the whole western half of the Sahara was derived from the itineraries of a number of uninstructed travelers. Dr. Lenz set out on his arduous journey from Tangier in November, 1879, and, notwithstanding many delays and trying difficulties, reached Timbuctoo in July, 1880. He made his way to the coast from there by way of the Senegal, arriving at St. Louis in the following November. The adventures which befell him at the outset of his journey are referred to in the "Annual Cyclopædia" for 1880. He did not leave the city of Morocco till March 6th. In order to travel more safely, he assumed the character of a Turkish physician, and was accompanied by Sidi Hadj Ali, a relative of the famous Abd el Kader, whose presence afforded him security among the fanatical robber bands of Howara Arabs who scour the country on the farther side of the Atlas Mountains up to the very gates of Terodant. The Atlas range is composed of three parallel chains in which the strata of the tertiary and cretaceous periods mark the date of their elevation. The highest summit is the snow-covered Mount Miltzin, 3,461 metres in height. He remained several days at Sidi Hescham to purchase camels and fit out the caravan, and then crossed the Anti-Atlas. This range, which does not rise above 1,500 metres, is of palæozoic formation. On the farther side of the mountains the village Tisgi was found beautifully situated among springs and date-palms. On a neighboring

hill are ruins which are said to be of Roman origin. The extent of the traffic between these border-lands of Morocco and Timbuctoo, and the importance of the mart Tenduf, have been reported by the Rabbi Mordochai and others. Thither Lenz's modest caravan was next conducted. They found a prettily situated, young, and growing commercial town. More camels were procured, a guide engaged, and the final preparations for the long march through the Sahara were concluded. Four days out from Tenduf they entered the sandy desert, which was not, however, devoid of all life, for here and there were patches of vegetation, affording forage for the camels, and occasionally gazelles and antelopes were seen. On the 18th of May there was even a fall of rain. The course of the march was due south-east from Tenduf to Taodenni, and then about southerly to Timbuctoo. Not far from Tenduf they entered a wide stretch of hard and rocky ground, almost destitute of water. In thirty-one days they passed only four wells. This description of surface, hard, arid, and free from shifting sands, is called *hammada*. They next passed through a zone of *aregs*, or sand-dunes, before reaching the salt-beds of Taodenni. The hills of sand, heaped up by the wind, were exceedingly difficult to cross. The temperature was agreeable for night-marches, the mean not exceeding 34° or 36° C., and cool northwest winds prevailing. The latter fact militates against the theory of the formation of the desert by the constant passage of currents of dry air from the northeast. The other theory, that the Sahara formed the bottom of a sea in recent geological time, is considered unfounded by Lenz, who ascribes the accumulation of sand mainly to the erosion of the mountains, which is still going on over the vast surface of the *hammada* plains. The fact that the fossils contained in the rocks here are of fresh-water animals proves that the sand was not formed by marine action, and that this portion of the Sahara is not, as has been supposed, the elevated bed of a tertiary sea. The phenomenon of singing sand was heard. This is supposed by Lenz to be the effect of friction upon the heated quartz-grains. The aspect of the Sahara is varied, plains of sand succeeding rocky ground, with occasional oases covered with *alfa*, containing stagnant or shallow pools of water. The barometric observations of Dr. Lenz put an end to the adventurous scheme for the inundation of the western Sahara. No part of the desert was found to lie below the ocean-level. The average elevation was from 250 to 300 metres. The region about Taodenni forms a depression in which in one spot, at Wady Telli, an elevation of only 148 metres was measured. They did not venture to visit Taodenni and its salt-mines, making a *détour* to the eastward which brought them to the interesting Wady Telli. The walls of this ancient town were made of rock-salt and clay. Implements of the stone age made from diorite

are found here in such quantities that they are an article of commerce, being sent as far as Timbuctoo, where they are used as kitchen utensils. South of Taodenni sand and *ham-mada* alternate, until a stretch of sand-dunes was reached near Arawan. Here the prevailing winds come from the south. Arawan is, as formerly, the point where the caravan-traffic between Timbuctoo and the north centers. Here the effects of the unfortunate Major Laing are said to be still preserved, but his papers were sent forward before his death and are supposed to have arrived in Ghadames. He was murdered while mounting his camel to depart. The motive, according to one tradition, was jealousy; according to another, revenge for the death of a magnate whom he had treated medically. Lenz was obliged to pay toll to the chief who resides at Arawan. A day's journey south of that station they entered a belt covered with a mimosa-growth which extends as far as Timbuctoo and to the west of it.

Lenz was received kindly in Timbuctoo, in contrast with the treatment which Barth received, who was detained seven months, in constant fear for his life. Lenz remained about a week, the guest of the head magistrate. The Fullani and Tuaregs, who compose the population, continue to show the same jealousy and enmity toward each other which divided them in Barth's time; but with this change in the situation, that while the Sheikh el Bakay was then upheld by the Tuaregs, his son and successor, Abadin, is supported by the Fullani. Lenz, like his predecessor, was drawn into interminable arguments over the Koran with the aristocracy of the town. The size of Timbuctoo and the extent of its trade, however exaggerated, must have been greater in former ages, as is indicated by the number of unoccupied and ruined dwellings. Its circumference is fully five miles. It seems now, however, to be again growing in population, since Lenz reports the number of inhabitants, which was estimated by Barth at 13,000, and by Caillié at 10,000 to 12,000, as about 20,000. Timbuctoo is still the chief slave-mart of the Western Soodan. In its suburbs are large numbers of unoccupied huts in which the caravans take up their quarters and store their merchandise, consisting of slaves, dates, ivory, gold-dust, rubber, and ostrich-feathers. The houses of Timbuctoo are built entirely of brick. They are low, but roomy. The city supports numerous schools and possesses rich libraries. There are three mosques, surmounted by picturesque minarets. Timbuctoo is still the center in which the commercial exchanges between the Western Soodan and the Niger regions on the one hand and the Sahara and Mediterranean lands on the other are conducted. Apart from the slave-trade the exports from the southern countries are inconsiderable. The slave-trade is itself much smaller than in former times, owing chiefly to the declining

wealth and purchasing power of the Moham-medan nations bordering the Mediterranean. Timbuctoo does not lie directly upon the Niger, but has water communication with its port, Kabara, through a number of little lakes and a natural canal which connects them.

Instead of ascending the Niger, Lenz made his way across the country through the populous lands of the Massina and Bambarra to the Senegal, which he struck near the French station Medine. The country between Timbuctoo and the Senegal consists of a plateau with an average elevation above the sea-level of 320 metres. The climate of the Soodan presented an unpleasant contrast to the wholesome air of the Sahara; although Lenz retained his strength, the Arab members of his company fell sick, and it was with joy that they finally reached the edge of the plateau and descended into the valley of the Senegal. At Basikunnu the caravan was attacked by a band of Arab robbers, who desisted from their predatory designs, the chief even serving them as guide, after the sheriff had disclosed his sacred character of a descendant of the Prophet. At Basikunnu the camels were exchanged for oxen, and the expedition proceeded, first southward to Sokolo, otherwise called Kala, in Bambarra land, and then westward. Sokolo is a town of 10,000 inhabitants, subject to Ahmadu, Sultan of Segou, whose family exercises a suzerainty over this whole region. They next came to the large double town of Gumbu, containing 30,000 inhabitants, mostly Arabs. Farther on, at Niore, all their possessions were taken from them; but the way was not long from there through Kuniakary to Medine, where the traveler was cordially received by the French commandant.

Savorgnan de Brazza, the determined pioneer of exploration on the upper Ogowe, has passed nearly two years more in the examination of the same region and in the establishment of stations and opening of commercial intercourse with the interior in the commission of the French branch of the International African Association. He arrived at the Gaboon in December, 1879, and conducted his expedition up the Ogowe to choose the site of the station which he came to establish. He founded the post at the mouth of the river Bassa, which enters the Ogowe on the left bank, giving it the name of Franceville. Leaving this camp in July, 1880, he crossed to the river Alima, the tributary of the Congo, which he had discovered on his previous visit with Ballay. The plateau of the Batékés, 2,600 feet above the sea, situated between the Alima and the Mpaka, is a fertile region inhabited by peaceful tribes subject to Maskoko, ruler of the warlike Ubangis, the Apfuru people who hotly contested Stanley's passage down the Congo. Brazza descended the Lefini, Stanley's Lawson River, to Pulobos, in the heart of their country, determined to obtain the friendship of this tribe, although he had been received

with manifestations of hostility upon his previous expedition. He succeeded in striking a treaty of peace with Maskoko, and obtained by purchase the cession of a strip of land, called Méuma, on the bank of the Congo, not far from Stanley Pool. On this territory he established a second French station, to which the name of Brazzaville has since been given. The country between the two stations is open and salubrious. It is expected that this will become an outlet route for many of the rich products of the Congo Valley. The traveler descended the Congo to Stanley's advanced post, about twenty-five miles above Vivi. The physical difficulties in the way of Stanley's enterprise of building roads around the cataracts seem to him insuperable. Mountain-chains, 6,500 to 10,000 feet in height, cross the course of the river, and numerous affluents enter it through deep ravines. In addition to these obstacles, the banks of the Congo here are peopled with bellicose tribes. De Brazza proceeded by sea to the Gaboon, and started again for Franceville. With Dr. Ballay he intends to descend the Alima in a steam-launch and thoroughly explore the Congo Valley.

When De Brazza ascended the Ogowé he was accompanied by Père Delorme, whose object was to select a spot for a mission-station. The latter paid considerable attention to the ethnographical conditions of the country. On the lower course of the river some Orungu villages are met with, inhabited by the Nkomis and Camas. The country here lies very low, and, being inundated during the great rains, is unhealthy. Farther up the river the country becomes more and more open, pleasanter, and higher above water-level; while the mangrove thickets disappear, and are replaced by forest-trees, including the date and other palms. After the Nkomis and Camas come the Galois, Eningas, and Adyombas. These tribes speak the same language that is used on the Gaboon. They are all very superstitious, but not fanatical, like the people about Cape Lopez. One hundred and ten miles up the river are found the Bakalais, who are being driven away by the numerous Pahuins; between the latter, occupying the right bank of the river, and the former, occupying the left bank, there is continual war. Père Delorme says that the Pahuins will here, as they have in the Commi country and on the Rembo, end by remaining masters of the region. They are not enervated by vice, and have no slaves nor human sacrifices. After passing these tribes the rapids are reached, rendering navigation very difficult and dangerous. Above these the river again becomes navigable, and different tribes are met with along the banks, such as the Okandas, Oshébas, Adumas, Ondumas, and others.

The cession of the greater part of his territory by the Sultan of Sulu to the British North Borneo Company, and the recently ventilated schemes of not only rendering the rich province commercially tributary, but erecting there

a political dependency and naval base for Great Britain, have drawn attention to this slightly known, but to ethnologists and naturalists exceedingly interesting island. The North Borneo Company obtained concessions originally granted by the potentates of Sulu and Brunei to an American company in 1865. The American adventurers not caring to continue the enterprise, they were bought out, in 1877, by an Englishman prominent in the Hong Kong trade, who associated with himself a number of other Englishmen, and in 1881 obtained a charter from the British Parliament. Not only the Dutch regarded the extension of British protection to the adventure with suspicion, as the Spanish Government claims prior rights and concessions in the same territory, and the Spanish Legislature has protested against the British protectorate. The natural products of Borneo are so numerous and abundant, and many of them so peculiar to the country as well as valuable, that it appears in prospect one of the richest regions of the globe. The Dutch Government claims the political control over the whole island, to the extent of prohibiting annexations by other powers. The only British settlement is on the small island of Labuan. The native state of Sarawak, comprising about 25,000 square miles of territory, with a population of 240,000 souls, was organized by Rajah Sir James Brooke, and has made considerable advances toward civilization and good government, a result which is due to his method of developing the country by native means under the guidance of European intelligence. This little nation has maintained its independence for forty years, in spite of the fears of its founder. With a yearly revenue of \$200,000, a sufficient military force is kept up to garrison fourteen forts, three gunboats are maintained, a competent staff of European officers and native authorities are paid, commerce and agriculture are protected, and security to life and property everywhere insured. The adjacent dominion of Brunei, comprising the coast-region of Northern Borneo between Sarawak and the northern end of the island, has been ceded to the North Borneo Company. The people of Brunei are sadly misgoverned and oppressed by the exactions of petty princes. The dominion of Sulu extends from Celebes Sea on the east to the range of mountains separating it from Brunei on the northwest. All the rest of the island, about three quarters of its entire surface, is claimed as Dutch territory. The central parts of Borneo are unexplored. Nearly all the large rivers rise near the center of the island, where there is, according to native reports, a very lofty mountain called Tibang. In this region rise the Bulongan and the Kutei, which empty on the east coast; probably the Kina Batangan, a fine river which flows through the territory granted to the North Borneo Company, and empties in a bay on the northeast coast; the Barito, or Banjer Massin, which flows to the

sonthward; and the Kapuas and Rejang, flowing westward. The highest known mountain is Kina Balu, in the North Borneo Company's territory, which has an altitude of 13,698 feet. There are several which rise to from 6,000 to 8,000 feet above the sea-level. The range of mountains which is set down on the map, running from the northeast to the southwest extremities of the island, has a number of breaks. There are several lakes in Borneo, but the one marked on the map as the largest, and called Kina Balu, probably has no existence. The inundation of the country in the rainy season may have given rise to the report of such a lake. All the lakes undergo remarkable variations in size and elevation between the rainy and the dry seasons. Borneo may be considered the home of the sago-palm, which flourishes only here and on the coasts of Sumatra, Celebes, New Guinea, and the Moluccas. The territory of Sarawak furnishes alone more than half the sago consumed in the world. William M. Crocker, the British Resident of Sarawak, who lived some time among the Milanows, a peculiar tribe in the northern part of that dominion, which has grown rich by the cultivation of the sago, has published interesting notes concerning them. They are of the same stock as the tribes of the interior, who still live in the lowest condition of savagery; but they were early visited by Malays for the purposes of trade, and have adopted the Malay dress, and many of them the Mohammedan religion. They have squarer features than the other tribes of the country. They are perhaps the only people in these islands who flatten the heads of their children. They formerly lived in great dread of pirates and of the head-taking sea Dyaks, and built their houses on high posts, but now they are efficiently protected by the government. They still keep a few skulls in their houses, but have abandoned the barbarous custom of capturing heads. Their skin is very light, having a sickly, milky-white appearance. The men are of medium stature. They are gentle and peaceable in disposition. Like the Dyaks, they are superstitious, and believe in dreams and omens. Their religion, or belief in evil spirits, greatly resembles that of the Cochinese. Gold is found in different parts of Sarawak. From the middle division of this country gutta-percha and rattans are largely exported, and considerable quantities of bilian timber, or iron-wood, are sent to China. The lower division, or Sarawak proper, is rich in minerals. Gold is worked by Chinese, and diamonds by Malays; but the principal products are antimony and quicksilver, the monopoly of which is given to the Borneo Company. Between 1859 and 1879, 25,000 tons of antimony were exported, valued at over \$1,000,000, and between 1870 and 1879 15,000 flasks of quicksilver, value \$717,500. Gambier and pepper are now being successfully cultivated, and an influx of Chinese capital and labor is expected. Turtle-eggs, and the roes of the trobok-fish,

which are esteemed a delicacy in China, are among the exports of Sarawak; rice is extensively grown and exported from some districts. There are several settlements of Chinese and a considerable population of Malays, besides the sea Dyaks, many of whom have become semi-civilized, mild, and peaceable.

Dr. Montano, during a scientific journey in Malaysia and the Philippine Islands in company with Dr. Paul Rey, visited North Borneo, landing at Elopura, on Sandakan Bay, where the North Borneo Company have a small station. He ascended the Sagalind River, which empties into that bay, to study in one of their villages the Buli Dupis, a previously undescribed race, differing essentially in its anthropological characteristics from the Malays. The village was a group of only ten huts in a clearing surrounded by dense forests. The Buli Dupis have features of a much higher type than the surrounding Malays and Suluns, and, where they are not modified by cross-breeding, closely approaching the European standard. They are not inferior to the other tribes in any respect, but the race seems to be diminishing in numbers. According to their tradition, they came originally from an island called Kamiguil, which is supposed to lie to the east of Sandakan. They take their name, Orang Buli Dupi (men of Dupi Mountain), they say, from a peculiar kind of tree called *dupi*, which grows on the hills of their island. They were formerly very numerous, and were scattered over many parts of the coast of Borneo, but now are found only at Sagalind, at Labnk, west of Sandakan, and at some points on the river Kino Batangan. Their language differs materially from those of the Malays and Suluns.

The great peaks of the Andes in Ecuador have been more thoroughly and more intelligently explored than they ever were before, by Edward Whymper, an Englishman, who had already won celebrity as the most successful of Alpine climbers. One of the objects of his researches was to observe the physiological effects of the atmosphere at great elevations, and the possibility of living on the summits of the highest mountains of the globe. By remaining a considerable time at elevations of from 16,000 to 18,000 feet, until they felt no inconvenience from the rarefied air there, which was at first utterly insupportable, Whymper and his party were able to ascend to the height of 19,000 feet and pass twenty-six hours there without experiencing any ill effects. He concluded that he could have mounted several thousand feet higher, but is not convinced that explorers could breathe the air at elevations of 24,000 feet or higher for any length of time, or that the human system can adapt itself to the diminished pressure, which, at such altitudes, is one third of that at the level of the sea. Another subject investigated was the working of aneroid compared with mercurial barometers at great elevations. His experiments led him to the conclusion that calculations of altitude

based upon the boiling-point of water are altogether untrustworthy in lofty mountain-regions. Whympfer was accompanied by two tried Italian-Swiss mountain-guides, the brothers Carrel. He first ascended Chimborazo and explored its neighborhood, then ascended Corazon, situated west of the town of Machachi, and attempted to ascend Illiniza from the south. With his two assistants he mounted to the summit of Cotopaxi, remaining twenty-six hours on the top. From Quito they ascended Antisana, which summit they failed to reach in the first attempt, but succeeded on another trial. Two of the peaks of Pichincha were explored, and then they departed for the north and examined the great mountain Cayambe, ascended the little-known peak of Sara-ureu, the most arduous ascent of all, and Cotocachi, the dominating peak of this district. Whympfer proceeded farther north to the towns of Ibarri and Carranqui, sending his Italian guides to seek a path to the summit of Illiniza, in which they were successful. Whympfer was broken down by his exertions, and remained some time at Quito. When he recovered he proceeded south, making an excursion to Altar without being able to see its summit, ascending Carihuairazo, and passing around the western side of Chimborazo, of which peak he made a second ascent. He returned to Guayaquil through Guamote and the pass called the Bridge of Chimbo.

The coast-region of Ecuador is low and flat, a great part of the country being submerged in the rainy season. It is reticulated by a confused net-work of rivers and lagoons connecting with one another. The slopes of the Andes are excessively steep, and are covered by a dense growth of gigantic trees festooned with parasitic creepers, and at their feet a mass of tangled undergrowth. There is an outer chain of mountains, not down on the maps, though extending 40 miles north and south and rising to the height of 15,000 feet. Beyond this is the main ridge of the Andes, which culminates in the peak of Chimborazo. The river Chimbo flows through the valley inclosed between the two ranges. The Andes south of Chimborazo have an average elevation of about 15,000 feet, and contain several smaller peaks, all of about the same size. There are few passes, the lowest one being perhaps the Bridge of Chimbo, which has an elevation of 12,000 feet above the sea. North of this the most frequently used pass is that of the road from Quito, which leads across the sandy plain called the Arenal Grande; this is about 14,000 feet in elevation. North of this pass rises the great mass of Chimborazo, which is separated by a depression on its northern side from Carihuairazo, a mountain with several peaks, the highest of which is nearly 17,000 feet in altitude. North of this mountain the range sinks abruptly to the basin in which is situated the town of Ambato, where the climate is temperate and agreeable. No important mountains are found to the west

of this place, nor for 80 miles to the north, until Illiniza is reached, which rises above 17,000 feet. In the next 85 miles to the north, and almost in a line with Illiniza, are the isolated peaks of Corazon, Atacatzto, and Pichincha. The depressions between them are never so low as 10,000 feet. North of Pichincha is another break in the range, formed by the valley of the river Guallabamba, which at one point has an elevation of only 5,600 feet above the sea. Then comes the mountain Mojanda, which does not rise to the snow-line, but covers more ground than any other mountain in Ecuador. North of this are the two large mountains Imbabura and Cotocachi, and then the basin of Ibarra, which is not much over 7,000 feet above the plane of the ocean, beyond which the elevation of the range increases. On the southeast is the great mountain of Cayambe, which is covered with 5,000 feet of snow and glacier, and farther on a glacier-bearing mountain called Sara-ureu. South of this there is no lofty summit until Antisana is reached, though the general elevation of the country is probably as great as 13,000 feet. This mountain covers a large area, and contains as much snow and ice as Cayambe. On the south no lofty mountains were seen, but on the west, in the same group with the peaks of Illiniza, Corazon, Atacatzto, and Cotopaxi, are Paschocha and Ruminahui, comparatively low, but steep and well-defined in shape, and Sincholagua, a fine, sharp peak. South of this is Cotopaxi, the second in height of the mountains of Ecuador. A considerable distance beyond is the snow-clad and very regularly formed summit of Tunguragua, over 16,000 feet high. Farther to the southward comes the basin of Riobamba, on the eastern border of which rises the extinct volcano Altar. Around the crater of Altar are magnificent needle-like pinnacles. South of here the country is of moderate elevation. Far to the southeast is visible the active volcano Sangai, which is but little smaller than Altar. The French explorers of the last century and Alexander von Humboldt are responsible for a serious error respecting the physical configuration of this region. The two parallel chains, set down on the maps as the western and eastern Cordillera, have no existence. The distribution of the mountains in Ecuador does not even show how such a misconception ever arose. The eastern part of Ecuador, where the Andes descend in undulations to the plains of Brazil, is an unknown region.

All the great Andes of Ecuador have been volcanoes. There are only two volcanoes in Ecuador which may be properly called active. These are Sangai and Cotopaxi, which are seldom at rest. Two others, Pichincha and Tunguragua, give occasional signs of life.

Sangai has been seen by but very few persons. Whympfer caught a glimpse of it but once, when encamped on Chimborazo at a height of 17,300 feet, though he frequently

heard its detonations, which were very distinct and startling. It presented the appearance of a regular cone, though less stately and symmetrical than Cotopaxi. It has large beds of snow on its summit, but above them its apex is black, and seems to be formed of slopes of fine ashes. At intervals of twenty to thirty minutes there were discharges of jets of steam which shot up 4,000 or 5,000 feet in the air, and then spread out and drifted away on the wind. No detonations were heard on Chimborazo, but at Guaranda, 9,000 feet lower, they were loud and clear. Cotopaxi emitted smoke and steam constantly. At the distance of 65 miles Whymper witnessed one violent eruption of ashes, which were projected 20,000 feet into the air, and produced the effect of twilight at that distance, although it was noonday. The most dangerous element in the eruptions of Cotopaxi is the floods of water which rush down its sides. The Ecuadorians believe that the water pours out of the crater; but Whymper explains the phenomenon by the melting of the large glaciers (which are not visible, being covered over with ash) by the heated cone. It has been erroneously stated that glaciers do not form on the Ecuadorian Andes, but Whymper found extensive ones on all the high mountains. They do not usually descend lower than 14,000 or 15,000 feet. The traveler did not experience the terrific winds of the Andes of which much has been written, and is inclined to believe that the force of the wind is very much less than would ordinarily be supposed. The astounding reports of the thunder-storms of the equatorial Andes are not exaggerated. The air seems saturated with electricity, and discharges are constantly heard, the whole sky being filled with flashing bolts. Whymper describes his experience of one of these thunder-storms as follows: "I shall never forget the occasion when on the top of Sincholagua and close to the summit, on a narrow ridge of icy snow in which we were cutting footsteps, a ridge so steep and narrow that the merest touch might have tumbled us over on one or the other side, we were surprised by a storm, which commenced without premonition, and in a few seconds raged above, below, and around us, with a fury which made us quiver, and maintained a ceaseless roll, as flash after flash darted across our ridge, and others struck, or appeared to strike, the rock pinnacles beneath us. With our axe-heads hissing, and not knowing whether it was more dangerous to go down or up, we at length went forward, snatched a few rocks from the immediate top, and then fled, scarcely daring to look behind, and escaped in safety, though astonished to find ourselves alive."

The following table contains a list of the peaks ascended by Whymper, the date of the ascents, the temperature at the summits, and the absolute altitude of the mountains, as determined by him, compared with the determinations of Drs. Reiss and Stübel:

DATE.	Mountain.	Temperature.	Whymper.	Reiss and Stübel.
		Fahr.	Fect.	Fect.
January 4, 1880.	Chimborazo. . .	21°	20,517	20,703

The latest observations establish the fact that the highest mountain of the globe is Ganrisankar, of the Himalayas, which rises 8,840 metres above the sea. The five next highest belong also to Asiatic orography. The seventh highest mountain and the six following it in order are found in South America. The highest has an altitude of 7,010 metres. In Africa is found the fourteenth in rank, Kilima-N'daro, 5,705 metres. In North America, Popocatepetl, in Mexico, has a height of 5,410 metres. The highest mountain in Europe, Mont-Blanc, is 4,810 metres, and Mount Ophir, in Oceania, 4,222 metres in height. The highest pass in the world is Sanghi-Davan, in Asia (6,685 metres). The highest inhabited place is Kursok, also in Asia, which is situated at an altitude of over 4,000 metres.

The exploration of the Beni and other rivers of Bolivia and the wide region of unknown country through which they wind, in which labor the late Professor Orton lost his life, has since his death been continued by Dr. Edwin R. Heath. He started September 27, 1880, on a canoe-voyage down the Beni from Cabinas, a rubber-camp on the Madidi, which enters the Beni from the left. He discovered a new affluent of the Beni from the south, on October 8th, and on the same day he reached the confluence of the Beni and Madre de Dios. The breadth of the Madre de Dios is about 735 feet, and that of the Beni at this point 2,350 feet. A little below he passed the mouth of an unknown river, of about the size of the Yacuma, entering the Beni from the north. He passed a number of large islands, and farther on came to some rapids and a cataract 30 feet high. Other rapids were encountered farther down, and on the 11th of October he reached the junction of the Mamoré with the Beni. He ascended the latter river in his canoe for 300 miles to Exaltacion and Santa Ana, and thence crossed the pampas to Reyes. The cannibal Pacavara Indians have been supposed to inhabit the banks of the Beni in great numbers, and India-rubber traders have on that account avoided using this natural highway. They have taken their merchandise instead 200 miles up the river to Reyes and then 200 miles across the pampas to the Mamoré. Dr. Heath encountered only four families of Pacavaras on the Beni, from the confluence of the Madidi to its mouth. With the exception of the party conducted by

F. Maldonado, a Peruvian traveler, who with three of his companions was drowned in the rapids, in 1861, Dr. Heath was the first white man to behold the mouth of the Madre de Dios.

Lieutenant Bove has been unable to obtain sufficient funds from the Italian Government and people to execute his project of Antarctic exploration, and has abandoned the object for the present. He has undertaken instead the exploration of the coast-regions of Patagonia and Tierra del Fuego for the Government of the Argentine Republic. Dr. Venciguerra accompanies him as zoölogist, Professor Lovisato as geologist, and Lieutenant Roncagli as ethnologist.

GEORGIA. The vote of Georgia at the presidential election in 1880 was 102,470 for Hancock, 54,086 for Garfield, and 969 for Weaver. The total vote was 157,525, and the Democratic majority for Hancock over Garfield 48,384. The electors thus chosen were required by the act of Congress to meet in the Capitol of the State on the first Wednesday of December ensuing, and cast their votes for President and Vice-President, but, under the State law, they did not meet until the second Wednesday. Under these circumstances the question arose whether the vote of the State could be counted. The difficulty was finally avoided by the joint rule of the two Houses of Congress regulating the electoral count, which provided that if it should appear from the certificate that the vote of any State was cast on a day other than that provided for casting such votes by act of Congress, pursuant to the Constitution, the result of such certificate should not be recorded until it should appear whether the counting or omitting to count such votes would change the result of the election. Under this rule the vote of Georgia, in the joint convention on the 9th of February, was not recorded in its order, and the result of the count was announced as follows:

The tellers report that the whole number of electors appointed to vote for the President of the United States was 369, of which the majority is 185. Were the votes of the electors for the State of Georgia cast on the second Wednesday of December, 1880, being the 8th day of said month, to be counted, the result would be, for James A. Garfield, of Ohio, for President of the United States, 214 votes, and for Winfield S. Hancock, of Pennsylvania, for President, 155 votes. If not counted, the result would be, for James A. Garfield 214 votes, and for Winfield S. Hancock 144 votes. In either event James A. Garfield has received a majority of the votes of the whole number of electors appointed.

A similar announcement was made respecting the vote for Vice-President.

The question of the constitutionality of the Railroad Commission established by the Legislature was settled early in the year by the decision of Judge Woods in the case of Tilly vs. The Railroad Commission, in the United States Circuit Court. The main points decided in that case are:

1. That, independent of the Constitution of 1877,

the right of railroads to establish their own schedules of freights and fares is subject to legislative control, where such railroads are operating under charters obtained since January 1, 1863—that is, since the adoption of the code.

2. That the Legislature, under the Constitution of 1877, not only has the power, but it is its duty, to regulate the freights and fares of all railroads in this State, no matter when incorporated, so far as to make them just and reasonable, and to prevent unjust discrimination.

3. That to appoint a commission for that purpose is not a delegation of legislative power, but is the employment of the proper agency to regulate freight and passenger tariffs.

4. That the act creating the Railroad Commission of this State is not obnoxious to the Constitution of the United States or the Constitution of Georgia, and is therefore constitutional.

A State Temperance Convention met at Atlanta on the 4th of July, and adopted the report of a committee which recommended “that this convention ask the General Assembly to pass an act forbidding and prohibiting the manufacture, sale, or furnishing of any and all intoxicating or malt liquors, except for medicinal, manufacturing, or sacramental purposes, under proper restrictions.

“That the manufacture and sale of all intoxicating or malt liquors is a nuisance, an unequalled curse to the people and State; but, whenever any county, city, town, or militia district shall or may desire to establish a distillery for the purpose of manufacturing intoxicating or malt liquors, or to sell any malt or spirituous liquors, they may petition the ordinary of the county, who shall order an election to be held as in case of election for members of the General Assembly, upon giving thirty days’ notice thereof, at which election all the qualified voters within the county, city, town, or militia district shall be entitled and authorized to vote. That the tickets shall be indorsed ‘whisky’ or ‘no whisky’; and should a majority of all the qualified voters living within the county, city, town, or militia district vote ‘whisky,’ then the ordinary or mayor may issue license as prescribed by law.

“That no law shall be passed modifying or repealing any prohibitory or local-option law now of force in this State.

“That a permanent executive committee be appointed by this convention who shall prepare a bill embodying the views of this convention, and that said committee be requested to go before the Legislature and present the bill and make known the wishes of this convention.

“That the president of this convention be chairman of the executive committee.

“That the executive committee be requested to take charge of the temperance cause in the State, and to adopt such measures as will best unite the active efforts and co-operation of the friends of temperance in Georgia.”

Among the resolutions adopted was the following:

Resolved, That the convention is in favor of having the question of prohibition so presented that any voter

can freely cast his ballot on that question without affecting his allegiance to the political party of his choice.

The executive committee met and adopted the following resolution and address:

Resolved, That a committee of three shall be appointed to urge the necessity of a thorough organization among the temperance people of the State, that the interest of the temperance cause may be more effectually promoted. It shall be the duty of said committee to prepare a simple, inexpensive mode of organization suitable to carry out the general idea of the work that will naturally grow out of the action of the State Temperance Convention, for the use of localities that may desire the benefit of such a uniform society.

ADDRESS.

In obedience to a call made through the public journals of the State, a convention assembled in this city on the 4th inst. to consider the best way to relieve our State of the evils connected with the use and abuse of intoxicating liquors. The convention was composed of representative men from all parts of the State. In their opinions they were conservative, in their plans they were practical, and in their purposes they were fixed and determined. The body in its deliberations was singularly free from unreasonable enthusiasm and unbridled fanaticism. That body, after a calm, thoughtful, and harmonious session, agreed to go, through its committee, before the General Assembly with a bill embodying the features of a local-option law, with the position of parties thereto reversed. It is needless in this address to rehearse the minor details of the bill; they are such as seem best calculated to secure the enforcement of the law and the suppression of the evils of intemperance.

We now call upon the citizens of the State to express their approval of the measure, and to indorse the action of the convention. This they can do by resolutions adopted by neighborhoods, districts, cities, and villages, assembled in their court-houses or academies, or other places of meeting, or by petitions circulated to which their names may be signed, and then give publicity to their action through communications addressed to the secretary of this committee at Atlanta, and to the papers published in their respective counties.

Fellow-citizens, we are near to the victory! The evil in all its magnitude has been apprehended by the men and women in our State; the danger of delay is fully appreciated, and the importance of calm, determined action is recognized. The judiciary of the State is right on the question; the press of Georgia favors repressive and restrictive measures; the ministry of our churches are supporting the reformation; the solicitous parents are anxiously watching for a remedy; the unfortunate victims of the wine-cup are appealing for help; the good citizens of every race and color, of all creeds and parties, of all ranks and stations in society, are expecting relief, and the noble women of our grand old commonwealth, with entreaty crystallized in tears and embalmed in prayers, are appealing to the General Assembly to stay the tide, and break and beat back the waves of ruin and sorrow that come like a flood in the wake of strong drink; and God, who enjoins virtue and society upon his intelligent creatures—all—all are on our side.

Be hopeful. Be firm. Be decided; and in the name of peace, and honor, and truth, and manhood, we beseech you make known your requests, and demand an everlasting redemption from the thralldom of the terrible monster who is blighting our fair land with drunkenness, ruin, and infamy.

The Legislature, having 1 Republican and 43 Democrats in the Senate, and 10 Republicans and 165 Democrats in the House, met in adjourned session on the 6th of July, and adjourned on the 27th of September, having

passed 433 bills. On the 12th of July the Governor submitted a brief message. He recommended the reduction of the charge on inspected fertilizers from fifty to twenty-five cents per ton, which he regarded as not only ample for all the needful demands of the Department of Agriculture, but as sufficient for the founding and equipment of an experimental station. He also commended to the attention of the Legislature the approaching centennial celebration at Yorktown, and the International Cotton Exposition to be held at Atlanta.

The committee of the House of Representatives appointed at the last session to visit and inspect the various camps of the penitentiary reported at this session. The camps visited contained 1,203 convicts, employed at farm-labor, railroad-building, mining, and manufacturing. The committee found various abuses, and summarized their conclusions as follows:

1. That the system needs a central authority employed to exercise a supervisory control over all persons, companies, and corporations holding the convicts of this State under lease, or otherwise, as to government, discipline, and management of the convicts, with full power and authority to frame all suitable rules and regulations for the proper government and control of said convicts.

2. Humanity and justice to the convicts require that the State appoint an officer at each camp to stand between the convict and the lessee, and to enforce all rules adopted by the central authority for their discipline and government, and to protect the prisoners from cruel and inhuman treatment.

3. That, as the system exists, in the judgment of the committee, there is nothing in it that tends to the reformation of the criminal. It impinges with a crushing force upon the great work of the moral regeneration of the prisoners. The old felon, who has led a life of sin and degeneracy, continues in the practice of his immoralities. The youthful convict is chained by his side day after day and night after night, and is compelled to serve out his sentence under the pale of this evil influence. He naturally contracts the habits and vices of his companion, and, at the end of his time, instead of being a reformed man, he is turned loose on the country and society trained in habits and practices that are destructive to everything which may be called good.

An act was passed on this subject which provides for the appointment of an assistant keeper of the penitentiary, at a salary of \$1,200 a year and traveling expenses. Either the assistant or the principal keeper shall visit each camp once every month and report to the Governor. If they find that the lease has been violated in any respect, the Governor is directed at once to institute proceedings to have the lease of the offending lessee forfeited, and the Attorney-General is directed to represent the State in these prosecutions. All persons are forbidden whipping any convict, except the regular whipping-boss, who is to be appointed by the lessees of each camp, his appointment to be confirmed by the Governor. Upon the discharge of each person, he is to be furnished with a suit of citizen's clothes, and provided with transportation and expenses back to the county from which he was sentenced.

Another act makes important changes in the

usury law. The maximum charge is still fixed by law at eight per cent, but under the new bill the lender has the right to charge whatever rate the borrower agrees upon, and can collect the same if the borrower does not appeal to the law against paying. If this is done, the lender is mulcted only for the surplus of the interest above eight per cent, and not for the entire interest, as under the present law. It also becomes incumbent upon the borrower to show that the lender has violated the law, and it does not devolve upon the lender the burden of proof as under the present law.

Perhaps the most important legislation of the session was a general railroad law, by which charters can be obtained by the filing of articles of incorporation.

While no general temperance bill of importance was passed, the sale of liquor was prohibited in a great many counties, by reason of the increase of the license-tax to such a figure as can not be paid. The sale of liquor is now prohibited in forty-eight counties. Prohibition was asked for a great many other counties, but was killed or postponed by amendments which allow the people of the various townships and districts to vote whether or not the sale of liquor shall be prohibited. The temperance people, on the other hand, gain a great deal in the prohibition of the sale of liquor within a certain number of miles of certain churches, colleges, and academies, and altogether the session resulted in very materially enlarging the circle of prohibition.

Other acts passed were the following: To define the rights and powers of purchasers of railroads; to establish a system of public schools for Rome; to prohibit the employment of minors in any place where intoxicating liquors are sold, to be drunk on the spot; to secure uniformity in grading teachers of public schools; to incorporate the Covington and South River Railroad; to incorporate the Logansville Railroad; to amend section 1312 of the code, fixing the time of meeting for presidential electors; to declare persons who can not read and write incapable of serving as election managers; to reapportion the House of Representatives of this State; to provide for the more efficient granting of diplomas by medical colleges; to incorporate companies formed for steam navigation in ocean or rivers; to incorporate the Georgia Southern and Florida Railroad Company; to regulate the practice of medicine in Georgia; to incorporate the Gainesville, Blairsville and State Line Railroad; to fix the time of elections for the General Assembly; to incorporate the Cumming and Suwannee Railroad Company; to incorporate the Springs Railroad Company; to incorporate the Monticello and Trans-Ocmulgee Railroad Company; to enable the trustees of the State University to inaugurate a system of free tuition; to incorporate the Brunswick and Flint River Railroad Company; to construct a line from Elberton to intersect the New

York and New Orleans Railroad; to incorporate the Rome Southern Railroad Company; to charter the Middle Georgia Railroad; to incorporate the Covington and North Georgia Railroad; to incorporate the Dahlonega, Dawsonville and Gainesville Railroad Company; to authorize a railroad from Covington to the Ocmulgee River; to provide for registering the voters of Savannah; to incorporate the Greenville and White Sulphur Springs Railroad Company; to incorporate the Kingston, Walesca and Gainesville Railroad; to incorporate the Elberton and Point Peter Railroad; to incorporate the Elberton and Petersburg Railroad; to incorporate the Cedartown Railroad Company; to incorporate the Etowah and Blue Ridge Railroad Company.

The following is a list of all the towns in the State that have a population of over 1,000—thirty-nine in number:

RANK.	CITIES AND TOWNS.	1880.	1870.
1	Atlanta.....	87,409	21,759
2	Savannah.....	80,709	28,235

37	Warrenton.....	1,022	620
38	Waynesboro.....	1,008	818
39	Talbotton.....	1,008	796

This table shows that the five largest towns of the State—Atlanta, Savannah, Augusta, Macon, and Columbus—are increasing faster than the remainder of the State. These towns now contain 112,880 people, against 83,624 in 1870—a gain of about forty per cent, against thirty per cent in the entire State.

The census of 1880 shows a large increase in the number of farms, indicating a progressive tendency toward subdivision. The number of farms in Georgia, in 1850, was 51,759; 1860, 62,003; 1870, 69,956; 1880, 138,626, of which 76,451 were cultivated by the owners, 18,557 by tenants at a fixed rental, and 43,618 on shares. The State produced, in the census

year, 814,441 bales of cotton on 2,617,138 acres. The average production per acre is highest in upper Georgia, and decreases through middle and lower Georgia. The following are the chief cotton counties:

Burke, 29,172 bales; Washington, 23,058; Houston, 19,099; Troup, 18,655; Coweta, 16,282; Meriwether, 15,154; Hancock, 15,010; Floyd, 14,545; Jefferson, 13,377; and Cobb, 13,092 bales. This list comprises all the counties that produced more than 13,000 bales. Bartow, Greene, Gwinnett, Harris, Henry, Monroe, Oglethorpe, Pike, Stewart, Sumter, Talbot, Walton, and Wilkes, are each credited with more than 10,000, but less than 13,000 bales.

In the manufacture of cotton Georgia had 200,974 spindles, employing 6,678 hands, and using 67,874 bales.

The average production of wheat was only 6.64 bushels per acre, and of corn 11 bushels. It appears from the census that the chief corn-producing counties were Burke, 505,290 bushels; Gwinnett, 470,409 bushels; Washington, 411,499 bushels; Cobb, 406,730 bushels; and Floyd, 405,290. The product of the State was 23,202,018 bushels, from 2,538,733 acres of land.

Of oats, Brooks produced 163,862 bushels; Thomas, 158,467; Wilkes, 133,277; Houston, 121,261; Coweta, 106,331; Lowndes, 102,276. The product of the State was 5,548,743 bushels, and the acreage 612,788.

The production of rye in the State was small, although well distributed, nearly every county adding something to the crop. Union contributed 9,132 bushels; Fannin, 8,050; Rabun, 6,811; Towns, 6,669; Washington, 5,456, and Wilkinson, 3,790. In the State, 101,716 bushels were grown on 25,854 acres.

The foremost wheat county of the State was Bartow. Its product was 131,935 bushels. Then come Gordon with 113,222 bushels; Cobb, 80,617; Coweta, 77,075; Carroll, 74,826; and Gwinnett, 74,795. The State produced 3,159,771 bushels. The acreage was 475,684.

No coal was mined in Georgia in 1869, but in 1880 about 100,000 tons were produced.

In the latest report of the Commissioner of Public Schools, issued during the year, there is a summary of the school-work of the State since the foundation of its school system, as follows:

In 1871, white pupils, 42,914; colored, 6,664; total, 49,579. In 1873, white, 63,922; colored, 19,755; total, 83,677; increase over the attendance of 1871, 34,099. In 1874, white, 93,167; colored, 42,374; total, 135,541; increase over the attendance of 1873, 51,864. In 1875, white, 105,990; colored, 50,385; total, 156,394; increase over the attendance of 1874, 20,808. In 1876, white, 121,418; colored, 57,987; total, 179,405; increase over the attendance of 1875, 23,011. In 1877, white, 128,296; colored, 62,330; total, 190,626; increase over the attendance of 1876, 11,221. In 1878, white, 137,217;

colored, 72,655; total, 209,872; increase over the attendance in 1877, 19,246. In 1879, white, 147,192; colored, 79,435; total, 226,627; increase over the attendance in 1878, 16,755. In 1880, white, 150,134; colored, 86,429; total, 236,563; increase over the attendance in 1879, 9,936.

The work of 1880 was accomplished on an appropriation by the State of only \$185,789, or much less than one dollar a scholar. The county school commissioners received in addition to this sum about \$160,000—the net proceeds of the poll-tax, making the total amount paid by the people toward the support of schools \$315,748, or seventy-three cents a head of the school population, \$1.39 of the enrollment, and \$2.39 of the average attendance. Commissioner Orr estimated that the receipts on account of the liquor-tax might swell the State appropriation of the current year to \$380,000, which would be about eighty-eight cents for each child in the State within the school ages. The appropriations of certain cities and counties that maintain schools under local laws amount to about \$150,000—making the total appropriation in the State toward the maintenance of public schools \$530,000. The school population is 433,444.

The railroads of Georgia are 2,616 miles long, and cost \$49,676,723. The capital stock stands at \$31,380,615; the funded debt at \$23,033,200, and other debts at \$1,103,527—total, \$55,517,342. The Georgia roads earned in 1880 \$8,419,626, the net earnings being \$3,429,013, of which \$1,051,111 was paid out as interest on bonds, and \$1,619,936 as dividends on stock. Several important railroad enterprises connected with the State were initiated during the year.

The Cincinnati and Georgia syndicate was organized in New York in May, with a capital of \$16,000,000. The company purchased the Macon and Brunswick system in Georgia; the Selma, Rome, and Dalton in Alabama; the East Tennessee and Virginia in the States named, and a lease of the Memphis and Charleston, and will build at a cost of about \$7,000,000 several lines of road to connect the purchased properties into one system. The work on the connections was at once begun, and when finished will give the syndicate a cart-wheel system, the hub being at Chattanooga and the spokes penetrating the richest sections of the South in five directions, and finding termini at Bristol, in Tennessee, the Mississippi River at Memphis, at Meridian, where the Southwestern roads end, and the Atlantic Ocean at Brunswick and Savannah.

The Georgia Pacific syndicate was organized to build from Atlanta to Birmingham, Alabama, through the coal and iron fields of Alabama, heretofore virtually unpenetrated, and thence to the Mississippi River. General John B. Gordon, who resigned his senatorship to give himself to such enterprises, is president of the company.

The Erlanger syndicate, made up of Frankfort capitalists, owned the Alabama and Great Southern road, and purchased the Brunswick and Albany road of Georgia, the Vicksburg and Shelbyville, and the Vicksburg and Meridian roads, at a cost of \$10,800,000. This company will build 320 miles of new roads. When completed, its system will stretch from New Orleans to Chattanooga northward and coastward, and from New Orleans to Brunswick, Georgia.

The Richmond and Danville syndicate controls the organization of the Richmond and Danville road, is interested in the Georgia Pacific, and has bought the Columbia and Green-

ville system of roads, aggregating 297 miles, and costing \$16,000,000; the Charlotte, Columbia and Augusta road, costing \$1,300,000; the Western and North Carolina road, costing, with its extension, over \$4,000,000, and \$1,000,000 to finish it; and the New York river road, costing, with its extension, \$1,500,000. The company is now engaged in extending the Northwestern road from Athens, Georgia, to Knoxville, Tennessee, which will cost \$4,000,000.

The population of the State by counties, as finally returned by the census of 1880, and as compared with the returns of 1870, is as follows:

COUNTIES.	1880.	1870.	COUNTIES.	1880.	1870.	COUNTIES.	1880.	1870.

(For the details of the Atlanta Exposition, see EXPOSITION, INTERNATIONAL COTTON, ATLANTA.)

GERMAN IMPERIAL PARLIAMENT, THE. This Parliament consists of the Bundesrath or Federal Council, and the Reichstag or Diet of the Empire. The Federal Council represents the individual states of Germany, and the Diet the German nation. The members of the Federal Council, fifty-nine in number, are appointed by the governments of the individual states for each session, while the members of the Diet, three hundred and ninety-seven in

number, are elected by universal suffrage for the term of three years. Both bodies meet in annual session, convoked by the Emperor. He has the right to prorogue and dissolve the Diet, but the prorogation must not exceed sixty days; while in case of dissolution new elections must take place within sixty days, and a new session open within ninety days. An absolute majority of both Houses is necessary to pass all laws for the empire. The Federal Council is presided over by the Imperial Chancellor, while the President of the Diet is elected by the deputies.

The Federal Council, acting under the Chancellor, represents in addition to its legislative functions a supreme administrative and consultative board, and as such has seven standing committees, as follows: for army and navy; tariff, excise, and taxes; trade and commerce; railroads, posts, and telegraphs; civil and criminal law; financial accounts; and foreign affairs. Each committee consists of representatives of at least four states of the empire, while the Committee on Foreign Affairs includes only the representatives of the kingdoms of Prussia, Bavaria, Saxony, and Württemberg.

The question of creating a Parliament was one of the most difficult that presented itself to German statesmen upon the creation of the North German Confederation, the institutions of which were almost entirely adopted by the German Empire. There was a time when the idea of a National German Parliament was cherished by the greatest minds as well as by the masses of Germany. It is not to be wondered at, however, that the enthusiasm, which greeted the creation of the German Reichstag and before it the German Customs Parliament, has been succeeded by criticism and even in some quarters by open hostility. The question whether a Parliament is necessary for the development of national life in Germany, is thought by German writers* to be best answered by a review of Bismarck's German policy previous to the North German Confederation. His strongest blow against the old Bundestag or Federal Diet was to demand a National Assembly elected by the direct vote of the people. This demand, made by the Prussian ministry in 1863, was repeated by the resolution offered by Prussia in the Federal Diet in 1866. It really seemed as if no other way was open to bring about German unity, than by the co-operation of the entire nation, and the best means by which to secure this was by a direct representation of the people. Furthermore, this plan offered a sufficient protection against the distinct tendencies of the several states. The question as to the manner of carrying out this plan offered from the beginning serious difficulties. The demand for a correct application of the double-Chamber system, which was made in the beginning, is no longer heard, and the Bundesrath, in its double function as Upper House and a part of the executive, is but little objected to. The application of the most democratic of all electoral systems, that of a general franchise to the election of the Imperial Diet, was met with strong objections from the very beginning. In spite of all opposition, Bismarck introduced this system upon the creation of the North German Confederation, copying almost verbally the electoral law of April 12, 1849, of the Frankfort National Assembly. The only other system which could have been adopted under the then existing circumstances, that of an indirect election by means of electors, was desig-

nated by Bismarck himself as the very worst possible. The demand for the abolition of the general franchise, which has been heard on several occasions, has of late practically ceased. It has been opposed by the argument that it would be very unwise to change the political system of the country after so short a time. The same argument is brought forward against the demand to increase the age at which the Germans acquire the right to vote from twenty-five to thirty years.

Considerable opposition has been raised against the present composition of the Diet. It has been stated that there was great danger from demagogues and monopolies, and that too many deputies make a business of their office, and are in the way of the true representatives of the people. Prince Bismarck has complained that, after new elections, he sees on the whole the same faces as before. This, however, is a poor argument, for it is not to be expected that a people will change its representatives every three years. The majority of the complaints of the present composition of the Diet come from the official organs of the Government, and there can be but little doubt that Prince Bismarck, by bringing forward these questions, desires to destroy the old parties, and to secure the devoted majority which he has desired for so long a time. To a certain degree he has been successful in the disintegration of parties. The so-called German Conservative party has always been a mixture of agrarians and devoted adherents of the Government, and it is a matter of course that it should be a government party. The Free Conservative Imperial party has been divided during the past year by the new policy of the Chancellor. The same policy has separated from the National Liberals the protectionist group of Völk-Schauss, and to a certain extent the free-trade group of Bamberger-Forekenbeck. The immediate future will show whether this process of disintegration will continue. But, whether it will continue or not, it can not be foreseen now how Prince Bismarck's compact majority is to be formed. A chaos of the different groups appears much more probable. Prince Bismarck certainly sees the danger arising from such a condition for the young empire. No doubt, however, he considers himself able to mold such a chaos according to his will. In other words, the protection against the dangers of a general franchise is not to be found, according to Bismarck, in independent and strong political parties, but in a strong government which rules everything—a government which contends against the social elements striving to gain the mastery over the state, by making itself their leader, and then leading them according to its will, and thus making them subsidiary to its interests. It is no secret, how little sympathy Prince Bismarck has for a strong Reichstag. Even when he was in the fullest accord with the Parliament, he carefully avoided the grant to it of new privileges or the extension of

* "Unsere Zeit."

old ones. He has even brought forward several bills that had for their object a direct diminution of the influence and independence of Parliament, which the latter had the courage to reject. It is a question, however, whether future attempts in the same direction will have the same result. Even now the question is frequently heard, What is the use of a Parliament while the Chancellor, assisted by a commission of experts in the various branches of the government, takes care of the welfare of the people? But it is thought in Germany that the attacks of Bismarck are directed not so much against the form of the parliamentary system as against its independence, and this can be prevented by Parliament itself. The relative strength of the parties in Parliament, with its Center composed of clerical and distinctive elements, and numbering about one hundred members, will prevent, on the one hand, Prince Bismarck from securing a majority entirely devoted to him and his plans, which would make of Parliament a mere machine to carry out the Chancellor's wishes, while at the same time it will make a real parliamentary government an impossibility. It is to be expected that the party strife, which has been a characteristic feature of the German Parliament in the past, will continue in the future.

GERMANY, an empire in Europe, re-established January 18, 1871. The Emperor, Will-

iam I, was born March 22, 1797, and was married June 11, 1829, to Augusta, daughter of the Grand Duke Charles Frederick of Saxe-Weimar. The heir-apparent, Frederick William, born October 18, 1831, has the official titles of Crown Prince of the German Empire and Crown Prince of Prussia. He was married January 25, 1858, to Victoria, Princess Royal of Great Britain and Ireland, born November 21, 1840, and has six children, viz.: Frederick William, born 1859, married in 1881 to Princess Victoria of Schleswig-Holstein-Augustenburg; Henry, born 1862; Charlotte, born 1860, married in 1878 to Bernhard, hereditary prince of Saxe-Weimar; Victoria, born 1866; Sophia, born 1870; and Margaretta, born 1872. One son, Waldemar, born in 1868, died March 27, 1879. Imperial Chancellor (*Reichskanzler*), Otto, Prince von Bismarck-Schönhausen.

The German Empire consists at present of twenty-six states, of which four are kingdoms, six grand duchies, five duchies, seven principalities, three free cities, and one, Alsace-Lorraine, an imperial province (*Reichsland*). The area of the German Empire in 1880 was 540,497 square kilometres, or 208,687 English square miles. The following table exhibits all the states of the German Empire, the area, the population according to the census of 1880, the number of representatives of every German state in the Federal Council, and the number of deputies who represent each state in the Reichstag:

STATES.	Area in square kilometres.	Population in 1880.	Votes in the Federal Council.	Deputies in Parliament.
1. Prussia (including Lauenburg).....	343,257.59	27,251,067	17	296

25. Hamburg.....	400.78	454,041	1	3
26. Alsace-Lorraine.....	14,508.10	1,571,971	1	15
Total.....	540,496.74	45,194,172	58	897

In the following table will be found the full exhibit of the governments of the particular states, including the names and the titles of all the sovereign princes, their years of birth and accession to the thrones, and the names of the heirs-apparent. It will be seen that the ducal line of Brunswick is likely to become extinct by the death of the reigning Duke.

The succession is disputed by the Duke of Cumberland (son of the late King of Hanover) and the Emperor of Germany. It is also interesting to notice that the heir-apparent is the son of the reigning sovereign in only thirteen of the twenty-two sovereign houses which belong to the German Empire; in the others he is the cousin, brother, or nephew.

STATES.	Title.	Name.	When born, and when succeeded to the government.	Heir-apparent.
Prussia.....	King.....	William I.....	Born 1797, succ. 1861...	Frederick William, son.

The following table shows the growth of the population of the German Empire within its present limits since 1816 :

YEAR.	Population.	Average annual increase.
1816.....	24,831,396	1.48 p. c.
1820.....	26,291,606	0.96 "
1830.....	29,515,125	1.16 "
1840.....	32,735,150	0.57 "
1850.....	35,895,496	0.88 "
1860.....	37,742,157	0.58 "
1870.....	40,316,249	0.92 "
1875.....	42,727,860	1.12 "
1880.....	45,194,172	

The total emigration from Germany from 1875 to 1880 was as follows :

YEARS.	Via Bremen.	Via Hamburg.	Via Stettin.	Via Antwerp.	Total.
1875.....	12,613	15,826	268	2,066	30,778
1876.....	10,972	12,706	202	4,488	28,368
1877.....	9,328	10,725	75	1,836	21,964
1878.....	11,329	11,827	85	976	24,217
1879.....	15,828	13,165	245	4,089	33,327
1880.....	51,627	42,757	552	11,224	106,190
Total.....	111,697	107,086	1,427	24,679	244,839

The number of emigrants who went by way of Havre was, in 1879, 9,856 ; in 1880, 10,757 ; from 1871-'80, 30,494. The destination of these 244,839 emigrants was as follows :

YEARS.	United States.	Brazil.	Other countries of America.	Australia.	Africa.	A. in.
1875.....	27,884	1,357	483	1,026	1	37
1876.....	22,767	3,432	858	1,226	54	31
1877.....	18,240	1,069	568	1,306	750	81
1878.....	20,373	1,043	634	1,718	894	50
1879.....	30,308	1,630	561	274	23	31
1880.....	103,115	2,119	761	132	27	86
Total..	223,187	10,685	3,870	5,682	1,249	216

The movement of population in 1879 was as follows:

STATES.	Marriages.	Births. Deaths.		Still-births.	Surplus of births.
		Incl. of still-births.			
Prussia.....	206,752	1,096,385	711,322	44,752	385,063
Bavaria.....	85,067	215,281	162,479	7,220	52,502
Saxony.....	25,230	180,750	86,598	5,301	44,157

Baden.....	10,469	59,382	43,322	1,843	16,000
Alsace-Lorraine.....	9,705	53,657	42,382	1,959	11,305
Hesse.....	6,328	83,788	22,160	1,411	11,628
Other states.....	28,827	183,497	85,557	5,327	47,910
Total.....	335,113	1,806,741	1,214,643	70,870	592,098

The budget of the German Empire for 1881-'82, according to the law of March 28, 1881, estimates the revenue and expenditure at 592,956,554 marks each (1 mark = 23·8 cents). The revenue was derived from the following sources:

	Marks.
1. Customs and excise.....	335,490,150
2. Stamps on playing-cards.....	1,100,000
3. Stamp-duty on bills of exchange.....	6,106,900
4. Statistical dues.....	800,000
5. Post-Office and telegraphs (net).....	18,697,145
6. Railroads (net).....	11,039,400
7. Imperial printing-office.....	1,061,520
8. Imperial and other banks.....	1,505,430
9. Miscellaneous receipts.....	5,315,501
10. From the imperial funds for invalids.....	31,071,344
11. Surplus of former years.....	6,629,730
12. Interest from invested capitals.....	8,542,650
13. Extraordinary receipts.....	67,108,806
14. Matricular contributions.....	103,283,523
Total.....	592,956,554

The expenditures of the empire were estimated as follows (in marks):

EXPENDITURES.	Ordinary.	Extraordinary.
1. Imperial Parliament.....	403,770
2. Chancellor of the Empire and Imperial Chancery.....	125,770
3. Foreign Affairs and consulates.....	6,564,890	181,400
4. Department of the Interior.....	2,343,692	894,605
5. Posts and Telegraphs.....	9,159,122
6. Imperial Printing-Office.....	30,000
7. Army.....	342,190,985	51,130,733
8. Navy.....	27,518,326	11,873,558
9. Administration of Justice.....	1,700,852	200,000
10. Imperial Treasury.....	69,461,836	8,680,766
11. Imperial Railroad-Office.....	803,150
12. Public debt.....	10,602,500	110,000
13. Chamber of Accounts.....	465,433	8,000
14. Administration of Railroads.....	8,388,064
15. Pensions.....	13,399,993
16. Expenses arising from the war with France.....	1,698,245
17. Imperial invalid fund.....	31,071,344
Total.....	511,652,061	81,304,493
	592,956,554	

The public debt of the German Empire consists of three loans, one of 77,731,321 marks (authorized by the law of June 14, 1877), one of 97,484,865 marks (law of June 14, 1878), and one of 68,021,071 marks (law of June 13, 1879), of which there had been issued up to February 1, 1881, 251,000,000 marks. In accordance with the laws of July 9, 1879, March 26, 1880, March 28, 1881, and May 24, 1881, a new loan amounting to 102,540,008 marks had been contracted. There is also a floating debt consisting of Treasury notes issued for short

periods only. In accordance with the law of April 20, 1874, the Imperial Government has issued paper money (*Reichscassenscheine*) to the amount of 120,000,000 marks, which has been distributed among the several states in proportion to their population on December 31, 1871. The same law authorized the issue of paper money to the amount of 54,889,940 marks to facilitate the carrying out of the reform in the coinage. The amount in circulation on April 1, 1881, was 155,785,540 marks.

The military forces of the empire in time of peace are as follows:

DIVISIONS.	Officers.	Men.	Horses.
1. Staff.....	2,014	4
Infantry of the line.....	9,532	278,826
Chasseurs.....	424	11,120
Landwehr.....	343	4,763
2. Infantry.....	10,304	294,709
3. Cavalry.....	2,359	64,699	62,551
Field artillery.....	1,801	34,817	16,591
Foot artillery.....	726	16,349
4. Artillery.....	2,527	51,166	16,591
5. Pioneers.....	412	10,838
6. Train.....	200	4,905	2,457
7. Special formations.....	313	953
Total.....	18,128	427,274	81,269

This number was divided as follows among the different states:

STATES.	Officers.	Men.	Horses.
Prussia (inclusive of smaller states).....	14,004	330,629	64,167
Bavaria.....	2,214	50,224	8,586
Saxony.....	1,187	27,606	5,183
Württemberg.....	773	18,815	3,443
Total.....	18,128	427,274	81,269

The following table gives the military forces of the empire in time of war (exclusive of the Landsturm):

I. FIELD ARMY.

DIVISIONS.	Officers.	Men.	Horses.
Higher staff.....	863	5,170	5,070
Infantry.....	11,760	498,617	20,860
Jägers.....	440	20,520	800
Cavalry.....	2,140	59,814	55,608
Artillery.....	2,538	59,260	87,702
Pioneers.....	649	24,820	10,739
Train.....	755	43,004	50,772
Administration.....	216	2,826	10,564
Total.....	19,391	744,031	242,415

II. RESERVES.

DIVISIONS.	Officers.	Men.	Horses.
Substitutes of the staff.....	875	1,836	320
Infantry.....	3,128	228,298	1,136
Jägers.....	80	6,860	20
Cavalry.....	465	23,994	19,717
Artillery.....	406	16,879	6,220
Pioneers.....	95	6,960	20
Train.....	247	12,287	3,980
Total.....	4,796	296,614	81,373

III. GARRISON.

DIVISIONS.	Officers.	Men.	Horses.
Offices *	850	10,000	1,850
Infantry	7,896	814,438	2,513
Jägers	80	4,020	20
Cavalry	828	22,963	25,850
Artillery	1,458	58,174	0,180
Pioneers	128	6,432
Total garrison	11,240	416,082	88,948
" reserves	4,796	296,614	81,873
" field army	19,891	744,031	242,415
Grand total	35,427	1,456,677	812,731

The empire is divided for military purposes into seventeen districts, each represented by one *corps d'armée*.

The illiteracy among the recruits during the past five years was as follows:

YEAR.	Number of recruits examined.	Number of illiterates.	Percentage of illiterates.
1876	140,197	2,975	2.12
1877	142,957	2,476	1.73
1878	143,119	2,574	1.80
1879	140,881	2,217	1.57
1880	151,180	2,406	1.59

The only parts of Germany which furnished a considerable number of illiterates were the Prussian provinces of East Prussia (7.02 per cent), West Prussia (8.75 per cent), Posen (9.91 per cent), the district of Oppeln (4.33 per cent), and Alsace-Lorraine (2.24 per cent). All other parts fall far short of the average rate of the empire.

The German navy was composed as follows in 1881:

VESSELS.	Num-ber.	Guns.	Tons.	Horse-power.
I. AFLOAT.				
1. Steamers—ironclads:				
Frigates	7	85	50,224	43,100
Corvettes	5	32	33,210	25,400
Batteries	1	4	1,588	1,200
Gunboats	11	11	12,199	7,700
Total ironclads	24	132	97,016	77,400
Frigates	11	177	31,094	30,000
Corvettes	7	64	11,448	18,400
Dispatch-boats	7	22	5,562	7,000
Gunboats	11	33	4,765	8,650
Torpedo-vessels	10	4	1,974	3,290
Transport-steamers	2	..	495	320
School-ships	5	73	14,643	7,600
2. Sailing-vessels:				
Frigates	1	10	1,290
Brigs	3	18	1,748
Total	51	538	172,936	142,660
II. IN COURSE OF CONSTRUCTION.				
Corvettes	2	20	4,398	4,200
Dispatch-boats	2	4	2,764	5,400
Tender	1	4	203	160
Total	5	28	7,305	9,760

The commercial navy was as follows on January 1, 1880:

* Including Ministry of War, offices of commanding generals, etc.

STATES.	TOTAL VESSELS.		STEAMERS.		
	Num-ber.	Tons.	Num-ber.	Tons.	Horse-power.
Prussia	3,198	480,890	158	36,798	1,710
Hamburg	451	239,862	41	88,960	3,267
Bremen	320	261,857	67	50,400	2,672
Mecklenburg	391	113,362	11	4,459	146
Oldenburg	849	66,649
Lübeck	48	9,666	27	6,641	336
North Sea fleet	2,788	723,730	195	150,915	6,088
Baltic fleet	1,989	447,556	179	45,428	2,043
Total, 1880	4,777	1,171,286	374	196,343	8,131
" 1879	4,804	1,129,129	351	179,662	52,313
" 1878	4,805	1,117,985	336	183,379	50,603
" 1877	4,809	1,108,650	318	180,946	49,575
" 1876	4,745	1,084,882	319	183,569	50,756

The trade and commerce of the empire are under the administration of the Zollverein, or Customs Union, which embraces the whole of Germany with the exception of those parts whose geographical position seems to make their admission impracticable. In 1881 it included the entire German Empire, with the exception of the free ports of Bremen, Hamburg, Bremerhaven, Geestemünde, Brake, and a small part of Baden, in all 390 square kilometres, with 594,750 inhabitants. It also includes the Grand Duchy of Luxemburg and the Austrian community of Jungholz, in all 542,681 square kilometres, with 42,337,974 inhabitants. The imports and exports for 1879 in the customs territory of Germany were estimated as follows (value in marks—1 mark = \$0.238):

CLASSES OF GOODS.	Imports.	Exports.
Grain	657,700,000	350,000,000
Malt and other liquors	116,500,000	62,600,000
Colonial produce	280,300,000	122,400,000
Tobacco and cigars	110,200,000	8,200,000
Seeds and fruits	125,300,000	77,700,000
Animals and animal provisions	357,000,000	262,500,000
1. Articles of food	1,627,000,000	858,700,000
Fuel	56,900,000	84,200,000
Minerals and ores	73,700,000	94,100,000
Raw metals	57,300,000	83,200,000
Hair, hides, and leather	220,000,000	116,600,000
Spinning material	673,900,000	287,200,000
Wood and timber	167,500,000	70,000,000
2. Raw material	1,249,600,000	685,800,000
Pottery and glassware	18,600,000	55,000,000
Metals	15,700,000	90,500,000
Metal-ware	18,400,000	58,600,000
Machines and vessels	40,500,000	71,600,000
Leather, etc.	18,600,000	61,200,000
Yarn	170,900,000	57,500,000
Cordage, woven goods, and clothing	157,700,000	416,200,000
Caoutchouc and wax goods	7,600,000	15,000,000
Paper	7,100,000	26,100,000
Wood and carvings	15,700,000	43,100,000
Jewelry and art goods	13,700,000	54,900,000
Manuscripts, articles for printing	9,200,000	22,200,000
3. Manufactured goods	491,700,000	971,900,000
4. Miscellaneous goods	404,900,000	234,300,000
5. Precious metals	119,600,000	45,800,000
Total	3,892,800,000	2,821,500,000

The movement of shipping in the German ports was as follows in 1880:

NATIONALITY.	TOTAL.		LADEN VESSELS.		STEAMERS.	
	Vessels.	Tons.	Vessels.	Tons.	Vessels.	Tons.
ENTERED.						
German	36,435	3,295,019	23,603	2,957,474	6,790	1,710,249

Among the foreign papers that can be ordered there are 568 from Paris, 469 from London, 209 from Vienna, 128 from New York, 76 from Brussels, 73 from Copenhagen, 44 from St. Petersburg, 40 from Rome, and 33 from Milan.

The imperial statistical office in September,

1881, published a summary of the result of the tobacco-crop in the German customs territory for the year ending June 30, 1881. This is of particular importance, as this year was the first in which the provisions of the law of July 16, 1879, were carried into effect. The area planted with tobacco was 2,417,594 acres, 690,298 acres more than in the preceding year. This increase is due in a great measure to the unusually high price paid during 1879—viz., 75.40 marks for 100 kilogrammes of dried leaves. The crop in 1880 was a very large one, 51,531,598 kilogrammes, or 2,132 kilogrammes per hectare. Of this amount 15,289,684 kilogrammes were raised in Baden, 13,524,830 kilogrammes in Prussia, 11,028,757 kilogrammes in Bavaria, and 8,025,135 kilogrammes in Alsace-Lorraine. The total value of the crop was estimated at 36,500,000 marks.
